

# BQ25622E I<sup>2</sup>C 制御、1セル、3A、最大 18V 入力、降圧バッテリーチャージャ、NVDC パワーパス管理付き

## 1 特長

- シングルセルバッテリー向けの高効率、1.5MHz、同期スイッチングモード降圧チャージャ
  - 5V 入力から 90% を上回る効率で 25mA の出力電流を供給
  - 10mA~620mA、10mA ステップの充電終了
  - フレキシブルな JEITA プロファイルにより温度範囲全体にわたって安全に充電
- BATFET 制御によりシャットダウン、出荷モード、完全システムリセットをサポート
  - バッテリーのみモードで 1.5μA の静止電流
  - 出荷モードで 0.15μA のバッテリーリーク電流
  - シャットダウンで 0.1μA のバッテリーリーク電流
- 幅広い入力電源をサポート
  - の広い入力動作電圧範囲、26V の絶対最大入力電圧
  - 入力電圧レギュレーション (VINDPM) と入力電流レギュレーション (IINDPM) によりソース電力を最大化
  - バッテリー電圧を自動的に追従する VINDPM スレッシュホールド
- 15mΩ の BATFET による高効率のバッテリー動作
- Narrow VDC (NVDC) パワーパス管理
  - 消耗したバッテリーまたはバッテリー未接続でもシステムを即時オン
  - アダプタが全負荷になったときのバッテリー補完
- フレキシブルな自律または I<sup>2</sup>C 制御モード
- 電圧、電流、温度を監視するための 12 ビット ADC を内蔵
- 高い精度
  - ±0.5% の充電電圧レギュレーション
  - ±5% の充電電流レギュレーション
  - ±5% の入力電流レギュレーション
- 安全
  - サーマルレギュレーションおよびサーマルシャットダウン
  - 入力、システム、バッテリーの過電圧保護
  - バッテリー、コンバータの過電流保護
  - 充電安全タイマ
- 安全関連認証
  - IEC 62638-1 CB 認証

## 2 アプリケーション

- タブレット
- ゲームおよびコンピュータ用アクセサリ
- IP カメラ、EPOS

- 携帯医療機器

## 3 概要

BQ25622E は、シングルセルのリチウムイオンおよびリチウムポリマーバッテリー用の、高度に統合された 3A スイッチモードバッテリー充電管理およびシステムパワーパス管理デバイスです。このソリューションは、内蔵電流検出、ループ補償、入力逆電流ブロック FET (RBFET、Q1)、ハイサイドスイッチング FET (HSFET、Q2)、ローサイドスイッチング FET (LSFET、Q3)、およびシステムとバッテリーの間にあるバッテリー FET (BATFET、Q4) を高度に統合しています。システム電圧が設定可能な最小値を下回らないように、本デバイスは精密な VDC パワーパス管理機能を使用して、システム電圧をバッテリー電圧よりわずかに高い値にレギュレートします。低インピーダンスのパワーパスはスイッチモード動作効率を最適化し、バッテリー充電時間を短縮し、放電フェーズ中のバッテリー寿命を延長します。また、非常に小さい 0.15μA の出荷モード電流はバッテリーの保存性を高めます。充電およびシステムの設定に I<sup>2</sup>C シリアルインターフェイスを使用できるため、BQ25622E は真に柔軟なソリューションとなります。

### 製品情報

部品番号	パッケージ <sup>(1)</sup>	本体サイズ (公称)
BQ25622E	RYK (WQFN 18)	2.50mm × 3.00mm

- (1) 供給されているすべてのパッケージについては、[セクション 14](#) を参照してください。

## 4 概要 (続き)

BQ25622E は、デフォルトの入力電流制限値を設定するための ILIM ピンと、サーミスタのバイアスを制御するための TS\_BIAS ピンを持っています。

パワーパス管理により、システムはバッテリー電圧より少し高くなるように、かつプログラム可能な最低システム電圧より低くならないようにレギュレートされます。この機能により、システムはバッテリーが完全に消耗したとき、または取り外したときでも、動作を継続できます。入力の電流または電圧が制限値に達すると、パワーパス管理機能が自動的に充電電流を低下させます。システム負荷が引き続き増大すると、バッテリーは放電を開始し、システムの電力要件が満たされるまで放電を続けます。この補助モードにより入力ソースの過負荷を防止します。

BQ25622E は、ホスト制御なしで、充電サイクルの開始から完了までを実行できます。バッテリー電圧を検知することで、本デバイスは 4 つの段階 (トリクル充電、予備充電、定電流 (CC) 充電、定電圧 (CV) 充電) でバッテリーを充電します。充電サイクルの終わりに、充電電流があらかじめ設定されたスレッシュホールドを下回り、かつバッテリー電圧が再充電スレッシュホールドを上回ると、チャージャは自動的に処理を終了します。終了は、TS ピンの全温度範囲でサポートされています。

BQ25622E は、バッテリーの負温度係数サーミスタ監視、充電安全タイマ、過電圧および過電流保護など、バッテリー充電とシステム運用のための多様な安全機能を備えています。接合部温度がプログラム可能なスレッシュホールド値を超えると、サーマルレギュレーションにより充電電流が低下します。STAT 出力は、充電状態と任意のフォルト状態を通知します。その他の安全機能として、充電モードでのバッテリー温度センシング、サーマルシャットダウン、入力 UVLO および過電圧保護も装備しています。INT 出力は、フォルトの発生とステータスの変化をホストに通知します。

BQ25622E は 18 ピン、2.5mm × 3.0mm の WQFN パッケージで供給されます。

## 5 Device Comparison

表 5-1. Device Comparison

FUNCTION	BQ25620	BQ25622	BQ25622E
Input Voltage Range	3.9V - 18V	3.9V - 18V	3.9V - 18V
Part Configuration	I2C	I2C	I2C
Programmable Charge Voltage	3.5 - 4.8V (10mV per step)	3.5 - 4.8V (10mV per step)	3.5 - 4.8V (10mV per step)
D+/D- USB Detection	Yes	No	No
ILIM Pin	No	Yes	Yes
TS Profile	JEITA	JEITA	JEITA
Quiescent Battery Current	1.5 $\mu$ A	1.5 $\mu$ A	1.5 $\mu$ A
OTG	Yes	Yes	No
OTG Current Limit	2.4A	2.4A	-
ADC	12-bit ADC	12-bit ADC	12-bit ADC
Package	2.5x3mm <sup>2</sup> QFN (18)	2.5x3mm <sup>2</sup> QFN (18)	2.5x3mm <sup>2</sup> QFN (18)

## 6 Pin Configuration and Functions

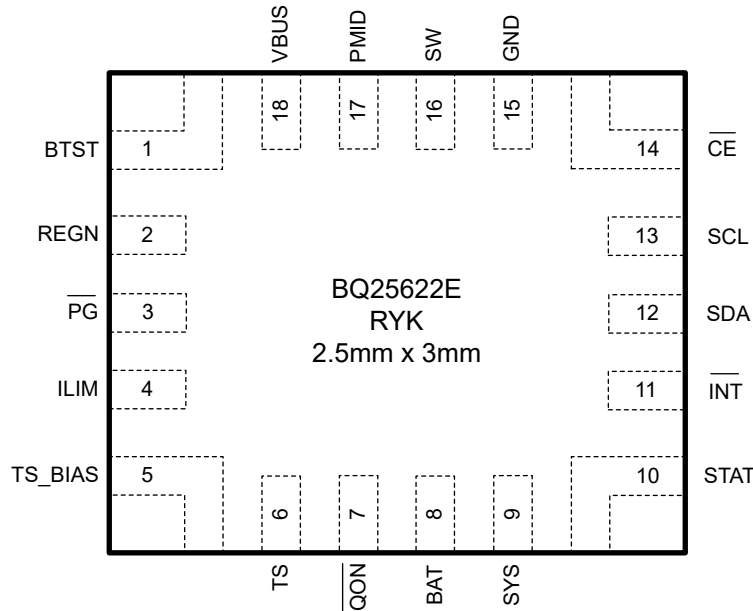

図 6-1. BQ25622E Pinout, 18-Pin WQFN Top View

表 6-1. Pin Functions

NAME	NO.	TYPE <sup>(1)</sup>	DESCRIPTION
BTST	1	P	<b>High Side Switching MOSFET Gate Driver Power Supply</b> – Connect a 10 V or higher rating, 47-nF ceramic capacitor between SW and BTST as the bootstrap capacitor for driving high side switching MOSFET (Q2).
REGN	2	P	<b>The Charger Internal Linear Regulator Output</b> – Internally, REGN is connected to the anode of the boost-strap diode. Connect a 10 V or higher rating, 4.7-μF ceramic capacitor from REGN to power ground. The capacitor should be placed close to the IC. The REGN LDO output is used for the internal MOSFETs gate driving voltage.
$\overline{\text{PG}}$	3	DO	<b>Open Drain Active Low Power Good Indicator</b> – Connect to the pull up rail via 10-kΩ resistor. LOW indicates an input source of $V_{\text{VBUS\_UVLO}} < \text{VBUS} < V_{\text{VBUS\_OVP}}$ . Failing poor source detection or triggering the sleep comparator ( $\text{VBUS} < \text{VBAT} + V_{\text{SLEEP}}$ ) also causes PG to transition HIGH.
ILIM	4	AIO	<b>Input Current Limit Setting Input Pin</b> – ILIM pin sets the input current limit as $I_{\text{INREG}} = K_{\text{ILIM}} / R_{\text{ILIM}}$ , where $R_{\text{ILIM}}$ is connected from ILIM pin to GND. The input current is limited to the lower of the two values set by ILIM pin and IINDPM register bits. The ILIM pin can also be used to monitor input current. The input current is proportional to the voltage on ILIM pin and can be calculated by $I_{\text{IN}} = (K_{\text{ILIM}} \times V_{\text{ILIM}}) / (R_{\text{ILIM}} \times 0.8)$ . The ILIM pin function is disabled when EN_EXTILIM bit is set to 0.
TS_BIAS	5	P	<b>Bias for the TS Resistor Voltage Divider</b> – Provides the bias voltage for the TS resistor voltage divider.
TS	6	AI	<b>Temperature Qualification Voltage Input</b> – Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from TS pin bias reference to TS, then to GND. Charge suspends when TS pin voltage is out of range. Recommend a 103AT-2 10-kΩ thermistor.
$\overline{\text{QON}}$	7	DI	<b>BATFET Enable or System Power Reset Control Input</b> – If the charger is in ship mode, a logic low on this pin with $t_{\text{SM\_EXIT}}$ duration forces the device to exit ship mode. If the charger is not in ship mode, a logic low on this pin with $t_{\text{QON\_RST}}$ initiates a full system power reset if either $V_{\text{VBUS}} < V_{\text{VBUS\_UVLO}}$ or $\text{BATFET\_CTRL\_WVBUS} = 1$ . QON has no effect during shutdown mode. The pin contains an internal pull-up to maintain default high logic.
BAT	8	P	<b>The Battery Charging Power Connection</b> – Connect to the positive terminal of the battery pack. The internal BATFET is connected between SYS and BAT.
SYS	9	P	<b>The Charger Output Voltage to System</b> –The Buck converter output connection point to the system. The internal BATFET is connected between SYS and BAT.

