

ADS58J64 クワッド・チャネル、14 ビット、1GSPS テレコム受信機デバイス

1 特長

- クワッド・チャネル
- 14 ビット分解能
- 最大サンプリング・レート 1GSPS
- 最大出力サンプリング・レート 500MSPS
- 高インピーダンス入力のアナログ入力バッファ
- 入力 3dB 帯域幅:1GHz
- 出力オプション
 - Rx:2 および 4 倍のデシメーション・オプションとローパス・フィルタ
 - 200MHz の複合帯域幅、または 100MHz の実帯域幅をサポート
 - DPD FB: 14 ビットのバースト・モード出力による 2x デシメーション
- 1.1V_{PP} の差動フルスケール入力
- JESD204B インターフェイス
 - サブクラス 1 のサポート
 - ADC ごとに 1 レーンで、最高 10Gbps
 - チャネル・ペアごとに専用の SYNC ピン
- マルチチップの同期をサポート
- 72 ピンの VQFN パッケージ (10mm × 10mm)
- 消費電力:625mW/Ch
- スペクトル性能 (バースト・モード、高分解能)
 - 1dBFS において、 $f_{IN} = 190\text{MHz}$:
 - SNR:69dBFS
 - NSD:-153dBFS/Hz
 - SFDR:86dBc (HD2, HD3), 95dBFS (非 HD2, HD3)
 - 3dBFS において、 $f_{IN} = 370\text{MHz}$:
 - SNR:68.5dBFS
 - NSD:-152.5dBFS/Hz
 - SFDR:80dBc (HD2, HD3), 86dBFS (非 HD2, HD3)

2 アプリケーション

- マルチキャリアの GSM 携帯電話インフラストラクチャ 基地局
- マルチキャリアのマルチモード携帯電話インフラストラクチャ 基地局
- テレコミュニケーション受信機
- テレコム DPD 観測受信機

3 概要

ADS58J64 は低消費電力で帯域幅の広い、14 ビット、1GSPS、クワッド・チャネルのテレコム受信機デバイスです。ADS58J64 は JESD204B シリアル・インターフェイスをサポートし、チャネルごとに 1 レーンで 10Gbps までのデータ速度に対応しています。アナログ・バッファ入力により、広い周波数帯域にわたって入力インピーダンスが均一で、サンプルとホールドのグリッチ・エネルギーが最小化されます。ADS58J64 は、広い入力周波数範囲にわたって、非常に優れたスプリアス・フリー・ダイナミック・レンジ (SFDR) を実現し、消費電力も非常にわずかです。デジタル信号処理ブロックには複合ミキサーが内蔵され、その後段のローパス・フィルタにより 2 倍または 4 倍のデシメーションが可能で、最高 200MHz の受信帯域幅をサポートします。ADS58J64 は 14 ビット、500MSPS のバースト・モード出力にも対応しているため、デジタル・プリディストーション (DPD) 観測受信機に適しています。

JESD204B インターフェイスにより、インターフェイス・ラインの数を削減でき、システムの集積密度を高めることができます。内蔵のフェーズ・ロック・ループ (PLL) は、入力されるアナログ/デジタル・コンバータ (ADC) サンプリング・クロックを逡倍してビット・クロックを生成し、各チャネルの 14 ビット・データをシリアル化するために使用します。

製品情報⁽¹⁾

部品番号	パッケージ	本体サイズ (公称)
ADS58J64	VQFN (72)	10.00mm × 10.00mm

- (1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision A (January 2017) to Revision B (December 2021)	Page
• 文書全体にわたって表、図、相互参照の採番方法を更新.....	1
• Added RHH (VQFN) package option.....	3
• Changed description for GAINWORD	62
• Added the text <i>Also need to enable OVR_ON_LSB bit in DIGTOP page</i> to register 3 and 1 of Register 27h in CHX page.....	62

Changes from Revision * (January 2017) to Revision A (January 2017)	Page
• 3 番目の「特長」の箇条書きで、「サンプル」を「サンプリング」に変更.....	1
• 4 番目の「特長」の箇条書きで、「帯域幅:」 「250MHz」を「サンプル・レート:」 「500MSPS」に変更.....	1
• 「特長」セクションに、「入力 3dB 帯域幅」の箇条書きを追加.....	1
• Changed plot and SNR and SFDR conditions of Figure 9	12
• Added <i>for loading trims</i> to description of bit 1 in <i>Register 64h Field Descriptions</i>	44
• Changed <i>select</i> to <i>set</i> in description of bits 7-0 in <i>Register 8Dh Field Descriptions</i> and <i>Register 8Eh Field Descriptions</i>	44
• Changed <i>select</i> to <i>set</i> in description of bits 7-0 in <i>Register 8Fh Field Descriptions</i> and <i>Register 90h Field Descriptions</i>	44
• Added <i>Others: Do not use</i> to Description column of <i>Register 71h Field Descriptions</i> and <i>Register 72h Field Descriptions</i>	49
• Changed <i>Others: Do not use</i> to Description column of <i>Register 93h Field Descriptions</i> and <i>Register 94h Field Descriptions</i>	50
• Added <i>Valid only when CTRL_LID = 1</i> to description of bits 7-4 in <i>Register 2Dh Field Descriptions</i>	57
• Changed Description column of <i>Register 41h Field Descriptions</i>	61
• Changed 1 : to 3 : and added <i>Others: Do not use</i> to Description column of <i>Register 42h Field Descriptions</i>	61
• Changed description of bits 7-0 in <i>Register 07h Field Descriptions</i>	65
• Changed description of bits 7-0 in <i>Register 08h Field Descriptions</i>	65

5 Pin Configuration and Functions

图 5-1. RMP or RHH Package 72-Pin VQFN Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
INPUT, REFERENCE			
INAM	41	I	Differential analog input pin for channel A, internal bias via a 2-kΩ resistor to V_{CM}
INAP	42		
INBM	37	I	Differential analog input pin for channel B, internal bias via a 2-kΩ resistor to V_{CM}
INBP	36		
INCM	18	I	Differential analog input pin for channel C, internal bias via a 2-kΩ resistor to V_{CM}
INCP	19		
INPUT, REFERENCE (continued)			
INDM	14	I	Differential analog input pin for channel D, internal bias via a 2-kΩ resistor to V_{CM}
INDP	13		
CLOCK, SYNC			

表 5-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
CLKINM	28	I	Differential clock input pin for the ADC with internal 100-Ω differential termination, requires external ac coupling
CLKINP	27		
SYSREFM	34	I	External SYSREF input, requires dc coupling and external termination
SYSREFP	33		
CONTROL, SERIAL			
NC	22, 23	—	No connection
PDN	50	I/O	Power down. This pin can be configured via an SPI register setting. This pin has an internal 10-kΩ pull-down resistor.
RES	49	—	Reserved pin, connect to GND
RESET	48	I	Hardware reset; active high. This pin has an internal 10-kΩ pull-down resistor.
SCLK	6	I	Serial interface clock input. This pin has an internal 10-kΩ pull-down resistor.
SDIN	5	I	Serial interface data input. This pin has an internal 10-kΩ pull-down resistor.
SDOUT	11	O	1.8-V logic serial interface data output
SEN	7	I	Serial interface enable. This pin has an internal 10-kΩ pull-up resistor to DVDD.
TRDYAB	54	O	Trigger-ready output for burst mode for channels A and B. This pin can be configured via SPI to a TRDY signal for all four channels in burst mode, and can be left open if not used.
TRDYCD	1	O	Trigger-ready output for burst mode for channels C and D. This pin can be configured via SPI to a TRDY signal for all four channels in burst mode, and can be left open if not used.
TRIGAB	53	I	Manual burst mode trigger input for channels A and B. This pin can be configured via SPI to a manual trigger input signal for all four channels in burst mode, and can be connected to GND if not used. This pin has an internal 10-kΩ pull-down resistor.
TRIGCD	2	I	Manual burst mode trigger input for channels C and D. This pin can be configured via SPI to a manual trigger input signal for all four channels in burst mode, and can be connected to GND if not used. This pin has an internal 10-kΩ pull-down resistor.
DATA INTERFACE			
DAM	59	O	JESD204B serial data output pin for channel A
DAP	58		
DBM	62	O	JESD204B serial data output pin for channel B
DBP	61		
DCM	65	O	JESD204B serial data output pin for channel C
DCP	66		
DDM	68	O	JESD204B serial data output pin for channel D
DDP	69		
SYNCbABM	56	I	Synchronization input pin for JESD204B port channels A and B. This pin can be configured via SPI to a SYNCb signal for all four channels. This pin has an internal differential termination of 100 Ω.
SYNCbABP	55		
SYNCbCDM	71	I	Synchronization input pin for JESD204B port channels C and D. This pin can be configured via SPI to a SYNCb signal for all four channels. This pin has an internal differential termination of 100 Ω.
SYNCbCDP	72		
POWER SUPPLY			
AGND	21, 26, 29, 32	I	Analog ground
AVDD	9, 12, 15, 17, 20, 25, 30, 35, 38, 40, 43, 44, 46	I	Analog 1.15-V power supply
AVDD19	10, 16, 24, 31, 39, 45	I	Analog 1.9-V supply for analog buffer
DGND	3, 52, 60, 63, 67	I	Digital ground
DVDD	4, 8, 47, 51, 57, 64, 70	I	Digital 1.15-V power supply
Thermal pad		—	Connect to GND

