

DACx0504 クワッド、16/14/12 ビット、内部リファレンス電圧搭載の SPI 電圧出力 DAC

1 特長

- 性能
 - INL: 16ビット分解能で最大値 ± 1 LSB
 - TUE: FSR最大値の $\pm 0.1\%$
- 2.5Vの高精度内部基準電圧を搭載
 - 初期精度: ± 5 mV (最大値)
 - 低ドリフト: 2ppm/ $^{\circ}$ C (標準値)
- 高い駆動能力: 電源レールから0.5Vで20mA
- 柔軟な出力構成
 - ユーザーがゲインを選択可能: 2、1、 $\frac{1}{2}$
 - ゼロ・スケールまたは中間スケールにリセット
- 広い動作範囲
 - 電源: 2.7V \sim 5.5V
 - 温度: -40° C \sim 125 $^{\circ}$ C
- 50MHz、SPI互換のシリアル・インターフェイス
 - 4線式モード、1.7V \sim 5.5V動作
 - デジタイズ・チェーン動作
 - CRCエラー・チェック
- 低消費電力: 5.5Vで0.7mA/チャンネル
- 小型のパッケージ: 3mm \times 3mm、16ピンのWQFN

2 アプリケーション

- 光学ネットワーク機器
- ワイヤレス・インフラ
- 産業用オートメーション
- データ収集システム

3 概要

DAC80504、DAC70504、DAC60504 (DACx0504) は、16、14、12ビット分解能の低消費電力、4チャンネル、バッファ付き電圧出力のデジタル/アナログ・コンバータ (DAC) のピン互換ファミリです。DACx0504には、低ドリフト、2.5Vの内部基準電圧が搭載されており、ほとんどのアプリケーションでは外付けの高精度基準電圧が不要になります。ユーザーがゲイン構成を選択可能で、フルスケールの出力電圧は 1.25V (ゲイン = $\frac{1}{2}$)、2.5V (ゲイン = 1)、または 5V (ゲイン = 2) です。これらのデバイスは 2.7V \sim 5.5Vの単電源で動作し、単調性が規定されており、 ± 1 LSB INL の高い線形性を実現します。

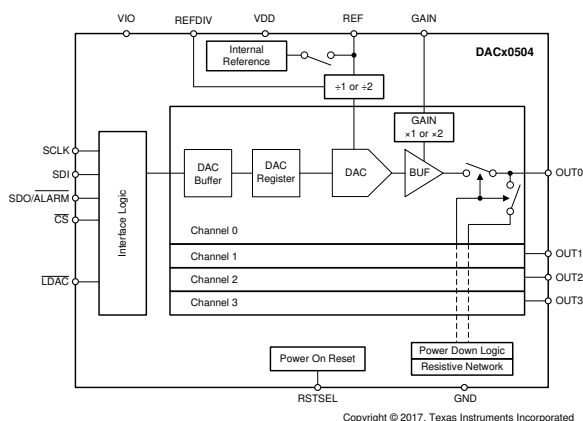

DACx0504との通信は、4線式のシリアル・インターフェイスで行われ、最大50MHzのクロック速度で動作します。VIOピンにより、1.7V \sim 5.5Vのシリアル・インターフェイス動作が可能です。DACx0504の柔軟なインターフェイスにより、広い範囲の業界標準マイクロプロセッサやマイクロコントローラと動作可能です。

4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Revision B (September 2018) から Revision C に変更	Page
データシートに DAC60504 デバイスを追加	4
Changed TUE values for DAC70504 in Electrical Characteristics	8
Changed Full-scale error values for DAC70504 in Electrical Characteristics	8
Changed Gain error values for DAC70504 in Electrical Characteristics	8
Changed channel-to-channel dc crosstalk values for DAC70504 in Electrical Characteristics	9
Changed reference output drift values for DAC70504 in Electrical Characteristics	10
Changed reference thermal hysteresis values for DAC70504 in Electrical Characteristics	10
Deleted Figure 58, DAC70504 Solder Heat Reflow Reference Voltage Shift	24
Changed reset value for VERSIONID from 10 to 11 in Table 10, DEVICE ID Field Descriptions	32