表 6-1. Pin Functions (続き)

NAME	NO.	TYPE <sup>(1)</sup>	DESCRIPTION
STAT	10	DO	<b>Open Drain Charge Status Output</b> – It indicates various charger operations. Connect to the pull up rail via 10-kΩ resistor. LOW indicates charging in progress. HIGH indicates charging completed or charging disabled. When any fault condition occurs, STAT pin blinks at 1Hz. Setting DIS_STAT = 1 disables the STAT pin function, causing the pin to be pulled HIGH. Leave floating if unused.
INT	11	DO	<b>Open Drain Interrupt Output.</b> – Connect to the pull up rail via 10-kΩ resistor. The INT pin sends an active low, 256-μs pulse to the host to report the charger device status and faults.
SDA	12	DIO	<b>I<sup>2</sup>C Interface Data</b> – Connect SDA to the logic rail through a 10-kΩ resistor.
SCL	13	DI	<b>I<sup>2</sup>C Interface Clock</b> – Connect SCL to the logic rail through a 10-kΩ resistor.
CE	14	DI	<b>Active Low Charge Enable Pin</b> – Battery charging is enabled when EN_CHG bit is 1 and CE pin is LOW. CE pin must be pulled HIGH or LOW, do not leave floating.
GND	15	P	<b>Ground Return</b>
SW	16	P	<b>Switching Node Connecting to Output Inductor</b> – Internally SW is connected to the source of the n-channel HSFET and the drain of the n-channel LSFET. Connect the 47-nF bootstrap capacitor from SW to BTST.
PMID	17	P	<b>HSFET Drain Connection</b> – Internally PMID is connected to the drain of the reverse blocking MOSFET (RBFET) and the drain of HSFET.
VBUS	18	P	<b>Charger Input Voltage</b> – The internal n-channel reverse block MOSFET (RBFET) is connected between VBUS and PMID with VBUS on source.

(1) AI = Analog input, AO = Analog Output, AIO = Analog input Output, DI = Digital input, DO = Digital Output, DIO = Digital input Output, P = Power

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage range (with respect to GND)	VBUS (converter not switching)	-2	26	V
	PMID (converter not switching)	-0.3	26	V
	BAT, SYS (converter not switching)	-0.3	6	V
	SW	-2 (50ns)	21	V
	BTST (when converter switching)	-0.3	27	V
	CE, STAT, SCL, SDA, INT, REGN, QON	-0.3	6	V
	ILIM, PG, TS, TS_BIAS	-0.3	6	V
Output Sink Current	INT, STAT, PG		6	mA
Differential Voltage	BTST-SW	-0.3	6	V
	PMID-VBUS	-0.3	6	V
	SYS-BAT	-0.3	6	V
T <sub>J</sub>	Junction temperature	-40	150	°C
T <sub>stg</sub>	Storage temperature	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>VBUS</sub>	Input voltage	3.9		18	V
V <sub>BAT</sub>	Battery voltage			4.8	V
I <sub>VBUS</sub>	Input current			3.2	A
I <sub>SW</sub>	Output current (SW)			3.5	A
I <sub>BAT</sub>	Fast charging current			3	A
	RMS discharge current (continuously)			6	A
	Peak discharge current (up to 50ms)			10	A
I <sub>REGN</sub>	Maximum REGN Current			20	mA
T <sub>A</sub>	Ambient temperature	-40		85	°C
T <sub>J</sub>	Junction temperature	-40		125	°C
L <sub>SW</sub>	Inductor for the switching regulator	0.68		2.2	μH
C <sub>VBUS</sub>	VBUS capacitor (without de-rating)	1			μF
C <sub>PMID</sub>	PMID capacitor (without de-rating)	10			μF

### 7.3 Recommended Operating Conditions (続き)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
C <sub>SYS</sub>	SYS capacitor (without de-rating)	20		500	μF
C <sub>BAT</sub>	BAT capacitor (without de-rating)	10			μF

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		BQ25622E			UNIT
		RYK (QFN)			
		18 pins			
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	60.1			°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	42.1			°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	13.0			°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.3			°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	12.8			°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

### 7.5 Electrical Characteristics

V<sub>VBUS\_UVLOZ</sub> < V<sub>VBUS</sub> < V<sub>VBUS\_OVP</sub>, T<sub>J</sub> = -40°C to +125°C, and T<sub>J</sub> = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>QUIESCENT CURRENTS</b>						
I <sub>Q_BAT</sub>	Quiescent battery current (BAT, SYS, SW) when the charger is in the battery only mode, BATFET is enabled, ADC is disabled	VBAT = 4V, No VBUS, BATFET is enabled, I2C enabled, ADC disabled, system is powered by battery. -40 °C < T <sub>J</sub> < 60 °C		1.5	3	μA
I <sub>Q_BAT_ADC</sub>	Quiescent battery current (BAT, SYS, SW) when the charger is in the battery only mode, BATFET is enabled, ADC is enabled	VBAT = 4V, No VBUS, BATFET is enabled, I2C enabled, ADC enabled, system is powered by battery. -40 °C < T <sub>J</sub> < 60 °C		260		μA
I <sub>Q_BAT_SD</sub>	Quiescent battery current (BAT) when the charger is in shutdown mode, BATFET is disabled, ADC is disabled	VBAT = 4V, No VBUS, BATFET is disabled, I2C disabled, in shutdown mode, ADC disabled, T <sub>J</sub> < 60 °C		0.1	0.2	μA
I <sub>Q_BAT_SHIP</sub>	Quiescent battery current (BAT) when the charger is in ship mode, BATFET is disabled, ADC is disabled	VBAT = 4V, No VBUS, BATFET is disabled, I2C disabled, in ship mode, ADC disabled, T <sub>J</sub> < 60 °C		0.15	0.5	μA
I <sub>Q_VBUS</sub>	Quiescent input current (VBUS)	VBUS = 5V, VBAT = 4V, charge disabled, converter switching, ISYS = 0A, PFM enabled		450		μA
I <sub>Q_VBUS_HIZ</sub>	Quiescent input current (VBUS) in HIZ	VBUS = 5V, VBAT = 4V, HIZ mode, ADC disabled		5	20	μA
		VBUS = 15V, VBAT = 4V, HIZ mode, ADC disabled		20	35	μA
<b>VBUS / VBAT SUPPLY</b>						
V <sub>VBUS_OP</sub>	VBUS operating range		3.9		18	V
V <sub>VBUS_UVLO</sub>	VBUS falling to turn off I2C, no battery	VBUS falling	3.0	3.15	3.3	V
V <sub>VBUS_UVLOZ</sub>	VBUS rising for active I2C, no battery	VBUS rising	3.2	3.35	3.5	V

## 7.5 Electrical Characteristics (続き)

$V_{VBUS\_UVLOZ} < V_{VBUS} < V_{VBUS\_OVP}$ ,  $T_J = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , and  $T_J = 25^{\circ}\text{C}$  for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{VBUS\_OVP}$	VBUS overvoltage rising threshold	VBUS rising, $V_{VBUS\_OVP} = 0$	6.1	6.4	6.7	V
$V_{VBUS\_OVPZ}$	VBUS overvoltage falling hreshold	VBUS rising, $V_{VBUS\_OVP} = 0$	5.8	6.0	6.2	V
$V_{VBUS\_OVP}$	VBUS overvoltage rising threshold	VBUS rising, $V_{VBUS\_OVP} = 1$	18.2	18.5	18.8	V
$V_{VBUS\_OVPZ}$	VBUS overvoltage falling threshold	VBUS falling, $V_{VBUS\_OVP} = 1$	17.4	17.7	18.0	V
$V_{SLEEP}$	Enter Sleep mode threshold	(VBUS - VBAT), VBUS falling	9	45	85	mV
$V_{SLEEPZ}$	Exit Sleep mode threshold	(VBUS - VBAT), VBUS rising	115	220	340	mV
$V_{BAT\_UVLOZ}$	BAT voltage for active I2C, turn on BATFET, no VBUS	VBAT rising	2.3	2.4	2.5	V
$V_{BAT\_UVLO}$	BAT voltage to turnoff I2C, turn off BATFET, no VBUS	VBAT falling, $V_{BAT\_UVLO} = 0$	2.1	2.2	2.3	V
		VBAT falling, $V_{BAT\_UVLO} = 1$	1.7	1.8	1.9	V
$V_{POORSRC}$	Bad adapter detection threshold	VBUS falling	3.6	3.7	3.75	V
$I_{POORSRC}$	Bad adapter detection current source			10		mA
<b>POWER-PATH MANAGEMENT</b>						
$V_{SYS\_REG\_ACC}$	Typical system voltage regulation	ISYS = 0A, VBAT > VSYSMIN, Charge Disabled. Offset above VBAT		50		mV
		ISYS = 0A, $V_{BAT} < VSYSMIN$ , Charge Disabled. Offset above VSYSMIN		230		mV
$V_{SYSMIN\_RNG}$	VSYSMIN register range		2.56		3.84	V
$V_{SYSMIN\_REG\_STEP}$	VSYSMIN register step size			80		mV
$V_{SYSMIN\_REG\_ACC}$	Minimum DC system voltage output	ISYS = 0A, $V_{BAT} < VSYSMIN = B00h$ (3.52V), Charge Disabled	3.52	3.75		V
$V_{SYS\_SHORT}$	VSYS short voltage falling threshold to enter forced PFM			0.9		V
$V_{SYS\_SHORTZ}$	VSYS short voltage rising threshold to exit forced PFM			1.1		V
<b>BATTERY CHARGER</b>						
$V_{REG\_RANGE}$	Typical charge voltage regulation range		3.50		4.80	V
$V_{REG\_STEP}$	Typical charge voltage step			10		mV
$V_{REG\_ACC}$	Charge voltage accuracy	$T_J = 25^{\circ}\text{C}$	-0.3		0.3	%
		$T_J = -10^{\circ}\text{C} - 85^{\circ}\text{C}$	-0.4		0.4	%
$I_{CHG\_RANGE}$	Typical charge current regulation range		0.08		3.04	A
$I_{CHG\_STEP}$	Typical charge current regulation step			80		mA
$I_{CHG\_ACC}$	Charge current accuracy	VBAT = 3.1V or 3.8V, ICHG = 1760mA, $T_J = -10^{\circ}\text{C} - 85^{\circ}\text{C}$	-5		5	%
		VBAT = 3.1V or 3.8V, ICHG = 1040mA, $T_J = -10^{\circ}\text{C} - 85^{\circ}\text{C}$	-5.5		5.5	%
		VBAT = 3.1V or 3.8V, ICHG = 320mA, $T_J = -10^{\circ}\text{C} - 85^{\circ}\text{C}$	-5.5		5.5	%
$I_{PRECHG\_RANGE}$	Typical pre-charge current range		20		620	mA
$I_{PRECHG\_STEP}$	Typical pre-charge current step			20		mA

## 7.5 Electrical Characteristics (続き)

$V_{VBUS\_UVLOZ} < V_{VBUS} < V_{VBUS\_OVP}$ ,  $T_J = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , and  $T_J = 25^{\circ}\text{C}$  for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>PRECHG_ACC</sub>	Pre-charge current accuracy when V <sub>BAT</sub> below V <sub>SYSTEMIN</sub> setting	V <sub>BAT</sub> = 2.5V, I <sub>PRECHG</sub> = 500mA, T <sub>J</sub> = -10°C - 85°C	-12		12	%

$t_{WDT}$	Watchdog Reset time (EN_HIZ = 0, WATCHDOG = 11)		136	200		s

## 7.7 Typical Characteristics

$C_{VBUS} = 1 \mu\text{F}$ ,  $C_{PMID} = 10 \mu\text{F}$ ,  $C_{SYS} = 20 \mu\text{F}$ ,  $C_{BAT} = 1 \mu\text{F}$ ,  $L = 1 \mu\text{H}$  (unless otherwise specified)