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	AVDD19	-0.3	2.1	V
	AVDD	-0.3	1.4	
	DVDD	-0.3	1.4	
	IOVDD	-0.2	1.4	
Voltage between AGND and DGND		-0.3	0.3	V
Voltage applied to input pins	INAP, INBP, INAM, INBM, INCP, INDP, INCM, INDM	-0.3	2.1	V
	CLKINP, CLKINM	-0.3	AVDD + 0.3	
	SYSREFP, SYSREFM, TRIGAB, TRIGCD	-0.3	AVDD + 0.3	
	SCLK, SEN, SDIN, RESET, SYNCbABP, SYNCbABM, SYNCbCDP, SYNCbCDM, PDN	-0.2	AVDD19 + 0.3	
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT	
Supply voltage range	AVDD19	1.8	1.9	2	V	
	AVDD	1.1	1.15	1.2		
	DVDD	1.1	1.15	1.2		
	IOVDD	1.1	1.15	1.2		
Analog inputs	Differential input voltage range	1.1			V _{PP}	
	Input common-mode voltage (VCM)	1.3			V	
Clock inputs	Input clock frequency, device clock frequency		400	1000	MHz	
	Input clock amplitude differential (V _{CLKP} – V _{CLKM})	Sine wave, ac-coupled		1.5	V _{PP}	
		LVPECL, ac-coupled		1.6		
		LVDS, ac-coupled		0.7		
Input device clock duty cycle, default after reset		45%	50%	55%		
Temperature	Operating free-air, T _A		–40	100 ⁽³⁾	°C	
	Operating junction, T _J			105		125 ⁽¹⁾
	Specified maximum, measured at the device footprint thermal pad on the printed circuit board, T _{P-MAX}					104.5 ⁽²⁾

- (1) Prolonged use above this junction temperature can increase the device failure-in-time (FIT) rate.
- (2) The recommended maximum temperature at the PCB footprint thermal pad assumes the junction-to-package bottom thermal resistance, R_{θJC(bot)} = 0.2°C/W, the thermal resistance of the device thermal pad connection to the PCB footprint is negligible, and the device power consumption is 2.5 W.
- (3) Assumes system thermal design meets the T_J specification.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS58J64		UNIT
		RMP (VQFN)	RHH (VQFN)	
		72 PINS	72 PINS	
R _{θJA}	Junction-to-ambient thermal resistance ⁽²⁾	22.3	18.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance ⁽³⁾	5.1	5.8	°C/W
R _{θJB}	Junction-to-board thermal resistance ⁽³⁾	2.4	4.5	°C/W
ψ _{JT}	Junction-to-top characterization parameter ⁽⁴⁾	0.1	0.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter ⁽⁵⁾	2.3	4.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance ⁽⁶⁾	0.2	0.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).

6.5 Electrical Characteristics

typical values are at $T_A = 25^\circ\text{C}$, full temperature range is from $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = +100^\circ\text{C}$, input clock frequency = 1 GHz, mode 8: 2x decimation with burst mode output, 50% clock duty cycle, $\text{AVDD19} = 1.9\text{ V}$, $\text{AVDD} = \text{DVDD} = 1.15\text{ V}$, -1-dBFS differential input, and $f_{\text{IN}} = 190\text{ MHz}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
GENERAL						
ADC sampling rate					1	GSPS
Resolution			14			Bits
POWER SUPPLY						
AVDD19	1.9-V analog supply		1.85	1.9	1.95	V
AVDD	1.15-V analog supply		1.1	1.15	1.2	V
DVDD	1.15-V digital supply		1.1	1.15	1.2	V
I_{AVDD19}	1.9-V analog supply current	100-MHz, full-scale input on all four channels		618		mA
I_{AVDD}	1.15-V analog supply current	100-MHz, full-scale input on all four channels		415		mA
I_{DVDD}	1.15-V digital supply current	Mode 8, 100 MHz, full-scale input on all four channels		629		mA
		Mode 3, 100 MHz, full-scale input on all four channels		730		
		Mode 0 and 2, 100 MHz, full-scale input on all four channels		674		
		Mode 1, 4, 6, and 7, 100 MHz, full-scale input on all four channels		703		
P_{dis}	Total power dissipation	Mode 8, 100 MHz, full-scale input on all four channels		2.37		W
		Mode 3, 100 MHz, full-scale input on all four channels		2.49		
		Mode 0 and 2, 100 MHz, full-scale input on all four channels		2.42		
		Mode 1, 4, 6, and 7, 100 MHz, full-scale input on all four channels		2.46		
Global power-down power dissipation		Full-scale input on all four channels		120		mW
ANALOG INPUTS						
Differential input full-scale voltage				1.1		V_{PP}
Input common-mode voltage				1.3		V
Differential input resistance		At $f_{\text{IN}} = \text{dc}$		4		k Ω
Differential input capacitance				2.5		pF
Analog input bandwidth (3 dB)				1000		MHz
ISOLATION						
Crosstalk ⁽¹⁾ isolation between near channels (channels A and B are near to each other, channels C and D are near to each other)	$f_{\text{IN}} = 10\text{ MHz}$			75		dBFS
	$f_{\text{IN}} = 100\text{ MHz}$			75		
	$f_{\text{IN}} = 170\text{ MHz}$			74		
	$f_{\text{IN}} = 270\text{ MHz}$			72		
	$f_{\text{IN}} = 370\text{ MHz}$			71		
	$f_{\text{IN}} = 470\text{ MHz}$			70		

typical values are at $T_A = 25^\circ\text{C}$, full temperature range is from $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = +100^\circ\text{C}$, input clock frequency = 1 GHz, mode 8: 2x decimation with burst mode output, 50% clock duty cycle, AVDD19 = 1.9 V, AVDD = DVDD = 1.15 V, -1-dBFS differential input, and $f_{\text{IN}} = 190\text{ MHz}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Crosstalk ⁽¹⁾ isolation between far channels (channels A and B are far from channels C and D)	$f_{\text{IN}} = 10\text{ MHz}$		110		dBFS
	$f_{\text{IN}} = 100\text{ MHz}$		110		
	$f_{\text{IN}} = 170\text{ MHz}$		110		
	$f_{\text{IN}} = 270\text{ MHz}$		110		
	$f_{\text{IN}} = 370\text{ MHz}$		110		
	$f_{\text{IN}} = 470\text{ MHz}$		110		
CLOCK INPUT					
Internal clock biasing	CLKINP and CLKINM pins are connected to the internal biasing voltage through a 5-k Ω resistor		0.7		V

(1) Crosstalk is measured with a -1-dBFS input signal on aggressor channel and no input on the victim channel.

6.6 AC Performance

typical values are at $T_A = 25^\circ\text{C}$, full temperature range is from $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = +100^\circ\text{C}$, input clock frequency = 1 GHz, mode 8: 2x decimation with burst mode output, 50% clock duty cycle, AVDD19 = 1.9 V, AVDD = DVDD = 1.15 V, -1-dBFS differential input, and $f_{\text{IN}} = 190\text{ MHz}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	MIN	TYP	MAX	UNIT
		14-BIT BURST MODE (DDC Mode 8)			DECIMATE-BY-4 (DDC Mode 2)			
SNR	Signal-to-noise ratio	$f_{\text{IN}} = 10\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		69.9		72.2		dBFS
		$f_{\text{IN}} = 70\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		69.6		71.8		
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -1\text{ dBFS}$		69.2		71.8		
		$f_{\text{IN}} = 190\text{ MHz}, A_{\text{IN}} = -3\text{ dBFS}$	66.5	69.6		71

7 Detailed Description

7.1 Overview

The ADS58J64 is a quad-channel device with a complex digital down-converter (DDC) and digital decimation to allow flexible signal processing to suit different usage cases. Each channel is composed of two interleaved analog-to-digital converters (ADCs) sampling at half the input clock rate. The 2x interleaved data are decimated by 2 to provide a processing gain of 3 dB. The decimation filter can be configured as low pass (default) or high pass. The half-rate (with regards to the input clock) data are available on the output, in burst mode (DDC mode = 8) as a stream of high (14-bit) and low (9-bit) resolution samples. Burst mode can be enabled by device programming along with other options (such as the number of high- and low-resolution samples, and trigger mode as either automatic or pin-controlled). In default mode, the device operates in DDC mode 0, where the input is mixed with a constant frequency of $-f_s / 4$ and is given out as complex IQ. The different operational modes of the ADS58J64 are listed in [表 7-1](#).

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Inputs

The ADS58J64 analog signal inputs are designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. As a result of the analog buffer, the input pins present a high-impedance input across a very wide frequency range to the external driving source that enables great flexibility in the external analog filter design as well as excellent 50-Ω matching for RF applications. The buffer also helps isolate the external driving circuit from the internal switching currents of the sampling circuit, resulting in a more constant SFDR performance across input frequencies. The common-mode voltage of the signal inputs is internally biased to 1.3 V using 2-kΩ resistors to allow for ac-coupling of the input drive network. Each input pin (INP, INM) must swing symmetrically between ($V_{CM} + 0.275\text{ V}$) and ($V_{CM} - 0.275\text{ V}$), resulting in a 1.1- V_{PP} (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 1000 MHz.