Revision A (December 2017) から Revision B に変更	Page
「製品情報」からDAC80504の製品プレビューを削除	1
「特長」の TUE を±0.14% から±0.1% に変更	4
DAC80504 を追加、「特長」の低ドリフトを 5ppm/°Cから 2ppm/°Cに変更	4
Deleted Product Preview for DAC80504 from <i>Device Comparison Table</i>	5
Added Added TUE DAC80504. All Gains row in Electrical Characteristics	8
Added Added Full-scale error DAC80504. All Gains row in Electrical Characteristics	8
Added Added Gain error DAC80504. All Gains row in Electrical Characteristics	8
Changed Short circuit current, DAC code = full scale, output shorted to GND in Electrical Characteristics TYP from 35 mA to 30 mA	9
Changed Short circuit current, DAC code = zero scale, output shorted to V _{DD} in Electrical Characteristics TYP from 30 mA to 35 mA	9
Added Channel-to channel dc crosstalk, Measured channel at midscale. Adjacent channel at full scale. DAC80504 in Electrical Characteristics	9

• Added Channel-to-channel crosstalk, Measured channel at midscale. All other channels at full scale. DAC80504 in Electrical Characteristics	9
• Added Added Reference output drift, DAC80504 in Electrical Characteristics	10
• Added Reference thermal hysteresis, DAC80504. First cycle in Electrical Characteristics	10
• Changed some graphs in Typical Characteristics	11
• Added Figure 59, Solder Heat Reflow Reference Voltage Shift.....	24
• Added t_{LDACS} and t_{LDACH} to Table 7	29
• Added 010 (12-bit) to D14:12 Description in Table 10	32

5 概要（続き）

DACx0504 にはパワー・オン・リセット回路が組み込まれており、DAC をパワー・オンしてから、デバイスへ有効なコードが書き込まれるまで DAC 出力をゼロ・スケールまたは中間スケールに維持します。これらのデバイスの消費電流は 5.5V 時に 0.7mA/チャンネルと低いため、バッテリー動作の機器に適した選択肢です。チャンネルごとのパワーダウン機能により、デバイスの消費電流は 15 μ A に低下します。

DACx0504 は -40 $^{\circ}$ C \sim +125 $^{\circ}$ C の温度範囲で動作が規定されており、小型の 3mm \times 3mm QFN パッケージで供給されます。

6 Device Comparison Table

DEVICE	RESOLUTION	REFERENCE
DAC80504	16-Bit	Internal (default) or External
DAC70504	14-Bit	Internal (default) or External
DAC60504	12-Bit	Internal (default) or External