7-1. Charge Efficiency vs Charge Current

7-2. System Light Load Efficiency vs System Current

7-3. Charge Current Accuracy vs ICHG Setting

7-4. Charge Voltage Accuracy vs VREG Setting

## 7.7 Typical Characteristics (continued)

$C_{VBUS} = 1 \mu\text{F}$ ,  $C_{PMID} = 10 \mu\text{F}$ ,  $C_{SYS} = 20 \mu\text{F}$ ,  $C_{BAT} = 1 \mu\text{F}$ ,  $L = 1 \mu\text{H}$  (unless otherwise specified)

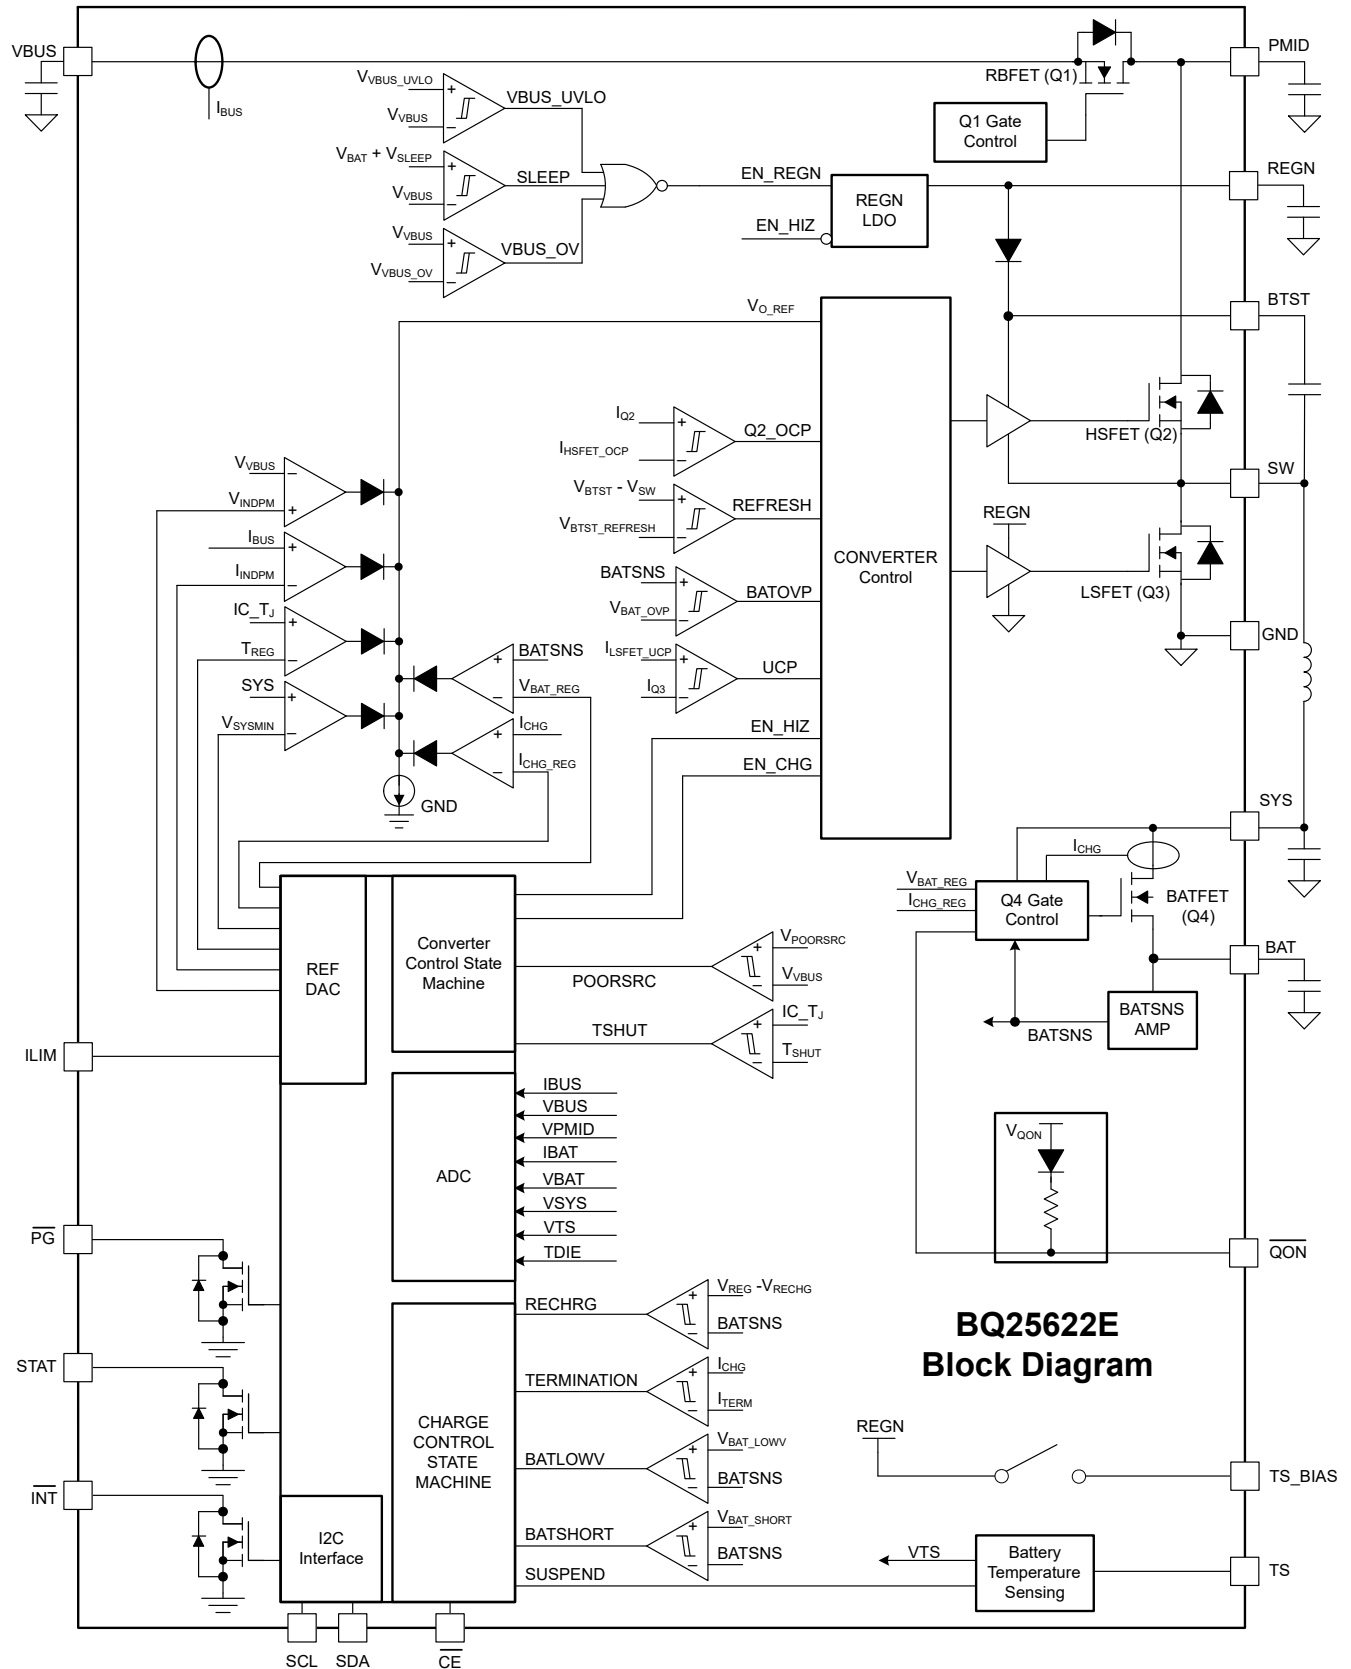

## 8 Detailed Description

### 8.1 Overview

The BQ25622E is a highly-integrated 3-A switch-mode battery charger for single-cell Li-ion and Li-polymer batteries. The device includes input reverse-blocking FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), battery FET (BATFET, Q4), and bootstrap diode for the high-side gate driver.

## 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Power-On-Reset (POR)

The BQ25622E powers internal bias circuits from the higher voltage of VBUS and BAT. When either voltage rises above its undervoltage lockout (UVLO) threshold, all registers are reset to their POR values and the I<sup>2</sup>C interface is enabled for communication. A non-maskable  $\overline{\text{INT}}$  pulse is generated, after which the host can access all of the registers.

### 8.3.2 Device Power Up from Battery

If only the battery is present and the VBAT is above depletion threshold ( $V_{\text{BAT\_UVLOZ}}$ ), the BQ25622E performs a power-on reset then turns on the BATFET to connect the battery to system. The REGN LDO output remains off to minimize the quiescent current. The low RDSON of BATFET and the low quiescent current on BAT minimize the conduction loss and maximize the battery run time.

### 8.3.3 Device Power Up from Input Source

When a valid input source is plugged in with  $\text{VBAT} < V_{\text{BAT\_UVLOZ}}$ , the BQ25622E performs a power-on reset then checks the input source voltage to turn on the REGN LDO and all the bias circuits. It detects and sets the input current limit before the buck converter is started. The power up sequence from input source is as listed:

1. REGN LDO power up ([セクション 8.3.3.1](#))
2. Poor source qualification ([セクション 8.3.3.2](#))
3. Input voltage limit threshold setting ([セクション 8.3.3.4](#))
4. Converter power-up ([セクション 8.3.3.5](#))

#### 8.3.3.1 REGN LDO Power Up

The REGN LDO regulator supplies internal bias circuits as well as the HSFET and LSFET gate drive. The REGN LDO also provides bias rail to TS external resistors. The pull-up rail of STAT can be connected to REGN as well. The REGN is enabled when all the below conditions are valid:

- VBUS above  $V_{\text{VBUS\_UVLOZ}}$
- VBUS above  $V_{\text{BAT}} + V_{\text{SLEEPZ}}$
- EN\_HIZ = 0
- After 220-ms delay is completed

If any one of the above conditions is not valid, the REGN LDO and the converter power stage remain off with the converter disabled. In this state, the battery supplies power to the system.

#### 8.3.3.2 Poor Source Qualification

After the REGN LDO powers up, the device checks the current capability of the input source. The input source has to meet the following requirements in order to move forward to the next power on steps.

1. VBUS voltage below  $V_{\text{VBUS\_OVP}}$
2. VBUS voltage above  $V_{\text{POORSRC}}$  when pulling  $I_{\text{POORSRC}}$

Once these conditions are met, the device proceeds to input source type detection.

#### 8.3.3.3 ILIM Pin

The ILIM pin clamps the input current limit to  $I_{\text{INREG}} = K_{\text{ILIM}} / R_{\text{ILIM}}$ , where  $R_{\text{ILIM}}$  is connected from the ILIM pin to GND. The ILIM pin can be used to limit the input current limit from 100 mA - 3.2 A. The input current is limited to the lower of the two values set by the ILIM pin and IINDPDM register bits. The ILIM pin can also be used to monitor input current. The input current is proportional to the voltage on the ILIM pin and can be calculated by  $I_{\text{IN}} = (K_{\text{ILIM}} \times V_{\text{ILIM}}) / (R_{\text{ILIM}} \times 0.8)$ . The ILIM pin function is disabled when the EN\_EXTILIM bit is set to 0.

An RC filter in parallel with  $R_{\text{ILIM}}$  is required when the input current setting on the ILIM pin is either:

- below 400 mA or
- above 2 A when using a 2.2- $\mu\text{H}$  inductor

The value for the RC filter is 1.2 k $\Omega$  and 330 nF, respectively.