7.3.2 Recommended Input Circuit

In order to achieve optimum ac performance, the following circuitry (shown in [Figure 7-1](#)) is recommended at the analog inputs.

Copyright © 2017, Texas Instruments Incorporated

Figure 7-1. Analog Input Driving Circuit

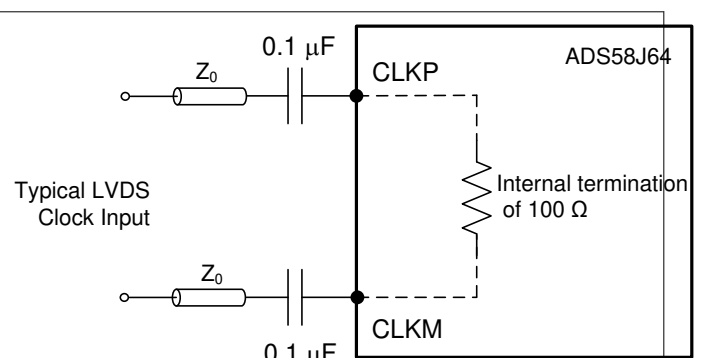

7.3.3 Clock Input

The clock inputs of the ADS58J64 supports LVDS and LVPECL standards. The CLKP, CLKM inputs have an internal termination of 100 Ω. The clock inputs must be ac-coupled because the input pins are self-biased to a common-mode voltage of 0.7 V, as shown in [Figure 7-2](#) and [Figure 7-3](#).

Figure 7-3. LVDS Clock Driving Circuit

7.4 Device Functional Modes

7.4.1 Digital Features

The ADS58J64 has two stages of digital decimation filters, as shown in [Figure 7-4](#). The first stage is mandatory and decimates by 2, and can be configured as either a low-pass or high-pass filter. The second stage decimation supports real to complex quadrature demodulation and decimation by 2 or 4. After decimation, the complex signal can be converted back to a real signal through digital quadrature modulation at a frequency of $f_{OUT} / 4$, where f_{OUT} is the sample frequency after decimation.

Optionally, a burst mode output can be used to output the decimate-by-2 data directly.

The four channels can be configured as pairs (A, B and C, D) to either burst or decimation mode. If all four channels are in decimation mode, then the decimation setting must be the same decimation for all four channels.

All modes of operation and the maximum bandwidth provided at a sample rate of 491.52 MSPS and 368.64 MSPS are listed in [Table 7-1](#). The first stage decimation filter prior to the 16-bit numerically controlled oscillator (NCO) is a noise suppression filter with 45% pass-band bandwidth relative to the input sample rate, less than 0.2-dB ripple, and approximately 40-dB stop-band attenuation. This filter is only used to reduce the ADC output rate from 1 GSPS to 500 MSPS prior to the second stage decimation filter or burst mode. Some analog filtering of other Nyquist zones after the first stage decimation filter is expected to be required.

The second stage filter has a pass-band bandwidth of 81.4% relative to the output sample rate, supporting a 200-MHz bandwidth with a 245.76-MSPS complex output rate.

Table 7-1. ADS58J64 Operating Modes

OPERATING MODE	DESCRIPTION	1ST STAGE DECIMATION	DIGITAL MIXER	2ND STAGE DECIMATION	BANDWIDTH AT 491.52 MSPS	BANDWIDTH AT 368.64 MSPS	OUTPUT MIXER	OUTPUT FORMAT	MAX OUTPUT RATE
0	Decimation	2	$\pm f_s / 4$	2	200 MHz	150 MHz	—	Complex	250 MSPS
1		2	16-bit NCO	2	200 MHz	150 MHz	—	Complex	250 MSPS
2		2	—	2	100 MHz (LP, LP or HP, HP), 75 MHz (HP, LP or LP, HP)	75 MHz, 56.25 MHz	—	Real	250 MSPS
3		2	16-bit NCO	Bypass	200 MHz	150 MHz	$f_{OUT} / 4$	Real	500 MSPS
4		2	16-bit NCO	2	100 MHz	75 MHz	$f_{OUT} / 4$	Real	250 MSPS
5		Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
6		2	16-bit NCO	4	100 MHz	75 MHz	—	Complex	125 MSPS
7		2	16-bit NCO	2	100 MHz	75 MHz	$f_{OUT} / 4$	Real with zero insertion	500 MSPS
8	Burst mode	—	—	—	223 MHz	167 MHz	—	Real	500 MSPS

7.4.1.1 Numerically Controlled Oscillators (NCOs) and Mixers

The ADS58J64 is equipped with a complex numerically-controlled oscillator. The oscillator generates a complex exponential sequence: $x[n] = e^{j\omega n}$. The frequency (ω) is specified by the 16-bit register setting. The complex exponential sequence is multiplied by the real input from the ADC to mix the desired carrier down to 0 Hz.

The NCO frequency setting is set by the 16-bit register value, NCO_FREQ[n]:

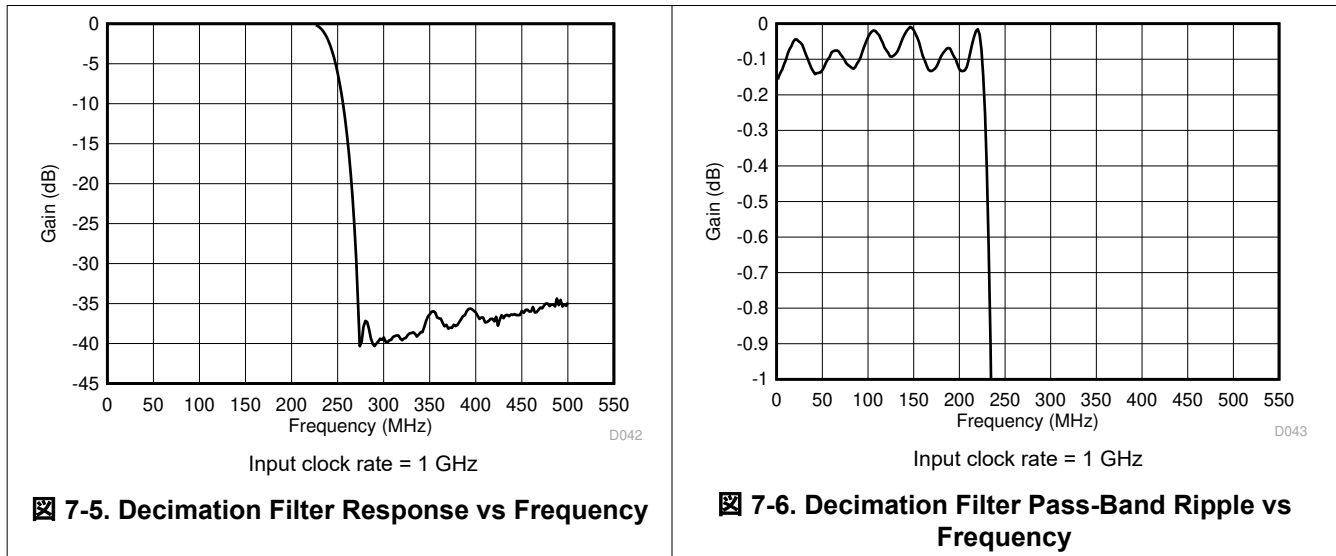

$$f_{\text{NCO}} = \frac{\text{NCO Frequency [n]} \times f_{\text{S}}}{2^{16}} \quad (1)$$

7.4.1.2 Decimation Filter

The ADS58J64 has two decimation filters (decimate-by-2) in the data path. The first stage of the decimation filter is non-programmable and is used in all functional modes. The second stage of decimation, available in DDC mode 2 and 6, can be used to obtain noise and linearity improvement for low bandwidth applications.

7.4.1.2.1 Stage-1 Filter

The first stage filter is used for decimation of the 2x interleaved data from f_{CLK} to $f_{\text{CLK}} / 2$. The frequency response and pass-band ripple of the first stage decimation filter are shown in [Figure 7-5](#) and [Figure 7-6](#), respectively.

7.4.1.2.2 Stage-2 Filter

The second stage filter is used for decimating the data from a sample rate of $f_{CLK} / 2$ to $f_{CLK} / 4$. The frequency response and pass-band ripple of the second stage filter are shown in [Figure 7-7](#) and [Figure 7-8](#), respectively.

7.4.1.3 Mode 0: Decimate-by-4 With IQ Outputs and $f_s / 4$ Mixer

In mode 0, the DDC block includes a fixed frequency $\pm f_s / 4$ complex digital mixer preceding the second stage decimation filters. The IQ passband is approximately ± 100 MHz centered at $f_s / 8$ or $3f_s / 8$, as shown in [Figure 7-9](#).