7 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
REF	1	I/O	When using internal reference, this is the reference output voltage pin (default). When using an external reference, this is the reference input pin to the device.
OUT0	2	O	Analog output voltage from DAC 0.
OUT1	3	O	Analog output voltage from DAC 1.
OUT2	4	O	Analog output voltage from DAC 2.
OUT3	5	O	Analog output voltage from DAC 3.
GND	6	GND	Ground reference point for all circuitry on the device.
VDD	7	PWR	Analog supply voltage (2.7 V to 5.5 V).
GAIN	8	I	Sets the gain configuration after a power-up or reset event. When tied to GND, the initial buffer amplifier gain for all four channels is set to 1. When tied to V_{IO} the initial buffer amplifier gain is 2. Changing the state of this pin after power-up does not affect the device operation.
RSTSEL	9	I	Reset select pin. When tied to GND all four DACs reset to zero scale. When connected to V_{IO} all four DACs reset to midscale.
REFDIV	10	I	Sets the reference divider configuration after a power-up or reset event. When tied to GND, the reference voltage is not divided down. When tied to V_{IO} the reference voltage is divided by 2. Changing the state of this pin after power-up does not affect the device operation.
$\overline{\text{LDAC}}$	11	I	A high-to-low transition on the $\overline{\text{LDAC}}$ pin causes the DAC outputs of those channels configured in synchronous mode to update simultaneously. The pin can be tied permanently to GND.
$\overline{\text{CS}}$	12	I	Active low serial data enable. This input is the frame synchronization signal for the serial data. When the signal goes low, it enables the serial interface input shift register.
SCLK	13	I	Serial interface clock.
SDI	14	I	Serial interface data input. Data are clocked into the input shift register on each falling edge of the SCLK pin.
$\overline{\text{SDO/ALARM}}$	15	O	Serial interface data output (default). The SDO pin is in high impedance when $\overline{\text{CS}}$ pin is high. Data are clocked out of the input shift register on either rising or falling edges of the SCLK pin as specified by the FSDO bit. Alternatively the pin can be configured as an $\overline{\text{ALARM}}$ open-drain output to indicate a CRC or reference alarm event. If configured as $\overline{\text{ALARM}}$ a 10 k Ω , pull-up resistor to V_{IO} is required.
VIO	16	PWR	IO supply voltage (1.7 V to 5.5 V). This pin sets the I/O operating voltage for the serial interface.
Thermal Pad	–	–	The thermal pad is located on the bottom-side of the QFN package. The thermal pad should be connected to any internal PCB ground plane using multiple vias for good thermal performance.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	V _{DD} to GND	-0.3	6	V
	V _{IO} to GND	-0.3	6	
Pin voltage	DAC outputs to GND	-0.3	V _{DD} + 0.3	V
	REF to GND	-0.3	V _{DD} + 0.3	
	Digital pins to GND	-0.3	V _{IO} + 0.3	
Input current	Input current to any pin except supply pins	-10	10	mA
Temperature	Operating free-air, T _A	-40	125	°C
	Junction, T _J	-40	150	
	Storage, T _{stg}	-60	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

8.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±3000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
POWER SUPPLY					
V _{DD}	Analog supply voltage	2.7		5.5	V
V _{IO}	IO supply voltage	1.7		5.5	
DIGITAL INPUTS					
	Digital input voltage	0		V _{IO}	V
REFERENCE INPUT					
V _{REFIN}	V _{DD} = 2.7 V to 3.3 V	Reference divider disabled	1.2	(V _{DD} - 0.2)/2	V
		Reference divider enabled	2.4	V _{DD} - 0.2	
	V _{DD} = 3.3 V to 5.5 V	Reference divider disabled	1.2	V _{DD} /2	
		Reference divider enabled	2.4	V _{DD}	
TEMPERATURE					
T _A	Operating free-air temperature	-40		125	°C

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DACx0504	UNIT
		RTE (WQFN)	
		16 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	33.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	29.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	7.3	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter	7.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.9	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

8.5 Electrical Characteristics

all minimum and maximum specifications at V_{DD} = 2.7 V to 5.5 V, V_{IO} = 1.7 V to 5.5 V, V_{REFIN} = 1.25 V to 5.5 V, R_{LOAD} = 2 kΩ to GND, C_{LOAD} = 200 pF to GND, digital inputs at V_{IO} or GND, and T_A = -40°C to +125°C (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE⁽¹⁾					
Resolution	DAC80504	16			Bits
	DAC70504	14			
	DAC60504	12			
INL Integral nonlinearity	DAC80504		±0.5	±1	LSB
	DAC70504		±0.5	±1	
	DAC60504		±0.5	±1	
DNL Differential nonlinearity	DAC80504, specified 16-bit monotonic		±0.5	±1	LSB
	DAC70504, specified 14-bit monotonic		±0.5	±1	
	DAC60504, specified 12-bit monotonic		±0.5	±1	
TUE Total unadjusted error			±0.05	±0.1	%FSR
Offset error			±0.75	±1.5	mV
Zero-code error	DAC code = zero scale		0.5	1.5	mV
Full-scale error			±0.05	±0.1	%FSR
Gain error			±0.05	±0.1	%FSR
Offset error drift			±1		μV/°C
Zero-code error drift			±2		μV/°C
Full-scale error drift			±2		ppm of FSR/°C
Gain error drift			±1		ppm of FSR/°C
Output voltage drift over time	T _A = 25°C, DAC code = midscale, 1600 hours		20		ppm of FSR

(1) Static performance specified with DAC outputs unloaded for all gain options, unless otherwise noted. End point fit between codes. 16-bit: Code 256 to 65280, 14-bit: Code 128 to 16127, 12-bit: Code 16 to 4031.