### 8.3.3.4 Input Voltage Limit Threshold Setting (VINDPM Threshold)

The BQ25622E supports a wide range of input voltage limit (3.8 V – 16.8 V). Its POR default VINDPM threshold is set at 4.6 V. The BQ25622E also supports dynamic VINDPM tracking, which tracks the battery voltage to ensure a sufficient margin between input and battery voltages for proper operation of the buck converter. This function is enabled via the VINDPM\_BAT\_TRACK register bit. When enabled, the actual input voltage limit is the higher of the VINDPM register or  $V_{INDPM\_BAT\_TRACK}$  ( $V_{BAT} + 400\text{-mV}$  typical offset.)

### 8.3.3.5 Converter Power-Up

After the input current and voltage limits are set, the converter is enabled and the HSFET and LSFET start switching. If battery charging is disabled, the BATFET turns off. Otherwise, the BATFET stays on to charge the battery. Converter startup requires the following conditions:

- VBUS has passed poor source qualification (refer to [セクション 8.3.3.2](#))
- $V_{BUS} > V_{BAT} + V_{SLEEPZ}$
- $V_{VBUS} < V_{VBUS\_OVP}$
- $EN\_HIZ = 0$
- $V_{SYS} < V_{SYS\_OVP}$
- $T_J < T_{SHUT}$

The BQ25622E provides soft start when the system rail is ramped up by setting IINDPM to its lowest programmable value and stepping up through each available setting until reaching the value set by IINDPM register. Concurrently, the system short protection limits the output current to approximately 0.5 A when the system rail is below  $V_{SYS\_SHORT}$ .

The device uses a highly efficient 1.5-MHz, fixed frequency pulse width modulated (PWM) step-down switching regulator. The internally compensated feedback loop keep tight control of the switching frequency under all conditions of input voltage, battery voltage, charge current and temperature, simplifying output filter design.

The device switches to pulse frequency modulation (PFM) control at light load condition. The PFM\_FWD\_DIS bit can be used to disable the PFM operation.

## 8.3.4 Power Path Management

The BQ25622E accommodates a wide range of input sources from a USB, wall adapter, wireless charger, to car charger. It provides automatic power path selection to supply the system from an input source, battery, or both.

### 8.3.4.1 Narrow VDC Architecture

The BQ25622E uses the Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by VSYSMIN register setting. Even with a fully depleted battery, the system is regulated to the minimum system voltage. If charging is enabled, the BATFET operates in linear mode (LDO mode). The default minimum system voltage at POR is 3.52 V.

As the battery voltage rises above the minimum system voltage, the BATFET is turned fully on. When battery charging is disabled and  $V_{BAT}$  is above the minimum system voltage setting, or charging is terminated, the system is regulated 50 mV (typical) above battery voltage.

### 8.3.4.2 Dynamic Power Management

To meet the USB maximum current limit and avoid overloading the adapter, the device features Dynamic Power Management (DPM), which continuously monitors the input current and input voltage. When the input source is overloaded, either the current exceeds the input current limit (IINDPM) or the voltage falls below the input voltage limit (VINDPM). The device then reduces the charge current until the input current falls below the input current limit and the input voltage rises above the input voltage limit.

When the charge current is reduced to zero, but the input source is still overloaded, the system voltage starts to drop. Once the system voltage falls below the battery voltage by  $V_{SUPP}$ , the device automatically enters the

supplement mode where the BATFET turns on and the battery starts discharging so that the system is supported from both the input source and battery.

### 8.3.4.3 High Impedance Mode

The host may place the BQ25622E into high impedance mode by writing EN\_HIZ = 1. In high impedance mode, RBFET (Q1), HSFET (Q2) and LSFET (Q3) are turned off. The RBFET and HSFET block current flow to and from VBUS, putting the VBUS pin into a high impedance state. The BATFET (Q4) is turned on to connect the BAT to SYS. During high impedance mode, REGN is disabled and the digital clock is slowed to conserve power.

### 8.3.5 Battery Charging Management

The BQ25622E charges a 1-cell Li-Ion battery with up to a 3.0-A charge current. The 15-mΩ BATFET improves charging efficiency and minimizes the voltage drop during discharging.

#### 8.3.5.1 Autonomous Charging Cycle

When battery charging is enabled (EN\_CHG bit = 1 and  $\overline{CE}$  pin is LOW), the BQ25622E autonomously completes a charging cycle without host involvement. The device default charging parameters are listed in [表 8-1](#). The host can always control the charging operations and optimize the charging parameters by writing to the corresponding registers through I<sup>2</sup>C.

**表 8-1. Charging Parameter Default Setting**

	VREG	VRECHG	ITRICKLE	IPRECHG	ICHG	ITERM	TOPOFF TIMER
BQ25622E	4.2 V	VREG - 100 mV	20 mA	100 mA	1040 mA	60 mA	Disabled

A new charge cycle starts when the following conditions are valid:

- Converter starts per the conditions in [セクション 8.3.3.5](#)
- EN\_CHG = 1
- $\overline{CE}$  pin is low
- No thermistor fault on TS
- No safety timer fault

The BQ25622E automatically terminates the charging cycle when the charging current is below termination threshold, battery voltage is above recharge threshold, and device not is in DPM or thermal regulation. When a fully charged battery is discharged below VRECHG, the device automatically starts a new charging cycle. After charging terminates, toggling  $\overline{CE}$  pin or EN\_CHG bit also initiates a new charging cycle.

The STAT output indicates the charging status. Refer to [セクション 8.3.7.3](#) for details of STAT pin operation. In addition, the status register (CHG\_STAT) indicates the different charging phases: 00-charging disabled or terminated, 01-constant current, 10 constant voltage, 11-topoff charging.

#### 8.3.5.2 Battery Charging Profile

The BQ25622E charges the battery in five phases: trickle charge, pre-charge, constant current, constant voltage and an optional top-off charging phase. At the beginning of a charging cycle, the device checks the battery voltage and regulates current and voltage accordingly.

図 8-1. Battery Charging Profile

### 8.3.5.3 Charging Termination

The BQ25622E terminates a charge cycle when the battery voltage is above recharge threshold, the converter is in constant-voltage regulation and the current is below  $I_{TERM}$ . Because constant-voltage regulation is required for termination, the BQ25622E does not terminate while  $IINDPM$ ,  $VINDPM$  or thermal regulation loops are active. After the charging cycle is completed, the BATFET turns off. The converter keeps running to power the system, and the BATFET can turn on again to engage supplement mode. Termination can be permanently disabled by writing 0 to  $EN\_TERM$  bit prior to charge termination.

At low termination currents, due to the comparator offset, the actual termination current may be 10 mA to 20 mA higher than the termination target. In order to compensate for comparator offset, a programmable top-off timer can be applied after termination is detected. The top-off timer follows safety timer constraints, such that if the safety timers suspend, so does the top-off timer. Similarly, if the safety timers count at half-clock rate, so does the top-off timer. Refer to [セクション 8.3.5.5](#) for the list of conditions. The host can read  $CHG\_STAT$  to find out the termination status.

Top-off timer gets reset by any of the following conditions:

1. Charging cycle stop and restart (toggle CE pin, toggle  $EN\_CHG$  bit, charged battery falls below recharge threshold or adapter removed and replugged)
2. Termination status low to high
3.  $REG\_RST$  register bit is set

The top-off timer settings are read in after is detected by the charger. Programming a top-off timer value after termination has no effect unless a recharge cycle is initiated.  $CHG\_FLAG$  is set to 1 when entering top-off timer segment and again when the top-off timer expires.

### 8.3.5.4 Thermistor Qualification

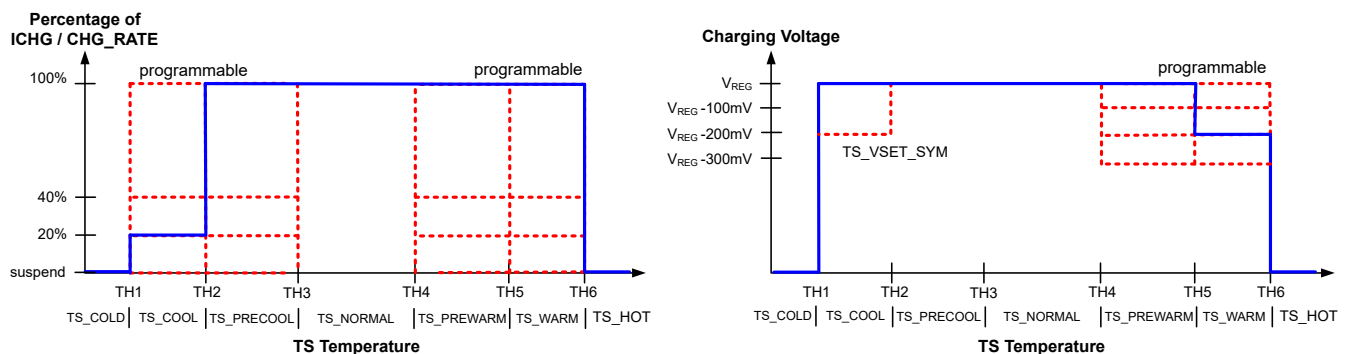

The BQ25622E provides a single thermistor input for battery temperature monitoring. The TS pin input of the battery temperature can be ignored by the charger if  $TS\_IGNORE = 1$ . When the TS pin feedback is ignored, the charger considers the TS to always be valid for charging mode and  $TS\_STAT$  always reports 000. The TS pin may be left floating if  $TS\_IGNORE$  is set to 1.

When  $TS\_IGNORE=1$ , the  $TS\_ADC$  channel is disabled, with  $TS\_ADC\_DIS$  forced to 1; Attempting to write to 0 is ignored.

When  $TS\_IGNORE = 0$ , the charger adjusts the charging profile based on the TS pin feedback information according to the configurable profile described in [セクション 8.3.5.4.1](#). When the battery temperature crosses from one temperature range to another,  $TS\_STAT$  is updated accordingly, and the charger sets the FLAG bit for the newly-entered temperature range. If  $TS\_MASK$  is set to 0, any change to  $TS\_STAT$ , including a transition to  $TS\_NORMAL$ , generates an  $\overline{INT}$  pulse.

#### 8.3.5.4.1 Advanced Temperature Profile in Charge Mode

To improve the safety of charging Li-ion batteries, JEITA guideline was released on April 20, 2007. The guideline emphasized the importance of avoiding a high charge current and high charge voltage at certain low and high temperature ranges. As battery technology continues to evolve, battery manufacturers have released temperature safety specifications that extend beyond the JEITA standard. The BQ25622E features a highly flexible temperature-based charging profile to meet these advanced specifications while remaining backwards compatible with the original JEITA standard. [図 8-2](#) shows the programmability for charger behavior under different battery temperature (TS) operating regions.

**図 8-2. TS Charging Values**

Charging safety timer is adjusted within the temperature zones to reflect changes to the charging current. When  $IPRECHG$  and  $ICHG$  are reduced to 20% or 40% in the cool or warm temperature zones, the charging safety timer counts at half rate. If charging is suspended, the safety timer is suspended, the STAT pin blinks and  $CHG\_STAT$  is set to 00 (not charging or charge terminated.)

#### 8.3.5.4.2 TS Pin Thermistor Configuration

The typical TS resistor network is illustrated below.