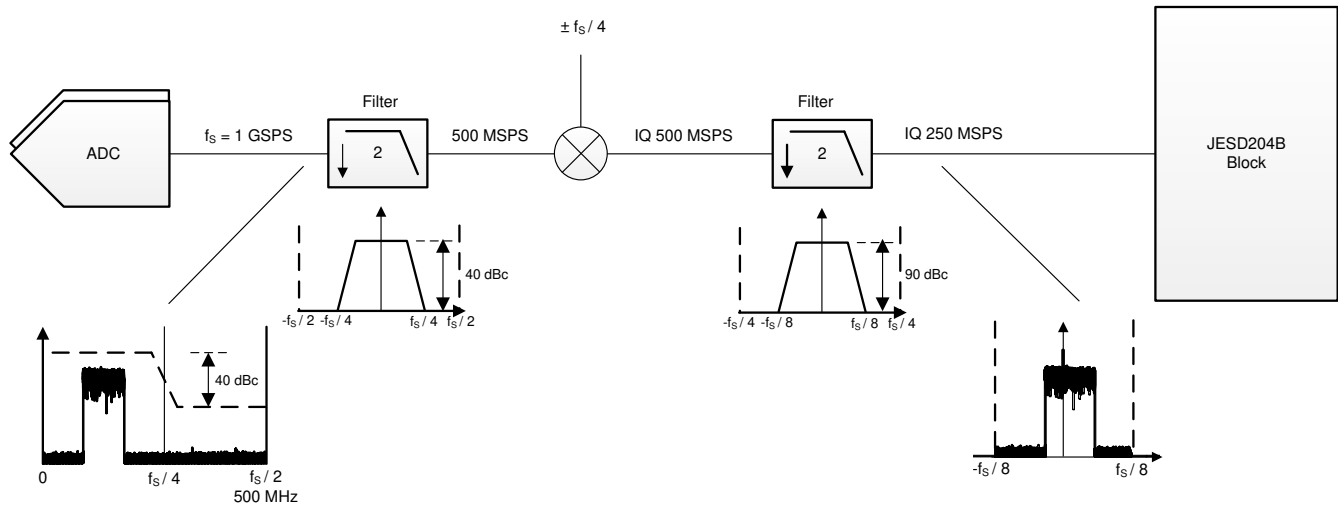

Figure 7-9. Operating Mode 0

7.4.1.4 Mode 1: Decimate-by-4 With IQ Outputs and 16-Bit NCO

In mode 1, the DDC block includes a 16-bit frequency resolution complex digital mixer preceding the second stage decimation filters, as shown in [Figure 7-10](#).

Figure 7-10. Operating Mode 1

7.4.1.5 Mode 2: Decimate-by-4 With Real Output

In mode 2, the DDC block cascades two decimate-by-2 filters. Each filter can be configured as low pass (LP) or high pass (HP) to allow down conversion of different frequency ranges, as shown in [Table 7-2](#). The LP, HP and HP, LP output spectra are inverted as shown in [Figure 7-11](#).

Figure 7-11. Operating in Mode 2

Table 7-2. ADS58J64 Operating Mode 2 Down-Converted Frequency Ranges

1ST STAGE FILTER	2ND STAGE FILTER	FREQUENCY RANGE WITH CLOCK RATE OF 983.04 MHz	BANDWIDTH WITH CLOCK RATE OF 983.04 MHz	FREQUENCY RANGE WITH CLOCK RATE OF 737.28 MHz	BANDWIDTH WITH CLOCK RATE OF 737.28 MHz
LP	LP	0 MHz–100 MHz	100 MHz	0 MHz–75 MHz	75 MHz
LP	HP	150 MHz–223 MHz	73 MHz	112.5 MHz–167.25 MHz	54.75 MHz
HP	LP	268.52 MHz–341.52 MHz	73 MHz	201.39 MHz–256.14 MHz	54.75 MHz
HP	HP	391.52 MHz–491.52 MHz	100 MHz	293.64 MHz–368.64 MHz	75 MHz

7.4.1.6 Mode 3: Decimate-by-2 Real Output With Frequency Shift

In mode 3, the DDC block includes a 16-bit complex NCO digital mixer followed by a $f_s / 4$ mixer with a real output to center the band at $f_s / 4$. The NCO must be set to a value different from $\pm f_s / 4$, or else the samples are zeroed as shown in [7-12](#).

7-12. Operating Mode 3

7.4.1.7 Mode 4: Decimate-by-4 With Real Output

In mode 4, the DDC block includes a 16-bit complex NCO digital mixer preceding the second stage decimation filter. The signal is then mixed with $f_{OUT} / 4$ to generate a real output, as shown in [7-13](#). The bandwidth available in this mode is 100 MHz.

7-13. Operating Mode 4

7.4.1.8 Mode 6: Decimate-by-4 With IQ Outputs for up to 110 MHz of IQ Bandwidth

In mode 6, the DDC block includes a 16-bit complex NCO digital mixer preceding a second stage with a decimate-by-4 complex, generating a complex output at $f_s / 8$ as shown in [Figure 7-14](#).

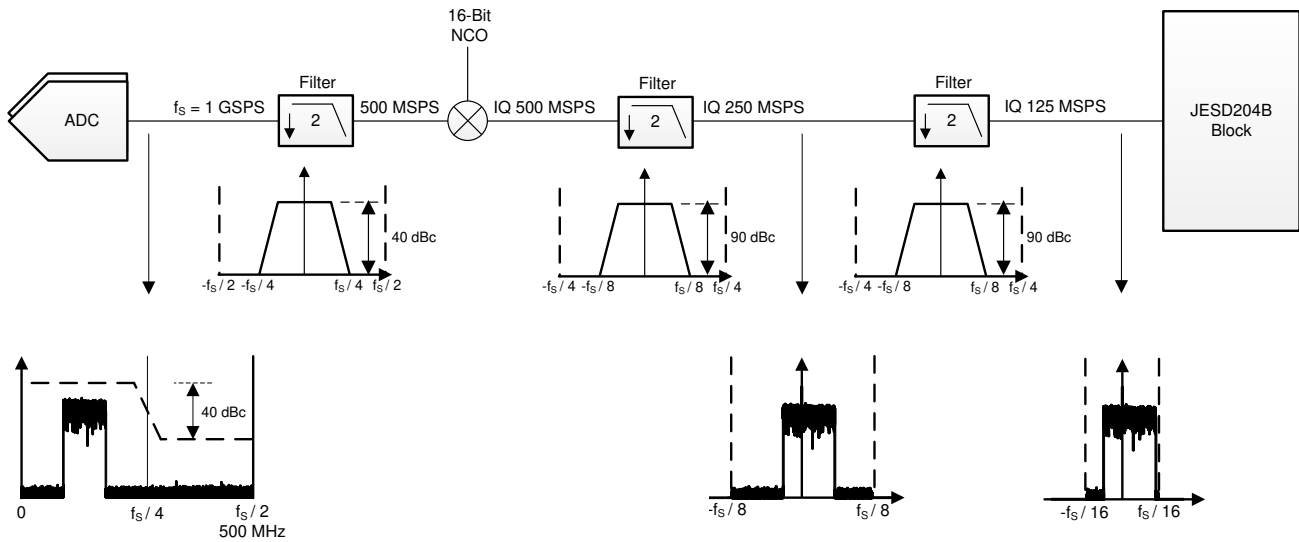

Figure 7-14. Operating Mode 6

7.4.1.9 Mode 7: Decimate-by-4 With Real Output and Zero Stuffing

In mode 7, the DDC block includes a 16-bit complex NCO digital mixer preceding the second stage decimation filter. The signal is then mixed with $f_{OUT} / 4$ to generate a real output that is then doubled in sample rate by zero stuffing every other sample, as shown in [Figure 7-15](#). The bandwidth available in this mode is 100 MHz.

Figure 7-15. Operating Mode 7

7.4.1.10 Mode 8: Burst Mode

In burst mode, the decimate-by-2 data are output alternating between low resolution (L, 9-bit) and high resolution (H, 14-bit) output. The burst mode can be configured via SPI register writes independently for channels A, B and channels C, D. The high-resolution output is 14 bits and the number of high- and low-resolution samples is set with two user-programmable counters: one for high resolution (HC) and one for low resolution (LC). There is one counter pair (HC, LC) for channels A, B and one pair for channels C, D. The internal logic checks if the maximum duty cycle is exceeded and, if necessary, resets the counters to default values. Each output cycle starts with a low resolution and the counter values can be reconfigured for the next cycle prior to the start of the next cycle. The number of high-resolution samples is equal to two times the high-resolution count (HC). Similarly, the number of low-resolution samples is equal to two times the low-resolution count (LC).

An example of burst mode with mode 8 is shown in [Figure 7-16](#).