Electrical Characteristics (continued)

all minimum and maximum specifications at $V_{DD} = 2.7\text{ V to }5.5\text{ V}$, $V_{IO} = 1.7\text{ V to }5.5\text{ V}$, $V_{REFIN} = 1.25\text{ V to }5.5\text{ V}$, $R_{LOAD} = 2\text{ k}\Omega$ to GND, $C_{LOAD} = 200\text{ pF to GND}$, digital inputs at V_{IO} or GND, and $T_A = -40^\circ\text{C to }+125^\circ\text{C}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT CHARACTERISTICS					
Voltage range	Gain = 2 (BUFF-GAIN = 1, REF-DIV = 0)	0		$2 \times V_{REF}$	V
	Gain = 1 (BUFF-GAIN = 1, REF-DIV = 1)	0		V_{REF}	
	Gain = $\frac{1}{2}$ (BUFF-GAIN = 0, REF-DIV = 1)	0		$\frac{1}{2} \times V_{REF}$	
Output voltage headroom	to GND or V_{DD} (unloaded)		0.004		V
	to GND or V_{DD} ($-5\text{ mA} \leq I_{OUT} \leq 5\text{ mA}$)	0.15

DC output impedance	DAC code = midscale		0.085		Ω
	DAC code at GND or V_{DD}		15		
DYNAMIC PERFORMANCE					
Output voltage settling time	$\frac{1}{4}$ to $\frac{3}{4}$ scale and $\frac{3}{4}$ to $\frac{1}{4}$ scale settling time to ± 2 LSB, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2		5		μs
Slew rate	$V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2		1.8		$\text{V}/\mu\text{s}$
Power-up time	DACx-PWDWN 1 to 0 transition, DAC code = full scale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2 ⁽⁴⁾		12		μs
Power-up glitch magnitude	DAC code = zero scale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2, $C_{LOAD} = 50\text{ pF}$		25		mV
Output noise	0.1 Hz to 10 Hz, DAC code = midscale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2		14		μV_{PP}
Output noise density	1 kHz, DAC code = midscale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2		78		$\text{nV}/\sqrt{\text{Hz}}$
	10 kHz, DAC code = midscale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 2		74		
	1 kHz, DAC code = full scale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 1		55		
	10 kHz, DAC code = full scale, $V_{DD} = 5.5\text{ V}$, $V_{REFIN} = 2.5\text{ V}$, gain = 1		50		
AC PSRR	DAC code = midscale, frequency = 60 Hz, amplitude = 200 mV _{PP} superimposed on V_{DD}		85		dB
DC PSRR	DAC code = midscale, $V_{DD} = 5\text{ V} \pm 10\%$		10		$\mu\text{V}/\text{V}$
Code change glitch impulse	1 LSB change around major carrier		4		nV-s
Channel-to-channel ac crosstalk	DAC code = midscale. Code 32 to full-scale swing on adjacent channel		0.2		nV-s
Channel-to-channel dc crosstalk	Measured channel at midscale, adjacent channel at full scale		5		μV
	Measured channel at midscale, all other channels at full scale		10		
Digital feedthrough	DAC code = midscale. $f_{SCLK} = 1\text{ MHz}$, SDO disabled		0.1		nV-s
EXTERNAL REFERENCE INPUT					
Reference input current	$V_{REFIN} = 2.5\text{ V}$		25		μA
Reference input impedance			100		k Ω
Reference input capacitance			5		pF

- (2) Temporary overload condition protection. Junction temperature can be exceeded during current limit. Operation above the specified maximum junction temperature may impair device reliability.
- (3) Specified by design and characterization. Not tested during production.
- (4) Time to exit DAC power-down mode. Measured from \overline{CS} rising edge to 90% of DAC final value.