**図 8-3. TS Resistor Network**

The value of  $RT1$  and  $RT2$  are determined from the resistance of the thermistor at 0 and 60°C ( $R_{TH_{0degC}}$  and  $R_{TH_{60degC}}$ ) and the corresponding voltage thresholds  $V_{TS_{0degC}}$  and  $V_{TS_{60degC}}$  (expressed as percentage of

REGN with value between 0 and 1). For the most accurate thermistor curve fitting, use the rising threshold for  $V_{TS\_COLD}$  at 0°C and the falling threshold for  $V_{TS\_HOT}$  at 60°C, regardless of the actual register settings for TS\_TH1\_TH2\_TH3 and TS\_TH4\_TH5\_TH6.

$$RT2 = \frac{RTH_{0degC} \times RTH_{60degC} \times \left( \frac{1}{V_{TS\_0degC}} - \frac{1}{V_{TS\_60degC}} \right)}{RTH_{60degC} \times \left( \frac{1}{V_{TS\_60degC}} - 1 \right) - RTH_{0degC} \times \left( \frac{1}{V_{TS\_0degC}} - 1 \right)} \quad (1)$$

$$RT1 = \frac{\frac{1}{V_{TS\_0degC}} - 1}{\frac{1}{RT2} + \frac{1}{RTH_{0degC}}} \quad (2)$$

Assuming a 103AT NTC thermistor on the battery pack, the RT1 and RT2 are calculated to be 5.32 kΩ and 30.1 kΩ respectively.

#### 8.3.5.4.3 JEITA Charge Rate Scaling

The TS\_ISET\_PRECOOL, TS\_ISET\_COOL, TS\_ISET\_PREWARM and TS\_ISET\_WARM cool and warm charge current fold backs are based on a 1C charging rate. The 1C rate is the battery capacity in mA-hours divided by 1 hour, so that a 500 mA-hour battery would have a 1C charging rate of 500 mA. The same battery would have a 2C charging rate of 1,000 mA. In order to convert the charging foldback, the host must set the CHG\_RATE register to the C rate for the battery. This scales the foldback accordingly.

When TS\_ISET\_PRECOOL, TS\_ISET\_COOL, TS\_ISET\_PREWARM or TS\_ISET\_WARM is set to either 00 (suspend) or 11 (unchanged), the CHG\_RATE setting has no effect. A summary is provided in 表 8-2.

**表 8-2. ICHG Fold Back**

TS_ISET_PRECOOL, TS_ISET_COOL, TS_ISET_PREWARM or TS_ISET_WARM	CHG_RATE	FOLD-BACK CURRENT AS PERCENTAGE OF ICHG
00	Any	0% (Suspended)
01 (20%)	00 (1C)	20%
	01 (2C)	10%
	10 (4C)	5%
	11 (6C)	3.3%
10 (40%)	00 (1C)	40%
	01 (2C)	20%
	10 (4C)	10%
	11 (6C)	6.6%
11	Any	100%

#### 8.3.5.4.4 TS\_BIAS Pin

The BQ25622E has the TS\_BIAS pin to isolate the battery temperature sensing thermistor and associated resistor-divider from REGN. The 103AT thermistor with typical resistor-divider network requires about 400 μA to bias. The BQ25622E provides the TS\_BIAS pin, which is internally connected to the REGN LDO via a back-to-back MOSFET switch. When no temperature measurement is being taken, the switch is disabled to disconnect the thermistor and resistor-divider from the REGN LDO, saving the 400-μA bias current from being expended unnecessarily.

The TS\_BIAS pin has short-circuit protection. If a short is detected on the TS\_BIAS pin, the switch is disabled to disconnect the short from REGN. If this condition occurs, TS\_STAT register is set to 0x3. Charging is suspended until the short is removed.

### 8.3.5.5 Charging Safety Timers

The BQ25622E has three built-in safety timers to prevent extended charging cycle due to abnormal battery conditions. The fast charge safety timer and pre-charge safety timers are set through I<sup>2</sup>C CHG\_TMR and PRECHG\_TMR fields, respectively. The trickle charge timer is fixed at 1 hour.

The trickle charging, pre-charging and fast charging safety timers can be disabled by setting EN\_SAFETY\_TMRS = 0. EN\_SAFETY\_TMRS can be enabled anytime regardless of which charging stage the charger is in. Each timer starts to count as soon as the following two conditions are simultaneously true: EN\_SAFETY\_TMRS=1 and the corresponding charging stage is active.

When either the fast charging, trickle charging or pre-charging safety timer expires, the SAFETY\_TMR\_STAT and SAFETY\_TMR\_FLAG bits are set to 1.

Events that cause a reduction in charging current also cause the charging safety timer to count at half-clock rate if TMR2X\_EN bit is set.

During faults which suspend charging, the charge, pre-charge and trickle safety timers are also suspended, regardless of the state of the TMR2X\_EN bit. Once the fault goes away, charging resumes and the safety timer resumes from where it stopped.

The charging safety timer and the charging termination can be disabled at the same time. Under this condition, the charging keeps running until it is disabled by the host.

### 8.3.6 Integrated 12-Bit ADC for Monitoring

The BQ25622E provides an integrated 12-bit ADC for the host to monitor various system parameters.

To enable the ADC, the ADC\_EN bit must be set to '1'. The ADC is disabled by default (ADC\_EN = 0) to conserve power. The ADC is allowed to operate if either  $V_{BUS} > V_{POORSRC}$  or  $V_{BAT} > V_{BAT\_LOWV}$  is valid. If ADC\_EN is set to '1' before  $V_{BUS}$  or  $V_{BAT}$  reach their respective valid thresholds, then ADC\_EN stays '0'. The host can enable the ADC during HIZ mode by setting ADC\_EN = 1.

At battery only condition, if the TS\_ADC channel is enabled, the ADC only operates when the battery voltage is higher than 3.2 V (the minimal value to turn on REGN), otherwise, the ADC operates when the battery voltage is higher than  $V_{BAT\_LOWV}$ .

The ADC\_DONE\_STAT, ADC\_DONE\_FLAG bits are set when a conversion is complete in one-shot mode only. During continuous conversion mode, the ADC\_DONE\_STAT, ADC\_DONE\_FLAG bits have no meaning and remain at 0. In one-shot mode, the ADC\_EN bit is set to 0 at the completion of the conversion, at the same time as the ADC\_DONE\_FLAG bit is set. In continuous mode, the ADC\_EN bit remains at 1 until the user disables the ADC by setting it to 0.

### 8.3.7 Status Outputs ( $\overline{PG}$ , STAT, $\overline{INT}$ )

#### 8.3.7.1 $\overline{PG}$ Pin Power Good Indicator

The  $\overline{PG}$  pin goes LOW to indicate a good input source when:

- $V_{BUS}$  is above  $V_{BUS\_UVLOZ}$
- $V_{BUS}$  is above battery (not in sleep)
- $V_{BUS}$  is below  $V_{BUS\_OVP}$  threshold
- $V_{BUS}$  is above  $V_{POORSRC}$  when  $I_{POORSRC}$  current is applied (not a poor source)

#### 8.3.7.2 Interrupts and Status, Flag and Mask Bits

The device incorporates an interrupt pin ( $\overline{INT}$ ) to inform a host microcontroller of status changes without requiring microcontroller polling. Each reported event has a status field, a flag bit and a mask bit. The status field reports the status at the time that it is read. The flag bit is latched and, once set to 1, will remain at 1 until the host reads the bit, which will clear it to 0. The mask bit determines whether or not an interrupt pulse will be generated when the flag bit is set.

図 8-4. Relationship Between STAT, FLAG, and MASK

The flag bit is set upon certain transitions of the status field. These transitions also generate an  $\overline{INT}$  pulse if the associated mask bit is set to 0. Because the  $\overline{INT}$  is generated from the status field transition and not the flag bit, an  $\overline{INT}$  pulse is sent to the host even if the associated flag is already set to 1 when the status transition occurs. Details of this behavior are shown in 図 8-4.

The default behavior is to generate a 256- $\mu$ s  $\overline{INT}$  pulse when any flag bit is set to 1. These pulses may be masked out on a flag-by-flag basis by setting a flag's mask bit to 1. Setting the mask bit does not affect the transition of the flag bit from 0 to 1, only the generation of the 256- $\mu$ s  $\overline{INT}$  pulse.

### 8.3.7.3 Charging Status Indicator (STAT)

The BQ25622E indicates charging state on the open drain STAT pin. The STAT pin can drive an LED. The STAT pin function can be disabled via the DIS\_STAT bit.

表 8-3. STAT Pin State

CHARGING STATE	STAT INDICATOR
Charging in progress (including recharge)	LOW
Not charging, no fault detected. (Includes charging complete, Charge Disabled, no adapter present.)	HIGH
Charge suspend	Blinking at 1 Hz

### 8.3.7.4 Interrupt to Host ( $\overline{INT}$ )

In many applications, the host does not continually poll the charger status registers. Instead, the INT pin may be used to notify the host of a status change with a 256- $\mu$ s  $\overline{INT}$  pulse. Upon receiving the interrupt pulse, the host may read the flag registers (Charger\_Flag\_X and FAULT\_Flag\_X) to determine the event that caused the interrupt, and for each flagged event, read the corresponding status registers (Charger\_Status\_X and FAULT\_Status\_X) to determine the current state. Once set to 1, the flag bits remain latched at 1 until they are read by the host, which clears them. The status bits, however, are updated whenever there is a change to status and always represent the current state of the system.

All of the  $\overline{INT}$  events can be masked off to prevent  $\overline{INT}$  pulses from being sent out when they occur, with the exception of the initial power-up interrupt. Interrupt events are masked by setting their mask bit in registers (Charger\_Mask\_X and FAULT\_Mask\_X). Events always cause the corresponding flag bit to be set to 1, regardless of whether or not the interrupt pulse has been masked.

### 8.3.8 BATFET Control

The BQ25622E has an integrated, bi-directionally blocking BATFET that can be turned off to remove leakage current from the battery to the system. The BATFET is controlled by the BATFET\_CTRL register bits, and supports shutdown mode, ship mode and system power reset.

表 8-4. BATFET Control Modes

MODE	BATFET	I <sup>2</sup> C	ENTRY, NO ADAPTER	ENTRY, WITH ADAPTER, BATFET_CTRL_WVBUS = 0	ENTRY, WITH ADAPTER, BATFET_CTRL_WVBUS = 1	EXIT
Normal	On	Active	N/A	N/A	N/A	N/A
Ship mode	Off	Off	Writing BATFET_CTRL = 10 turns off BATFET after BATFET_DLY and enters ship mode.	Writing BATFET_CTRL = 10 has no effect while adapter is present. When both BATFET_DLY has expired and the adapter is removed, the device turns off BATFET and enters ship mode. Writing BATFET_CTRL = 00 before adapter is removed aborts ship mode.	Writing BATFET_CTRL = 10 turns off BATFET after BATFET_DLY. When both BATFET_DLY has expired and adapter is removed, the device enters ship mode. Writing BATFET_CTRL = 00 before adapter is removed turns BATFET on and aborts ship mode.	$\overline{QON}$ or adapter plug-in
System reset	On to Off to On	Active	Writing BATFET_CTRL = 11 initiates system reset after BATFET_DLY. Holding $\overline{QON}$ low for $t_{QON\_RST}$ initiates immediate reset (BATFET_DLY is not applied.)	Writing BATFET_CTRL = 11 is ignored and BATFET_CTRL resets to 00. Holding $\overline{QON}$ low for $t_{QON\_RST}$ is ignored.	Writing BATFET_CTRL = 11 initiates system reset after BATFET_DLY. Holding $\overline{QON}$ low for $t_{QON\_RST}$ initiates immediate reset. Converter is placed in HIZ during system reset and exits HIZ when system reset completes.	N/A
Shutdown mode	Off	Off	Writing BATFET_CTRL = 01 turns off BATFET after BATFET_DLY and enters shutdown.	Writing BATFET_CTRL = 01 with adapter present is ignored, regardless of BATFET_CTRL_WVBUS setting, and BATFET_CTRL is reset to 00.		Adapter plug-in

### 8.3.8.1 Shutdown Mode

For the lowest battery leakage current, the host can shut down the BQ25622E by setting the register bits BATFET\_CTRL to 01. In this mode, the BATFET is turned off to prevent the battery from powering the system, the I<sup>2</sup>C is disabled and the charger is totally shut down. The BQ25622E can only be woken up by plugging in an adapter. When the adapter is plugged in, the BQ25622E starts back up with all register settings in their POR default.