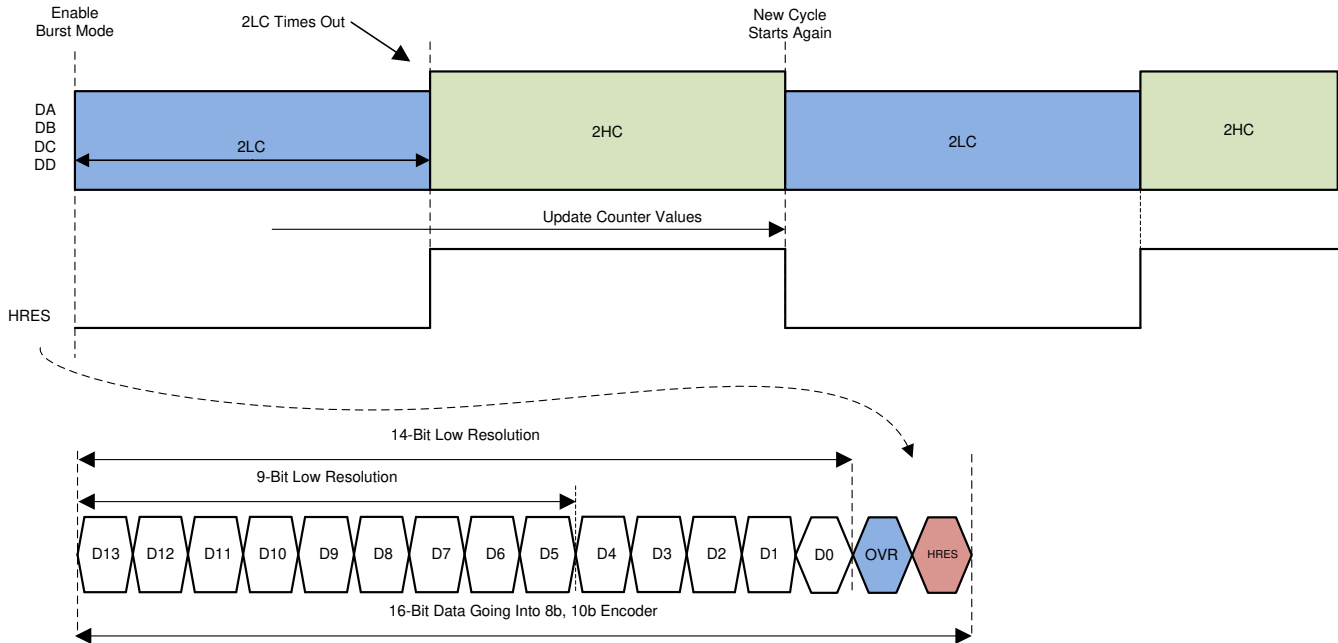

Figure 7-16. Burst Mode

The counter values for high and low resolution can be programmed to:

High-resolution counter (HC): 1 to 2^{25}

Low-resolution counter (LC): 1 to 2^{28}

The output duty cycle limit is shown in [Table 7-3](#).

Table 7-3. Output Duty Cycle Limit

HIGH-RESOLUTION OUTPUT	LOW-RESOLUTION OUTPUT	MAXIMUM-ALLOWED DUTY CYCLE (High:Low Resolution Output)	DEFAULT VALUE (HC)	DEFAULT VALUE (LC)
14 bits	9 bits	1:3	1	3

7.4.1.11 Trigger Input

Burst mode can be operated in auto trigger or manual trigger mode. In manual trigger mode, the TRIGGER input (TRIGAB, TRIGCD) is used to release the high-resolution data (HC) burst after the low-resolution data counter (LC) times out. In auto trigger mode, the high-resolution data are released immediately after completion of the last low-resolution sample.

Using SPI control the ADS58J64 can be configured to use TRIGAB or TRIGCD as the manual trigger input.

7.4.1.12 Manual Trigger Mode

Burst mode can be operated in auto trigger or manual trigger mode. In manual trigger mode, the TRIGGER input (TRIGAB, TRIGCD) is used to release the high-resolution data (HC) burst after the low-resolution data counter (LC) times out. In auto trigger mode, the high-resolution data are released immediately after completion of the last low-resolution sample. Using SPI control, the ADS58J64 can be configured to use TRIGAB or TRIGCD as the manual trigger input.

An example of burst mode with a manual trigger is shown in [Figure 7-17](#).

Figure 7-17. Timing Diagram for Manual Trigger Mode

7.4.1.13 Auto Trigger Mode

When auto trigger mode is enabled, the ADS58J64 starts transmission of low-resolution data. As soon as the low-resolution samples counter (LC) is finished, the ADS58J64 immediately begins transmitting the high-resolution output (H). The HRES flag can also be embedded in the JESD204B output data stream. The counter values can be updated until a new burst mode cycle starts with transmission of low-resolution samples. Any input on the trigger input pins is ignored.

An example of burst mode with an automatic trigger is shown in [Figure 7-18](#).

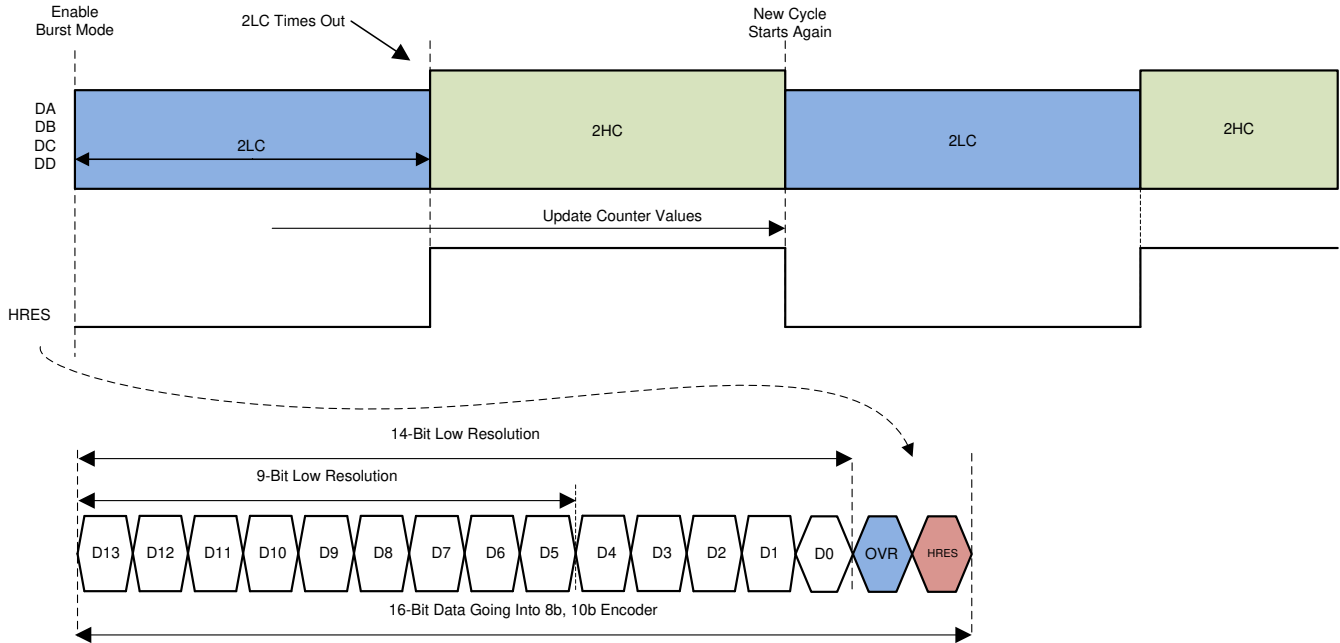

Figure 7-18. Timing Diagram for Auto Trigger Mode

7.4.1.14 Overrange Indication

The ADS58J64 provides a fast overrange indication that can be presented in the digital output data stream via SPI configuration. When the FOVR indication is embedded in the output data stream, this indication replaces the LSB (D0) of the 16 bits going to the 8b, 10b encode, as shown in [Figure 7-19](#).

Figure 7-19. Timing Diagram for FOVR

The fast overrange feature of the ADS58J64 is configured using an upper (FOVRHi) and a lower (FOVRLo) 8-bit threshold that are compared against the partial ADC output of the initial pipeline stages. [Figure 7-20](#) shows the FOVR high and FOVR low thresholds.

The two thresholds are configured via the SPI register where a setting of 136 maps to the maximum ADC code for a high FOVR, and a setting of 8 maps to the minimum ADC code for a low FOVR.

Figure 7-20. FOVR High and FOVR Low Thresholds

The FOVR threshold from a full-scale input based on the ADC code can be calculated by [Equation 2](#):

$$\text{FOVR (dBFS)} = 20 \log \left| \frac{\text{FOVR High or FOVR Low} - 72}{64} \right| \quad (2)$$

Therefore, a threshold of -0.5 dBFS from full-scale can be set with:

- FOVR high = 132 (27h, 84h)
- FOVR low = 12 (28h, 0Ch)

7.5 Programming

7.5.1 JESD204B Interface

The ADS58J64 supports device subclass 1 with a maximum output data rate of 10 Gbps for each serial transmitter.

An external SYSREF signal is used to align all internal clock phases and the local multi-frame clock to a specific sampling clock edge, as shown in [Figure 7-21](#). A common SYSREF signal allows synchronization of multiple devices in a system and minimizes timing and alignment uncertainty. The ADS58J64 supports single (for all four JESD links) or dual (for channel A, B and C, D) SYNCb inputs and can be configured via SPI.

Figure 7-21. JESD204B Transmitter Block

Depending on the ADC sampling rate, the JESD204B output interface can be operated with one lane per channel. The JESD204B setup and configuration of the frame assembly parameters is handled via the SPI interface.

The JESD204B transmitter block consists of the transport layer, the data scrambler, and the link layer, as shown in [Figure 7-22](#). The transport layer maps the ADC output data into the selected JESD204B frame data format and manages if the ADC output data or test patterns are being transmitted. The link layer performs the 8b, 10b data encoding as well as the synchronization and initial lane alignment using the SYNC input signal. Optionally, data from the transport layer can be scrambled.