After the host sets BATFET\_CTRL to 01, the BATFET turns off after waiting either 20 ms or 10 s as configured by BATFET\_DLY register bit. Shutdown mode can only be entered when  $V_{VBUS} < V_{VBUS\_UVLO}$ , regardless of the BATFET\_CTRL\_WVBUS setting, which has no effect on shutdown mode entry. If the host writes BATFET\_CTRL = 01 with  $V_{VBUS} > V_{VBUS\_UVLO}$ , the request is ignored and the BATFET\_CTRL bits are set back to 00.

$\overline{QON}$  has no effect during shutdown mode. The internal pull-up on the  $\overline{QON}$  pin is disabled during shutdown to prevent leakage through the pin.

### 8.3.8.2 Ship Mode

The host may place the BQ25622E into ship mode by setting BATFET\_CTRL = 10. In ship mode, the BATFET is turned off to prevent the battery from powering the system, and the I<sup>2</sup>C is disabled. Ship mode has slightly higher quiescent current than shutdown mode, but  $\overline{QON}$  may be used to exit from ship mode. The BQ25622E is taken out of ship mode by either of these methods:

- Pulling the  $\overline{QON}$  pin low for  $t_{SM\_EXIT}$
- $V_{VBUS} > V_{VBUS\_UVLOZ}$  (adapter plug-in)

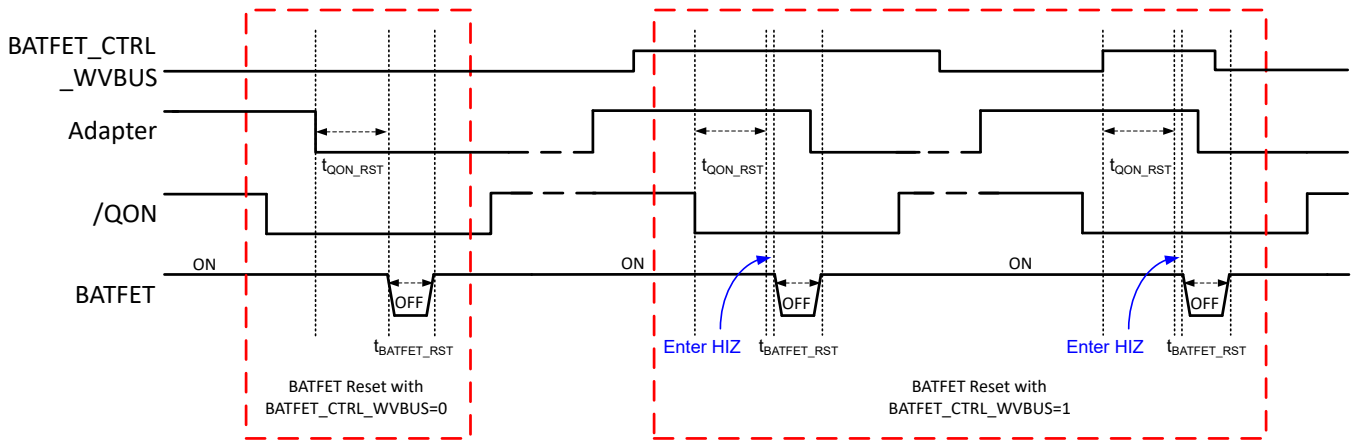

When the BQ25622E exits from ship mode, the registers are reset to their POR values.

Ship mode is only entered when the adapter is not present. Setting  $BATFET\_CTRL = 10$  while  $V_{VBUS} > V_{VBUS\_UVLOZ}$  (adapter present) either disables the BATFET or has no immediate effect depending on the setting of  $BATFET\_CTRL\_WVBUS$ .

### 8.3.8.3 System Power Reset

The BATFET functions as a load switch between battery and system when the converter is not running. By changing the state of BATFET from on to off, systems connected to SYS can be power cycled. Any of the following conditions initiates a system power reset:

- $BATFET\_CTRL\_WVBUS = 1$  and  $\overline{QON}$  is pulled low for  $t_{QON\_RST}$
- $BATFET\_CTRL\_WVBUS = 1$  and  $BATFET\_CTRL = 11$
- $BATFET\_CTRL\_WVBUS = 0$  and  $V_{BUS} < V_{VBUS\_UVLO}$  simultaneously with  $\overline{QON}$  pulled low for  $t_{QON\_RST}$
- $BATFET\_CTRL\_WVBUS = 0$  and  $V_{BUS} < V_{VBUS\_UVLO}$  and  $BATFET\_CTRL = 11$

8-5. System Power Reset Timing

When  $BATFET\_CTRL\_WVBUS$  is set to 1, system power reset proceeds if either  $BATFET\_CTRL$  is set to 11 or  $\overline{QON}$  is pulled low for  $t_{QON\_RST}$ , regardless of whether  $V_{BUS}$  is present or not. There is a delay of  $t_{BATFET\_DLY}$  before initiating the system power reset. If  $\overline{QON}$  is pulled low, there is no delay after the  $t_{QON\_RST}$  completes, regardless of  $BATFET\_DLY$  setting.

The system power reset can be initiated from the battery only condition or from the forward charging mode with adapter present.

### 8.3.9 Protections

#### 8.3.9.1 Voltage and Current Monitoring in Battery Only and HIZ Modes

The BQ25622E monitors a reduced set of voltages and currents when operating from battery without an adapter or when operating from battery in high impedance mode.

##### 8.3.9.1.1 Battery Undervoltage Lockout

In battery-only mode, the BQ25622E disables the BATFET if  $V_{BAT}$  falls below  $V_{BAT\_UVLO}$ , separating the system from the battery.  $I^2C$  is disabled as well. Upon exit from the undervoltage lockout condition when either  $V_{BAT}$  rises above  $V_{BAT\_UVLOZ}$  or  $V_{VBUS}$  rises above  $V_{VBUS\_UVLOZ}$ ,  $I^2C$  will be re-enabled and the registers are reset to their POR values.

### 8.3.9.1.2 Battery Overcurrent Protection

The BQ25622E has a two-level battery overcurrent protection. The  $I_{BAT\_PK}$  threshold is set by IBAT\_PK and provides a fast (100  $\mu$ s) protection for the battery discharging.  $I_{BATFET\_OCP}$  provides a slower (50 ms), fixed-threshold protection for the BATFET. If the battery discharge current becomes higher than either threshold for its protection timer, the BAT\_FAULT\_STAT and BAT\_FAULT\_FLAG fault register bits are set to 1, and the BATFET enters hiccup mode with 100-ms off-time and ~1% on-time. The BAT\_FAULT\_STAT will return to 0 once the BATFET is disabled for the hiccup mode. Once the BATFET is turned back on, the  $I_{BAT\_PK}$  and  $I_{BATFET\_OCP}$  thresholds are re-evaluated.

### 8.3.9.2 Voltage and Current Monitoring in Buck Mode

#### 8.3.9.2.1 Input Overvoltage

If VBUS voltage rises above  $V_{VBUS\_OVP}$ , the converter stops switching to protect the internal power MOSFETs and  $I_{PMID\_LOAD}$  discharge current is applied to bring down VBUS voltage. VBUS\_FAULT\_FLAG and VBUS\_FAULT\_STAT are set to 1. When VBUS falls back below  $V_{VBUS\_OVPZ}$ , VBUS\_OVP\_STAT will transition to 0 and the converter will resume switching.

#### 8.3.9.2.2 System Overvoltage Protection (YSOVP)

When VSYS rises above the  $V_{SYS\_OVP}$  threshold (around 250 mV above VBAT when not charging) in forward converter operation, the converter stops switching to limit voltage overshoot and applies  $I_{SYS\_LOAD}$  to pull down the system voltage. VSYS\_FAULT\_FLAG and VSYS\_FAULT\_STAT are set to 1. Once VSYS drops below  $V_{SYS\_OVP}$ , the converter resumes switching, the 30 mA discharge current is removed and VSYS\_FAULT\_STAT transitions to 0.

#### 8.3.9.2.3 Forward Converter Cycle-by-Cycle Current Limit

The converter has cycle-by-cycle peak overcurrent protection in the switching MOSFETs. In forward mode, if the current through Q2 exceeds  $I_{HSFET\_OCP}$ , the converter will immediately turn off the high-side gate drive for the remainder of the switching cycle. Normal switching resumes on the next switching cycle.

#### 8.3.9.2.4 System Short

When the SYS voltage falls below  $V_{SYS\_SHORT}$ , the charger enters PFM operation to limit the output current to approximately 0.5 A or less. SYS\_FAULT\_STAT and SYS\_FAULT\_FLAG bits are set to 1. If VSYS rises above  $V_{SYS\_SHORTZ}$ , the converter exits forced PFM mode, and the SYS\_FAULT\_STAT bit is set to 0.

#### 8.3.9.2.5 Battery Overvoltage Protection (BATOVP)

When  $V_{BAT}$  transitions above  $V_{BAT\_OVP}$ , the BQ25622E disables charging by disabling the BATFET and applies  $I_{BAT\_LOAD}$  current source to discharge excess BAT voltage. If battery voltage remains above the threshold, BAT\_FAULT\_FLAG is set to 1 and BAT\_FAULT\_STAT transitions to 1. Once  $V_{BAT}$  falls below  $V_{BAT\_OVPZ}$ , charging resumes and BAT\_FAULT\_STAT transitions back to 0.

#### 8.3.9.2.6 Sleep and Poor Source Comparators

The sleep comparator is used to suspend the converter if the adapter voltage is insufficient to maintain buck converter operation while charging the battery. If  $V_{VBUS}$  falls below  $V_{BAT} + V_{SLEEP}$ , the converter stops switching, the  $\overline{PG}$  pin transitions high, and VBUS\_FAULT\_STAT and VBUS\_FAULT\_FLAG are set to 1. If  $V_{VBUS}$  rises back above  $V_{BAT} + V_{SLEEPZ}$ , the converter restarts, and the  $\overline{PG}$  pin transitions low.

If  $V_{VBUS}$  falls below  $V_{POORSRC}$ , the converter stops switching and the  $\overline{PG}$  pin transitions high (if not already suspended and high due to the sleep comparator), and the VBUS\_STAT transitions to 000 and the device transitions to battery-only mode. If  $V_{VBUS}$  rises above  $V_{POORSRC}$ , it is a new adapter attach, and poor source qualification will be run in addition to D+/D- detection if enabled. VBUS\_STAT and the  $\overline{PG}$  pin state will be determined by the adapter attach sequence as outlined in [セクション 8.3.3](#).

### 8.3.9.3 Thermal Regulation and Thermal Shutdown

#### 8.3.9.3.1 Thermal Protection in Buck Mode

The BQ25622E monitors the internal junction temperature  $T_J$  to avoid overheating the chip and limits the IC junction temperature in buck mode. When the internal junction temperature exceeds the  $T_{REG}$  thermal regulation limit (TREG register configuration), the device lowers the charging current. During thermal regulation, the safety timer runs at half the clock rate, and the TREG\_FLAG and TREG\_STAT bits are set to 1. Additionally, the device has thermal shutdown to turn off the converter and BATFET when IC junction temperature exceeds  $T_{SHUT}$ . The fault bit TSHUT\_FLAG is set to 1 and TSHUT\_STAT transitions to 1. The BATFET and converter are re-enabled when IC temperature is  $T_{SHUT\_HYS}$  below  $T_{SHUT}$ , and TSHUT\_STAT transitions to 0.

#### 8.3.9.3.2 Thermal Protection in Battery-Only Mode

The BQ25622E monitors the internal junction temperature  $T_J$  to avoid overheating the chip and limits the IC junction temperature in battery-only mode. The device has thermal shutdown to turn off the BATFET when IC junction temperature exceeds  $T_{SHUT}$ . The fault bit TSHUT\_FLAG is set to 1 and TSHUT\_STAT transitions to 1. The BATFET is re-enabled when IC temperature is  $T_{SHUT\_HYS}$  below  $T_{SHUT}$ , and TSHUT\_STAT transitions to 0.

## 8.4 Device Functional Modes

### 8.4.1 Host Mode and Default Mode

The device is a host controlled charger, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous charger with no host or while host is in sleep mode. When the charger is in default mode, WD\_STAT bit becomes HIGH, WD\_FLAG is set to 1, and an  $\overline{INT}$  is asserted low to alert the host (unless masked by WD\_MASK). The WD\_FLAG bit would read as 1 upon the first read and then 0 upon subsequent reads. When the charger is in host mode, WD\_STAT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired. All the registers are in the default settings.

In default mode, the device keeps charging the battery with default 1-hour trickle charging safety timer, 2-hour pre-charging safety timer and the 12-hour fast charging safety timer. At the end of the 1-hour or 2-hour or 12-hour timer expired, the charging is stopped and the buck converter continues to operate to supply system load.

A write to any I<sup>2</sup>C register transitions the charger from default mode to host mode, and initiates the watchdog timer. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD\_RST bit before the watchdog timer expires (WD\_STAT bit is set), or disable watchdog timer by setting WATCHDOG bits = 00.

When the watchdog expires, the device returns to default mode. The ICHG value is divided in half when the watchdog timer expires, and a number of other fields are reset to their POR default values as shown in the notes column of the register tables in [セクション 8.6](#). When watchdog timer expires, WD\_STAT and WD\_FLAG is set to 1, and an  $\overline{INT}$  is asserted low to alert the host (unless masked by WD\_MASK).

図 8-6. Watchdog Timer Flow Chart

### 8.4.2 Register Bit Reset

Beside a register reset by the watchdog timer in default mode, the register and the timer can be reset to the default value by writing the REG\_RST bit to 1. The register bits, which can be reset by the REG\_RST bit, are noted in the [Register Map](#) section. After the register reset, the REG\_RST bit goes back from 1 to 0 automatically.

## 8.5 Programming

### 8.5.1 Serial Interface

The BQ25622E uses an I<sup>2</sup>C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I<sup>2</sup>C is a bi-directional 2-wire serial interface. Only two open-drain bus lines are required: a serial data line (SDA), and a serial clock line (SCL).

The device has 7-bit I<sup>2</sup>C address 0x6B, receiving control inputs from a host device such as a micro-controller or digital signal processor through register addresses 0x02 – 0x38. The host device initiates all transfers and the charger responds. Register reads outside of these addresses return 0xFF. When the bus is free, both SDA and SCL lines are HIGH.

The I<sup>2</sup>C interface supports standard mode (up to 100 kbits/s), fast mode (up to 400 kbits/s) and fast mode plus (up to 1 Mbits/s.) These lines are pulled up to a reference voltage via pull-up resistor. The device I<sup>2</sup>C detection thresholds support a communication reference voltage from 1.2 V to 5 V.

Due to the ultra low I<sub>Q</sub> when the device operates in low power mode, it is necessary ensure a minimum of 128μs between a START command and any subsequent START command on the I<sup>2</sup>C bus. The recommended minimum t<sub>buf</sub> (bus free time between a STOP and START condition) depends on the I<sup>2</sup>C mode:

- Standard mode (100 kbits/s):
  - No additional requirements
- Fast mode (400 kbits/s):
  - Increase I<sup>2</sup>C t<sub>buf</sub> to at least 80 μs
  - If using repeated start commands, ensure I<sup>2</sup>C tsu:STA is at least 80 μs
- Fast mode plus (1 Mbits/s):
  - Increase I<sup>2</sup>C t<sub>buf</sub> to at least 120 μs
  - If using repeated start commands, ensure I<sup>2</sup>C tsu:STA is at least 120 μs

These recommendations assume a successful I<sup>2</sup>C transaction. It is also necessary to ensure a minimum 128μs time between two START commands in the case of a NACK.

#### 8.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

**図 8-7. Bit Transfer on the I<sup>2</sup>C Bus**

#### 8.5.1.2 START and STOP Conditions

All transactions begin with a START (S) and are terminated with a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

### 8.5.1.6 Single Write and Read

8-11. Single Write

8-12. Single Read

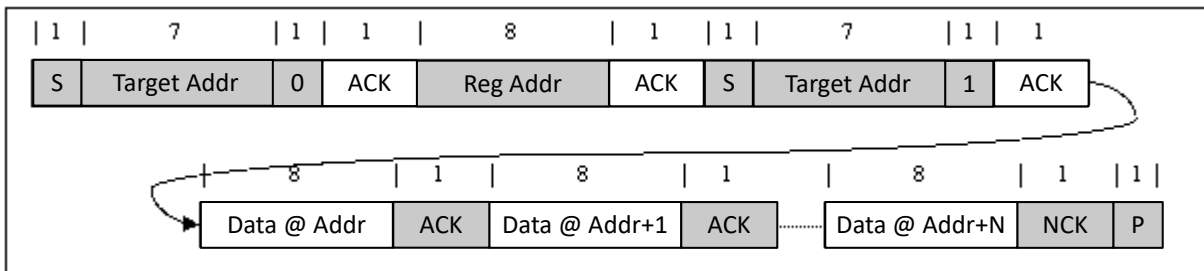

If the register address is not defined, the charger IC sends back NACK and returns to the idle state.

### 8.5.1.7 Multi-Write and Multi-Read

The charger device supports multi-byte read and multi-byte write of all registers. These multi-byte operations are allowed to cross register boundaries. For instance, the entire register map may be read in a single operation with a 39-byte read that starts at register address 0x01.

8-13. Multi-Write

8-14. Multi-Read

## 8.6 Register Maps

I<sup>2</sup>C Device Address: 0x6B.

### 8.6.1 Register Programming

The BQ25622E contains 8-bit and 16-bit registers. When writing to 16-bit registers, I<sup>2</sup>C transactions follow the little endian format, starting at the address of the least significant byte and writing both register bytes in a single 16-bit transaction.

## 8.6.2 BQ25622E Registers

表 8-5 lists the memory-mapped registers for the BQ25622E registers. All register offset addresses not listed in 表 8-5 should be considered as reserved locations and the register contents should not be modified.

## 9 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 9.1 Application Information

A typical application consists of the device configured as an I<sup>2</sup>C controlled power path management device and a single cell battery charger for Li-Ion and Li-polymer batteries used in a wide range of smartphone and other portable devices. It integrates an input reverse-block FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET Q4) between the system and battery. The device also integrates a bootstrap diode for the high-side gate drive.

### 9.2 Typical Application

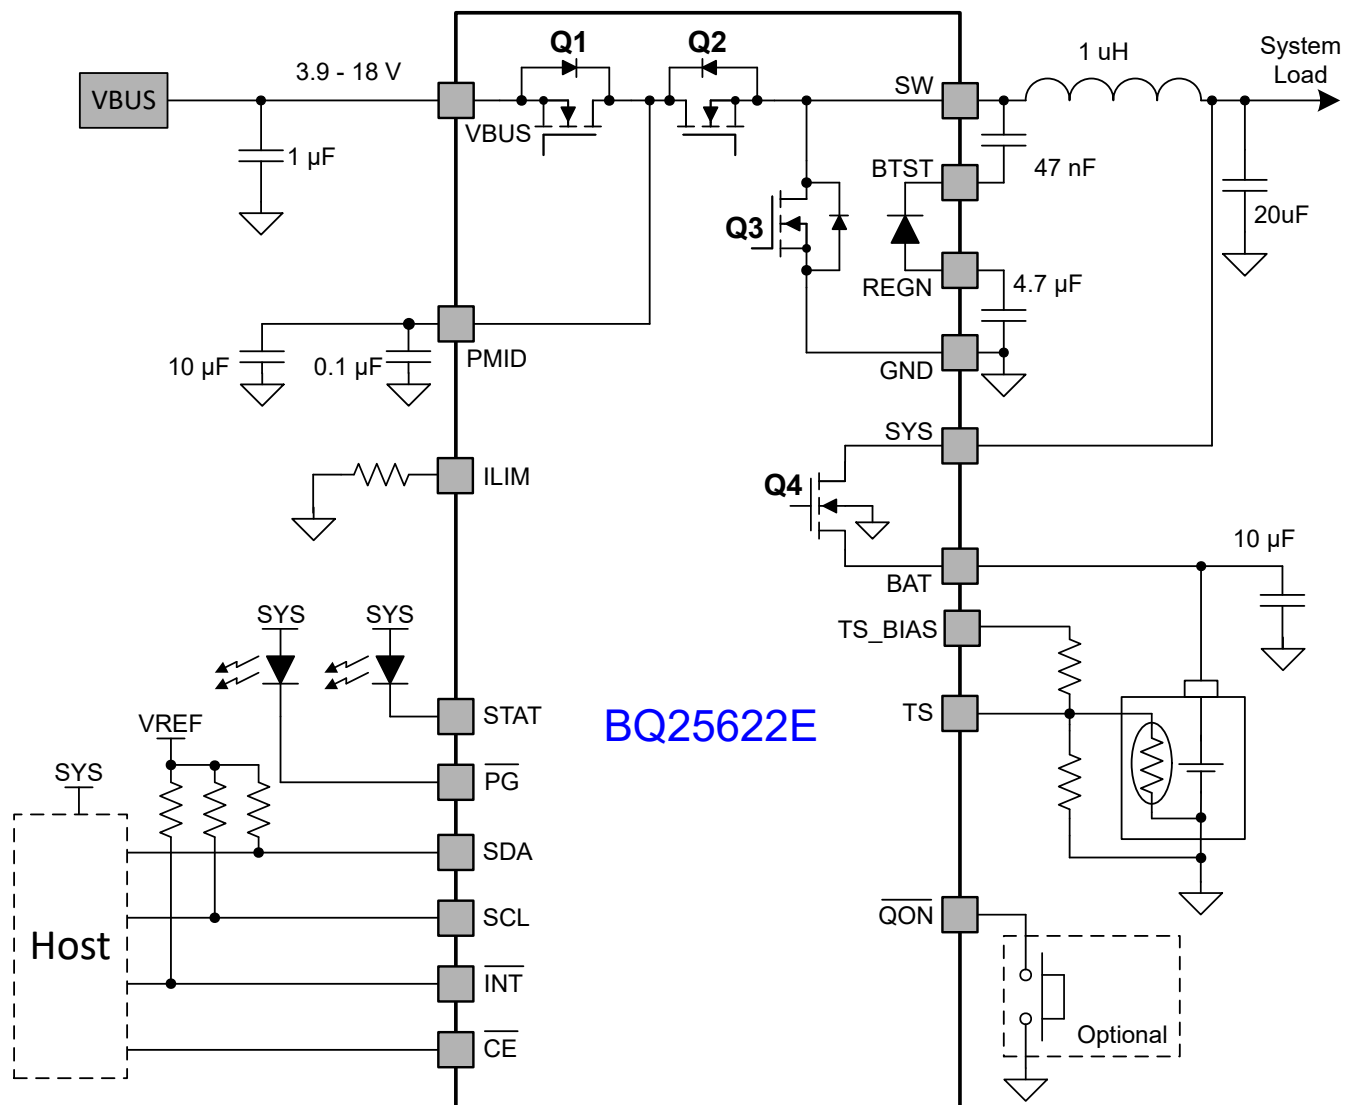

図 9-1. BQ25622E Application Diagram

## 9.2.1 Design Requirements

### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 Inductor Selection

The 1.5-MHz switching frequency allows the use of small inductor and capacitor values to maintain an inductor saturation current higher than the charging current ( $I_{CHG}$ ) plus half the ripple current ( $I_{RIPPLE}$ ):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \quad (3)$$