Figure 7-22. JESD Interface Block Diagram

7.5.2 JESD204B Initial Lane Alignment (ILA)

The initial lane alignment process is started by the receiving device by deasserting the SYNCb signal. When a logic low is detected on the SYNC input pins, the ADS58J64 starts transmitting comma (K28.5) characters to establish code group synchronization, as shown in [Figure 7-23](#).

When synchronization is complete, the receiving device reasserts the SYNCb signal and the ADS58J64 starts the initial lane alignment sequence with the next local multi-frame clock boundary. The ADS58J64 transmits four multi-frames, each containing K frames (K is SPI programmable). Each of the multi-frames contains the frame start and end symbols and the second multi-frame also contains the JESD204 link configuration data.

Figure 7-23. ILA Sequence

7.5.3 JESD204B Frame Assembly

The JESD204B standard defines the following parameters:

- L is the number of lanes per link
- M is the number of converters per device
- F is the number of octets per frame clock period
- S is the number of samples per frame

表 7-4 lists the available JESD204B formats and valid ranges for the ADS58J64. The ranges are limited by the SerDes line rate and the maximum ADC sample frequency.

表 7-4. Available JESD204B Formats and Valid Ranges for the ADS58J64

7.5.4 JESD Output Switch

The ADS58J64 provides a digital cross-point switch in the JESD204B block that allows internal routing of any output of the two ADCs within one channel pair to any of the two JESD204B serial transmitters in order to ease layout constraints, as shown in [Figure 7-24](#). The cross-point switch routing is configured via SPI (address 41h in the SERDES_XX digital page).

Figure 7-24. Switching the Output Lanes

7.5.4.1 SerDes Transmitter Interface

Each of the 10-Gbps SerDes transmitter outputs require ac-coupling between the transmitter and receiver, as shown in [Figure 7-25](#). Terminate the differential pair with $100\ \Omega$ as close to the receiving device as possible to avoid unwanted reflections and signal degradation.

Figure 7-25. SerDes Transmitter Connection to Receiver

7.5.4.2 SYNCb Interface

The ADS58J64 supports single (where either the SYNCb input controls all four JESD204B links) or dual (where one SYNCb input controls two JESD204B lanes: DA, DB and DC, DD) SYNCb control. When using the single SYNCb control, connect the unused input to a differential logic low (SYNCbxxP = 0 V, SYNCbxxM = DVDD).

7.5.4.3 Eye Diagram

☒ 7-26 to ☒ 7-29 show the serial output eye diagrams of the ADS58J64 at 7.5 Gbps and 10 Gbps with default and increased output voltage swing against the JESD204B mask.

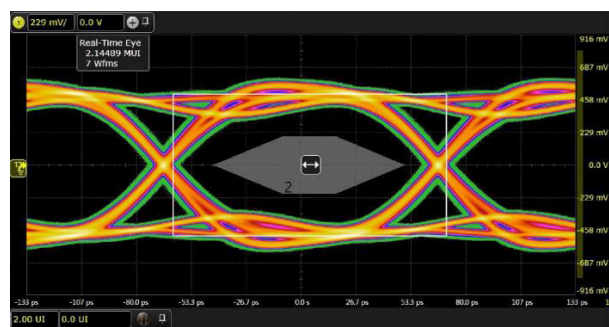

☒ 7-26. Eye at 10-Gbps Bit Rate with Default Output Swing

☒ 7-27. Eye at 7.5-Gbps Bit Rate with Default Output Swing

☒ 7-28. Eye at 10-Gbps Bit Rate with Increased Output Swing

☒ 7-29. Eye at 7.5-Gbps Bit Rate with Increased Output Swing

7.5.5 Device Configuration

The ADS58J64 can be configured using a serial programming interface, as described in the [セクション 7.6](#) section. In addition, the device has one dedicated parallel pin (PDN) for controlling the power-down modes. The ADS58J64 supports a 24-bit (16-bit address, 8-bit data) SPI operation and uses paging to access all register bits.

7.5.5.1 Details of the Serial Interface

The ADC has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), SDIN (serial data input data), and SDOU (serial data output) pins. Serially shifting bits into the device is enabled when SEN is low. SDIN serial data are latched at every SCLK rising edge when SEN is active (low). Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The first 16 bits form the register address and the remaining eight bits are the register data. The interface can work with SCLK frequencies from 10 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

7.5.5.1.1 Register Initialization

After power-up, the internal registers must be initialized to the default values. This initialization can be accomplished in one hardware reset by applying a high pulse on the RESET pin.

7.5.5.2 Serial Register Write

The internal registers of the ADS58J64 can be programmed (as shown in [Figure 7-30](#)) by:

1. Driving the SEN pin low
2. Setting the R/W bit = 0
3. Initiating a serial interface cycle specifying the address of the register (A[14:0]) whose content must be written
4. Writing the 8-bit data that is latched in on the SCLK rising edge

The ADS58J64 has several different register pages (page selection in address 11h, 12h). Specify the register page before writing to the desired address. The register page only must be set one time for continuous writes to the same page.

During the write operation, the SDOUT pin is in a high-impedance mode and must float.

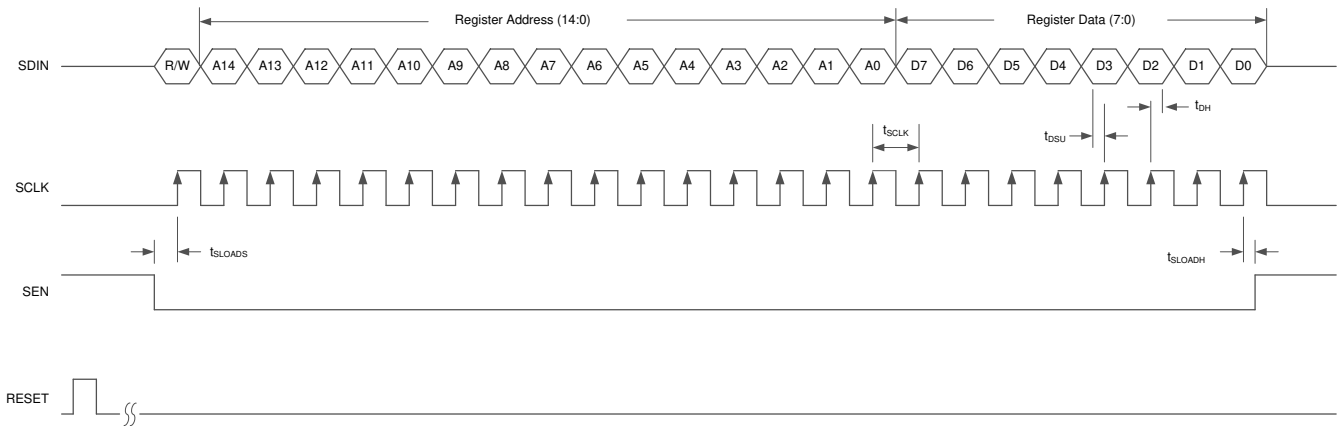

Figure 7-30. Serial Interface Write Timing Diagram

7.5.5.3 Serial Read

A typical 4-wire serial register readout is shown in [Figure 7-31](#). In the default 4-pin configuration, the SDIN pin is the data output from the ADS58J64 during the data transfer cycle when SDOUT is in a high-impedance state. The internal registers of the ADS58J64 can be read out by:

1. Driving the SEN pin low
2. Setting the R/W bit to 1 to enable read back
3. Specifying the address of the register (A[14:0]) whose content must be read back
4. The device outputs the contents (D[7:0]) of the selected register on the SDOUT pin (pin 51)
5. The external controller can latch the contents at the SCLK rising edge

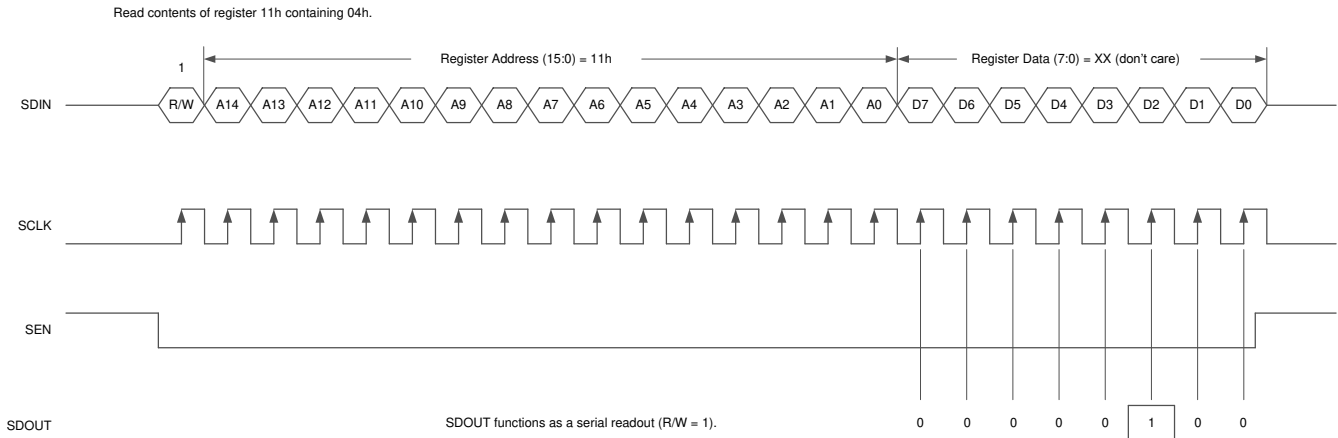

Figure 7-31. Serial Interface 4-Wire Read Timing Diagram

7.6 Register Maps

7.6.1 Register Map

The ADS58J64 registers are organized on different pages depending on their internal functions. The pages are accessed by selecting the page in the master pages 11h–13h. The page selection must only be written one time for a continuous update of registers for that page.

There are six different SPI banks (shown in [Figure 7-32](#)) that group together different functions:

- GLOBAL: contains controls for accessing other SPI banks
- DIGTOP: top-level digital functions
- ANALOG: registers controlling power-down and analog functions
- SERDES_XX: registers controlling JESD204B functions
- CHX: registers controlling channel-specific functions, including DDC
- ADCXX: register page for one of the eight interleaved ADCs

LEGEND: R/W = Read/Write; -n = value after reset

表 7-35. Register 20h Field Descriptions

Bit	Field	Type	Reset	Description
7	CTRL_K	R/W	0h	This bit is the enable bit for programming the number of frames per multi-frame. 0 : Default: 5 frames per multi-frame 1 : Frames per multi-frame can be programmed using register 26h
6	CTRL_SER_MODE	R/W	0h	This bit allows the SerDes_MODE setting in register 21h (bits 1-0) to be changed. 0 : Disabled 1 : Enables SerDes_MODE setting
5	0	R/W	0h	Must read or write 0
4	TRANS_TEST_EN	R/W	0h	This bit generates the long transport layer test pattern mode, as per section 5.1.6.3 of the JESD204B specification. 0 : Test mode is disabled 1 : Test mode is enabled
3	0	R/W	0h	Must read or write 0
2	LANE_ALIGN	R/W	0h	This bit inserts the lane alignment character (K28.3) for the receiver to align to the lane boundary, as per section 5.3.3.5 of the JESD204B specification. 0 : Normal operation 1 : Inserts lane alignment characters
1	FRAME_ALIGN	R/W	0h	This bit inserts the lane alignment character (K28.7) for the receiver to align to the lane boundary, as per section 5.3.3.5 of the JESD204B specification. 0 : Normal operation 1 : Inserts frame alignment characters
0	TX_ILA_DIS	R/W	0h	This bit disables sending the initial link alignment (ILA) sequence when SYNC is deasserted. 0 = Normal operation 1 = Disables ILA

7.6.1.1.4.2 Register 21h (address = 21h) [reset = 0h], SERDES_XX Page

图 7-57. Register 21h

LEGEND: R/W = Read/Write; -n = value after reset

表 7-36. Register 21h Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC_REQ	R/W	0h	This bit controls the SYNC register (bit 6 must be enabled). 0 : Normal operation 1 : ADC output data are replaced with K28.5 characters
6	OPT_SYNC_REQ	R/W	0h	This bit enables SYNC operation. 0 : Normal operation 1 : Enables SYNC from the SYNC_REQ register bit
5	SYNCB_SEL_AB_CD	R/W	0h	This bit selects which SYNCb input controls the JESD interface. 0 : Use the SYNCbAB, SYNCbCD pins 1 : When set in the SerDes AB SPI, SYNCbCD is used for the SerDes AB and CD. When set in the SerDes CD SPI, SYNCbAB is used for the SerDes AB and CD
4-2	0	R/W	0h	Must read or write 0
1-0	SerDes_MODE	R/W	0h	These bits set the JESD output parameters. The CTRL_SER_MODE bit (register 20h, bit 6) must also be set to control these bits. These bits are auto configured for modes 0, 1, 3, and 7, but must be configured for modes 2, 4, and 6.

7.6.1.1.4.3 Register 22h (address = 22h) [reset = 0h], SERDES_XX Page

表 7-37. Register 22h Field Descriptions

Bit	Field	Type	Reset	Description
7-5	LINK_LAYER_TESTMODE_SEL	R/W	0h	These bits generate a pattern as per section 5.3.3.8.2 of the JESD204B document. 0 : Normal ADC data 1 : D21.5 (high-frequency jitter pattern) 2 : K28.5 (mixed-frequency jitter pattern) 3 : Repeat the initial lane alignment (generates a K28.5 character and continuously repeats lane alignment sequences) 4 : 12-octet RPAT jitter pattern 6 : PRBS pattern (PRBS7, 15, 23, 31). Use PRBS_MODE (register 36h, bits 7-6) to select the PRBS pattern.
4	RPAT_SET_DISP	R/W	0h	This bit changes the running disparity in the modified RPAT pattern test mode (only when the link layer test mode = 100). 0 : Normal operation 1 : Changes disparity
3	LMFC_MASK_RESET	R/W	0h	0 : Default 1 : Resets the LMFC mask
2-0	0	R/W	0h	Must read or write 0

7.6.1.1.4.4 Register 23h (address = 23h) [reset = 0h], SERDES_XX Page

8.1.2 Hardware Reset

Timing information for the hardware reset is shown in [Figure 8-1](#).

Figure 8-1. Hardware Reset Timing Diagram

Table 8-3. Timing Requirements for [Figure 8-1](#)

		MIN	TYP	MAX	UNIT
t_1	Power-on delay from power-up to active high RESET pulse	1			ms
t_2	Reset pulse duration: active high RESET pulse duration	10			ns
t_3	Register write delay from RESET disable to SEN active	100			μ s

8.1.3 Frequency Planning

The ADS58J64 uses an architecture where the ADCs are 2x interleaved followed by a digital decimation by 2. The 2x interleaved and decimation architecture comes with a unique advantage of improved linearity resulting from frequency planning. Frequency planning refers to choosing the clock frequency and signal band appropriately such that the harmonic distortion components, resulting from the analog front-end (LNA, PGA), can be made to fall outside the decimation filter pass band. In absence of the 2x interleave and decimation architecture, these components alias back in band and limit the performance of the signal chain. For example, for $f_{CLK} = 983.04$ MHz and $f_{IN} = 184.32$ MHz:

Second-order harmonic distortion (HD2) = $2 \times 184.32 = 368.64$ MHz

Pass band of the 2x decimation filter = 0 MHz to 245.76 MHz (0 to $f_{CLK} / 4$)

The second-order harmonic performance improves by the stop-band attenuation of the filter (approximately 40 dBc) because the second-order harmonic frequency is outside the pass band of the decimation filter.

Figure 8-2 shows the harmonic components (HD2–HD5) that fall in the decimation pass band for the input clock rate (f_{CLK}) of the 983.04-MHz and 100-MHz signal band around the center frequency of 184.32 MHz.

$f_{CLK} = 983.04$ MHz, signal band = 134.32 MHz to 234.32 MHz

Figure 8-2. In-Band Harmonics for a Frequency Planned System

As shown in Figure 8-2, both HD2 and HD3 are completely out of band. HD4 and HD5 fall in the decimation pass band for some frequencies of the input signal band.

Through proper frequency planning, the specifications of the ADC antialias filter can be relaxed.

8.1.4 SNR and Clock Jitter

The signal-to-noise ratio of the ADC is limited by three different factors (as shown in Equation 3): the quantization noise is typically not noticeable in pipeline converters and is 84 dB for a 14-bit ADC. The thermal noise limits the SNR at low input frequencies and the clock jitter sets the SNR for higher input frequencies.

$$SNR_{ADC} [dBc] = -20 \log \sqrt{\left(10^{\frac{SNR_{Quantization\ Noise}}{20}}\right)^2 + \left(10^{\frac{SNR_{Thermal\ Noise}}{20}}\right)^2 + \left(10^{\frac{SNR_{Jitter}}{20}}\right)^2} \quad (3)$$

The SNR limitation resulting from sample clock jitter can be calculated by Equation 4:

$$SNR_{Jitter} [dBc] = -20 \log(2\pi \times f_{in} \times T_{Jitter}) \quad (4)$$

The total clock jitter (T_{Jitter}) has two components: the internal aperture jitter (100 fs for the ADS58J64) that is set by the noise of the clock input buffer and the external clock jitter. T_{Jitter} can be calculated by Equation 5:

$$T_{Jitter} = \sqrt{(T_{Jitter, Ext_Clock_Input})^2 + (T_{Aperture_ADC})^2} \quad (5)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input; a faster clock slew rate also improves the ADC aperture jitter.

The ADS58J64 has a thermal noise of approximately 70 dBFS and an internal aperture jitter of 100 fs.

8.1.5 ADC Test Pattern

The ADS58J64 provides several different options to output test patterns instead of the actual output data of the ADC in order to simplify debugging of the JESD204B digital interface link. The output data path is shown in [Figure 8-3](#).

Figure 8-3. ADC Test Pattern

8.1.5.1 ADC Section

The ADC test pattern replaces the actual output data of the ADC. These test patterns can be programmed using register 91h of the DIGTOP page. The supported test patterns are shown in [Table 8-4](#).