The inductor ripple current depends on the input voltage ( $V_{VBUS}$ ), the duty cycle ( $D = V_{BAT}/V_{VBUS}$ ), the switching frequency ( $f_S$ ) and the inductance (L).

$$I_{RIPPLE} = \frac{V_{IN} \times D \times (1 - D)}{f_S \times L} \quad (4)$$

The maximum inductor ripple current occurs when the duty cycle (D) is approximately 0.5. Usually inductor ripple is designed between 20% and 40% of the maximum charging current as a trade-off between inductor size and efficiency.

#### 9.2.2.2 Input Capacitor

Design input capacitance to provide enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current  $I_{CIN}$  occurs where the duty cycle is closest to 50% and can be estimated using 式 5.

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (5)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed as close as possible to the drain of the high-side MOSFET (PMID) and source of the low-side MOSFET (GND). Voltage rating of the capacitor must be higher than normal input voltage level. A rating of 25-V or higher capacitor is preferred for 15 V input voltage. 10- $\mu$ F ceramic capacitor is suggested for typical of 3.5A charging current.

#### 9.2.2.3 Output Capacitor

Ensure that the output capacitance has enough ripple current rating to absorb the output switching ripple current. 式 6 shows the output capacitor RMS current  $I_{COUT}$  calculation.

$$I_{COUT} = \frac{I_{RIPPLE}}{2 \times \sqrt{3}} \approx 0.29 \times I_{RIPPLE} \quad (6)$$

The output capacitor voltage ripple can be calculated as follows:

$$\Delta V_{SYS} = \frac{V_{SYS}}{8 \times L \times C_{SYS} \times f_{SW}^2} \left( 1 - \frac{V_{SYS}}{V_{VBUS}} \right) \quad (7)$$

At certain input and output voltage and switching frequency, the voltage ripple can be reduced by increasing the output filter LC.

The charger device has internal loop compensation optimized for  $\geq 10$ - $\mu$ F ceramic output capacitor. The preferred ceramic capacitor is 10-V rating, X7R or X5R.

### 9.2.3 Application Curves

$V_{VBUS} = 5\text{ V}$                        $V_{BAT} = 3.2\text{ V}$   
 $I_{CHG} = 1\text{ A}$

**9-2. Power-Up with Charge Enabled**

$V_{VBUS} = 5\text{ V}$                        $V_{BAT} = 3.2\text{ V}$   
 $I_{CHG} = 1\text{ A}$

**9-3. Power-Down**

$V_{VBUS} = 5\text{ V}$                        $V_{BAT} = 3.2\text{ V}$   
 $I_{CHG} = 1\text{ A}$

**9-4. Charge Enable**

$V_{VBUS} = 5\text{ V}$                        $V_{BAT} = 3.2\text{ V}$   
 $I_{CHG} = 1\text{ A}$

**9-5. Charge Disable**

$V_{BAT} = 3.2\text{ V}$

**9-6. System Reset by QON without VBUS Present**

$V_{VBUS} = 5\text{ V}$                        $V_{BAT} = 3.2\text{ V}$   
 $I_{CHG} = 480\text{mA}$

**9-7. System Reset by QON with VBUS Present**

$V_{VBUS} = 5\text{ V}$   
 $I_{SYS} = 50\text{ mA}$

$V_{BAT} = 3.2\text{ V}$   
Charge Disabled

9-8. PFM Switching in Buck Mode

$V_{VBUS} = 5\text{ V}$   
 $I_{CHG} = 1\text{ A}$

$V_{VBAT} = 3.2\text{ V}$

9-9. PWM Switching in Buck Mode

$V_{VBUS} = 5\text{ V}$   
 $I_{SYS}$  from 0 A to 1 A

$V_{BAT} = 3.2\text{ V}$   
Charge Disabled

9-10. System Load Transient

## 10 Power Supply Recommendations

In order to provide an output voltage on SYS, the device requires a power supply between 3.9 V and 18.0 V input with at least 100-mA current rating connected to VBUS or a single-cell Li-Ion battery with voltage >  $V_{BATUVLO}$  connected to BAT.

## 11 Layout

### 11.1 Layout Guidelines

The switching node rise and fall times should be minimized for lowest switching loss. Proper layout of the components to minimize high frequency current path loop (see [Figure 11-1](#)) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Follow this specific order carefully to achieve the proper layout.

1. For lowest switching noise during forward/charge mode, place the decoupling capacitor CPMID1 and then bulk capacitor CPMID2 positive terminals as close as possible to PMID pin. Place the capacitor ground terminal close to the GND pin using the shortest copper trace connection or GND plane on the same layer as the IC. See [Figure 11-2](#).
2. For lowest switching noise during reverse/OTG mode, place the CSYS1 and CSYS2 output capacitors' positive terminals near the SYS pin. The capacitors' ground terminals must be via'd down through multiple vias to an all ground internal layer that returns to IC GND pin through multiple vias under the IC. See [Figure 11-2](#).
3. Since REGN powers the internal gate drivers, place the CREGN capacitor positive terminal close to REGN pin to minimize switching noise. The capacitor's ground terminal must be via'd down through multiple vias to an all ground internal layer that returns to IC GND pin through multiple vias under the IC. See [Figure 11-2](#).
4. Place the CVBUS and CBAT capacitors positive terminals as close to the VBUS and BAT pins as possible. The capacitors' ground terminals must be via'd down through multiple vias to an all ground internal layer that returns to IC GND pin through multiple vias under the IC. See [Figure 11-2](#).
5. Place the inductor input pin near the positive terminal of the SYS pin capacitors. Due to the PMID capacitor placement requirements, the inductor's switching node terminal must be via'd down with multiple vias to a second internal layer with a wide trace that returns to the SW pin with multiple vias. See [Figure 11-3](#). Using multiple vias ensures that the via's additional resistance is negligible compared to the inductor's dc resistance and therefore does not impact efficiency. The vias additional series inductance is negligible compared to the inductor's inductance.
6. Place the BTST capacitor on the opposite side from the IC using vias to connect to the BTST pin and SW node. See [Figure 11-4](#).
7. A separate analog GND plane for non-power related resistors and capacitors is not required if those components are placed away from the power components traces and planes.
8. Ensure that the I2C SDA and SCL lines are routed away from the SW node.

Additionally, it is important that the PCB footprint and solder mask for the BQ25622E cover the entire length of each of the pins. GND, SW, PMID, SYS and BAT pins extend further into the package than the other pins. Using the entire length of these pins reduces parasitic resistance and increases thermal conductivity from the package into the board.

### 11.2 Layout Example

**Figure 11-1. High Frequency Current Path**

図 11-2. Layout Example: Top Layer (red) and All PGND Internal Layer 2 (brown)

図 11-3. Layout Example: Inner Layer 3 (AGND pour; SW node pour; signal routing)

図 11-4. Layout Example: Bottom Layer X-Ray From Top (PGND pour; BTST capacitor; redundant SW, SYS and BAT pours)

## 12 Device and Documentation Support

### 12.1 Device Support

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ25622ERYKR	ACTIVE	WQFN-HR	RYK	18	3000	RoHS & Green	SN	Level-2-260C-1 YEAR	-40 to 85	BQ622E	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
BQ25622ERYKR	WQFN-HR	RYK	18	3000	180.0	12.4	2.8	3.3	1.1	4.0	12.0	Q2

**TAPE AND REEL BOX DIMENSIONS**

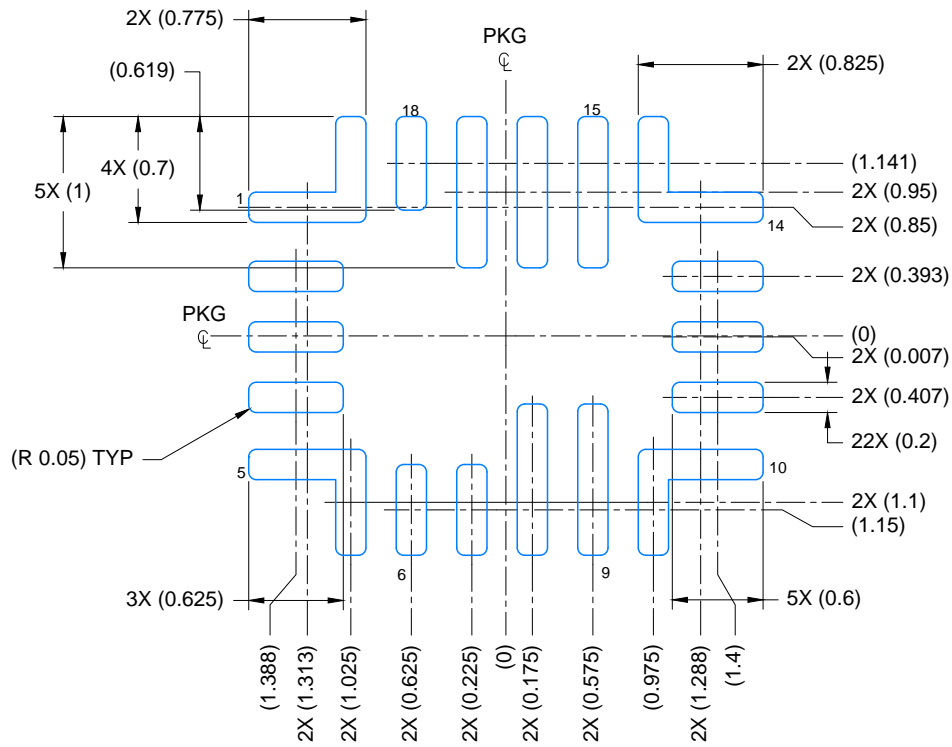

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
BQ25622ERYKR	WQFN-HR	RYK	18	3000	210.0	185.0	35.0

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

**LAND PATTERN EXAMPLE**  
EXPOSED METAL SHOWN  
SCALE: 20X

**SOLDER MASK DETAILS**

4226526/A 02/2021

NOTES: (continued)

3. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)) .
4. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

**SOLDER PASTE EXAMPLE**  
 BASED ON 0.100 mm THICK STENCIL  
 SCALE: 20X

4226526/A 02/2021

NOTES: (continued)

- 5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## 重要なお知らせと免責事項

TI は、技術データと信頼性データ(データシートを含みます)、設計リソース(リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。