Table 8-4. ADC Test Pattern Settings

BIT	NAME	DEFAULT	DESCRIPTION
7-4	TESTPATTERNSELECT	0000	These bits select the test pattern on the output when the test pattern is enabled for a suitable channel. 0 : Default 1 : All zeros 2 : All ones 3 : Toggle pattern 4 : Ramp pattern 6 : Custom pattern 1 7 : Toggles between custom pattern 1 and custom pattern 2 8 : Deskew pattern (AAAAh)

8.1.5.2 Transport Layer Pattern

The transport layer maps the ADC output data into 8-bit octets and constructs the JESD204B frames using the LMFS parameters. Tail bits or 0s are added when needed. Alternatively, the JESD204B long transport layer test pattern can be substituted by programming register 20h, as shown in [Table 8-5](#).

Table 8-5. Transport Layer Test Mode

BIT	NAME	DEFAULT	DESCRIPTION
4	TRANS_TEST_EN	0	This bit generates the long transport layer test pattern mode according to clause 5.1.6.3 of the JESD204B specification. 0 = Test mode disabled 1 = Test mode enabled

8.1.5.3 Link Layer Pattern

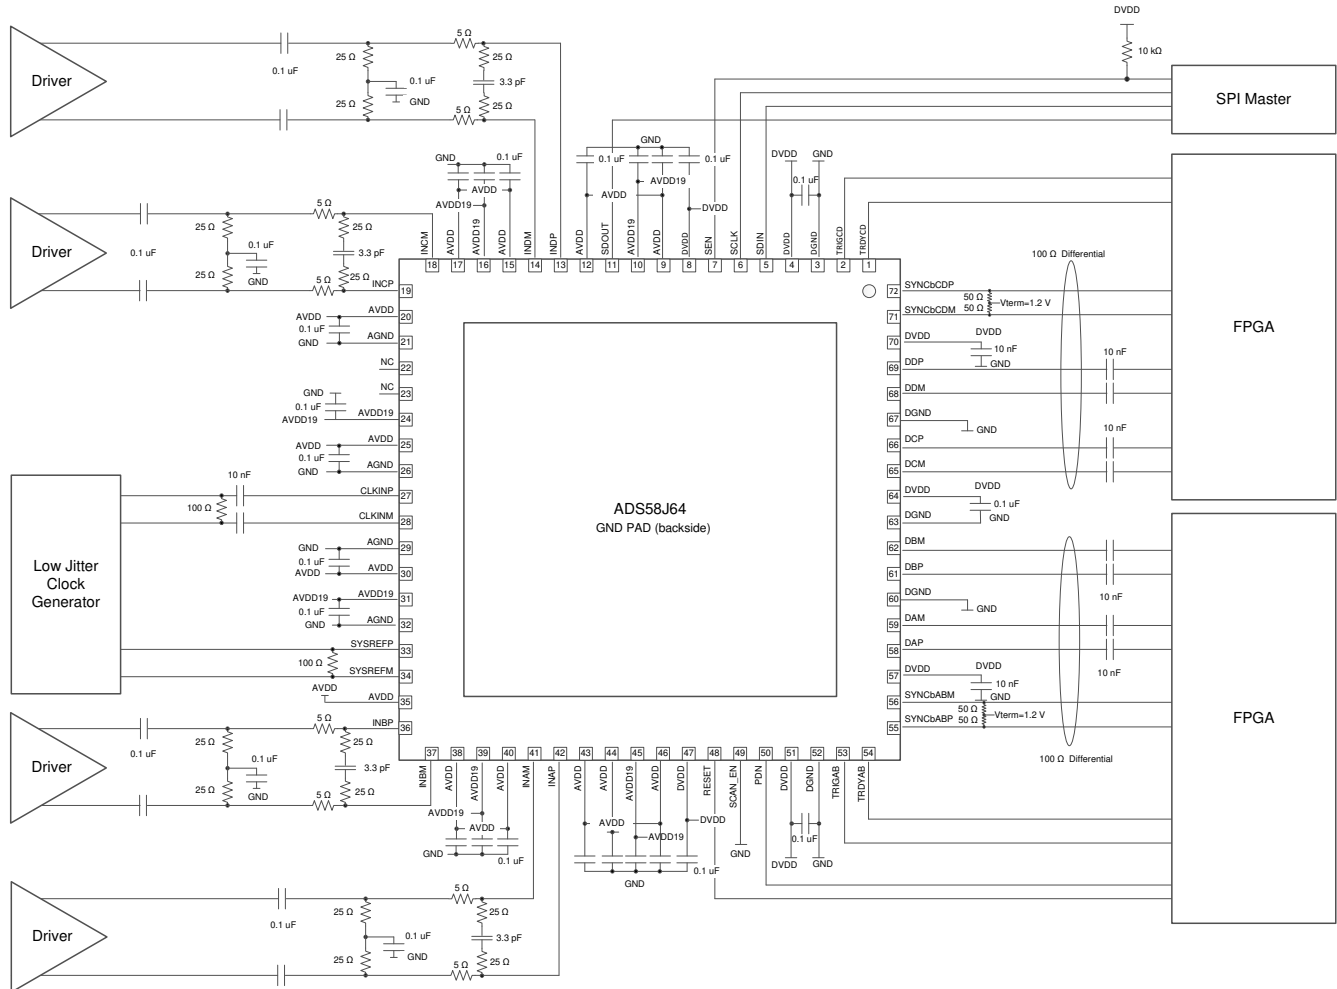

The link layer contains the scrambler and the 8b, 10b encoding of any data passed on from the transport layer. Additionally, the link layer also handles the initial lane alignment sequence that can be manually restarted. The link layer test patterns are intended for testing the quality of the link (jitter testing and so forth). The test patterns do not pass through the 8b, 10b encoder. These test patterns can be used by programming register 22h of the SERDES_XX page. [表 8-6](#) shows the supported programming options.

表 8-6. Link Layer Test Mode

BIT	NAME	DEFAULT	DESCRIPTION
7-5	LINK_LAYER_TESTMODE_SEL	000	<p>These bits generate a pattern according to clause 5.3.3.8.2 of the JESD204B document.</p> <ul style="list-style-type: none"> 0 : Normal ADC data 1 : D21.5 (high-frequency jitter pattern) 2 : K28.5 (mixed-frequency jitter pattern) 3 : Repeats initial lane alignment (generates a K28.5 character and continuously repeats lane alignment sequences) 4 : 12-octet RPAT jitter pattern 6 : PRBS pattern (PRBS7,15,23,31); use PRBS mode (register 36h) to select the PRBS pattern

8.2 Typical Application

The ADS58J64 is designed for wideband receiver applications demanding excellent dynamic range over a large input frequency range. A typical schematic for an ac-coupled dual receiver [dual field-programmable gate array (FPGA) with a dual SYNC] is shown in [Figure 8-4](#).

Copyright © 2017, Texas Instruments Incorporated

NOTE: GND = AGND and DGND are connected in the PCB layout.

Figure 8-4. Application Diagram for the ADS58J64

8.2.1 Design Requirements

By using the simple drive circuit of [Figure 8-4](#) (when the amplifier drives the ADC) or [Figure 7-1](#) (when transformers drive the ADC), uniform performance can be obtained over a wide frequency range. The buffers present at the analog inputs of the device help isolate the external drive source from the switching currents of the sampling circuit.

8.2.2 Detailed Design Procedure

For optimum performance, the analog inputs must be driven differentially. This architecture improves the common-mode noise immunity and even-order harmonic rejection. A small resistor (5 Ω to 10 Ω) in series with each input pin is recommended to damp out ringing caused by package parasitics, as shown in [Figure 8-4](#).

8.2.3 Application Curves

 8-5 and  8-6 show the typical performance at 190 MHz and 230 MHz, respectively.

9 Power Supply Recommendations

The device requires a 1.15-V nominal supply for DVDD, a 1.15-V nominal supply for AVDD, and a 1.9-V nominal supply for AVDD19. AVDD and DVDD are recommended to be powered up the before AVDD19 supply for reliable loading of factory trims.

10 Layout

10.1 Layout Guidelines

The device evaluation module (EVM) layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in [Figure 10-1](#). A complete layout of the EVM is available at the [ADS58J64 EVM folder](#). Some important points to remember during board layout are:

- Analog inputs are located on opposite sides of the device pinout to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pinout in opposite directions, as shown in the reference layout of [Figure 10-1](#) as much as possible.
- In the device pinout, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of [Figure 10-1](#) as much as possible.
- Keep digital outputs away from the analog inputs. When these digital outputs exit the pinout, the digital output traces must not be kept parallel to the analog input traces because this configuration can result in coupling from the digital outputs to the analog inputs and degrade performance. All digital output traces to the receiver [such as an FPGA or an application-specific integrated circuit (ASIC)] must be matched in length to avoid skew among outputs.
- At each power-supply pin (AVDD, DVDD, or AVDD19), keep a 0.1- μ F decoupling capacitor close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- μ F, 1- μ F, and 0.1- μ F capacitors can be kept close to the supply source.

10.2 Layout Example

11 Device and Documentation Support

11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.2 サポート・リソース

[TI E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

11.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RRH0072A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要なお知らせと免責事項

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