Electrical Characteristics (continued)

all minimum and maximum specifications at $V_{DD} = 2.7\text{ V to }5.5\text{ V}$, $V_{IO} = 1.7\text{ V to }5.5\text{ V}$, $V_{REFIN} = 1.25\text{ V to }5.5\text{ V}$, $R_{LOAD} = 2\text{ k}\Omega$ to GND, $C_{LOAD} = 200\text{ pF to GND}$, digital inputs at V_{IO} or GND, and $T_A = -40^\circ\text{C to }+125^\circ\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

9 Detailed Description

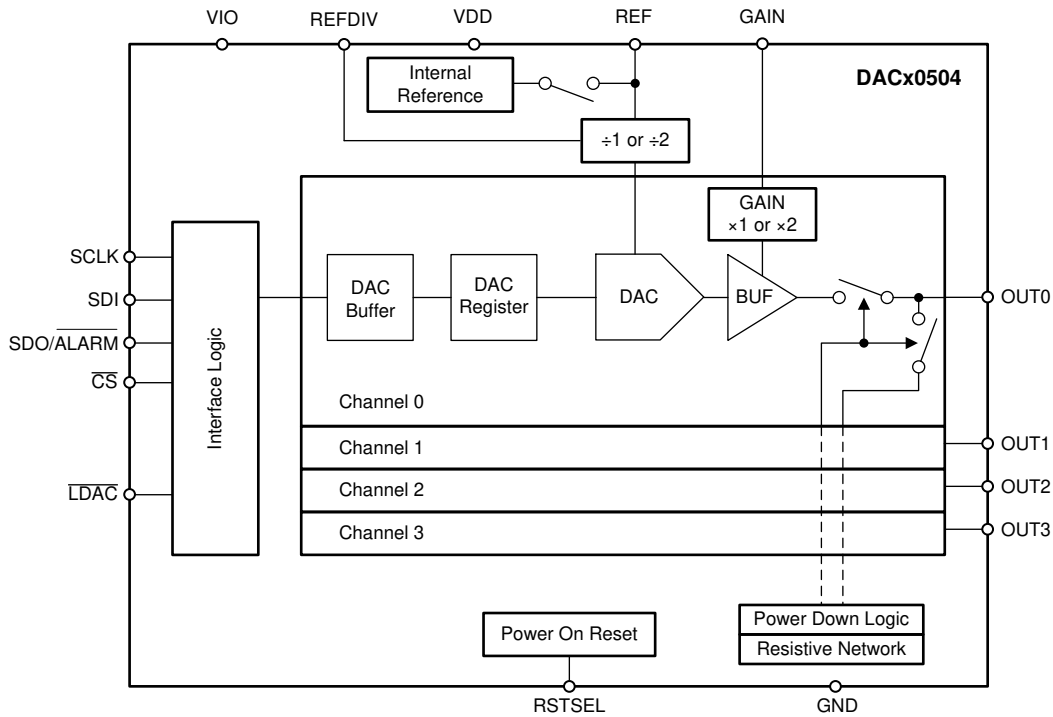

9.1 Overview

The DACx0504 is a pin-compatible family of low-power, four-channel, buffered voltage-output digital-to-analog converters (DACs) with 16-, 14-, and 12-bit resolution. The DACx0504 include a 2.5-V internal reference and user-selectable gain configuration, providing full-scale output voltages of 1.25 V (gain = 1/2), 2.5 V (gain = 1), or 5 V (gain = 2). The device operates from a single 2.7 V to 5.5 V supply, is specified monotonic, and provides high linearity of ± 1 LSB INL.

Communication to the DACx0504 is performed through a 4-wire serial interface that supports stand-alone and daisy-chain operation. The optional frame-error checking provides added robustness to the DACx0504 serial interface.

The DACx0504 incorporates a power-on-reset circuit and RSTSEL pin that powers up and maintains the DAC outputs at either zero scale or midscale until a valid code is written to the device.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Digital-to-Analog Converter (DAC)

Each output channel in the DACx0504 consists of an R-2R ladder architecture followed by an output buffer amplifier. Figure 57 shows a block diagram of the DAC architecture.

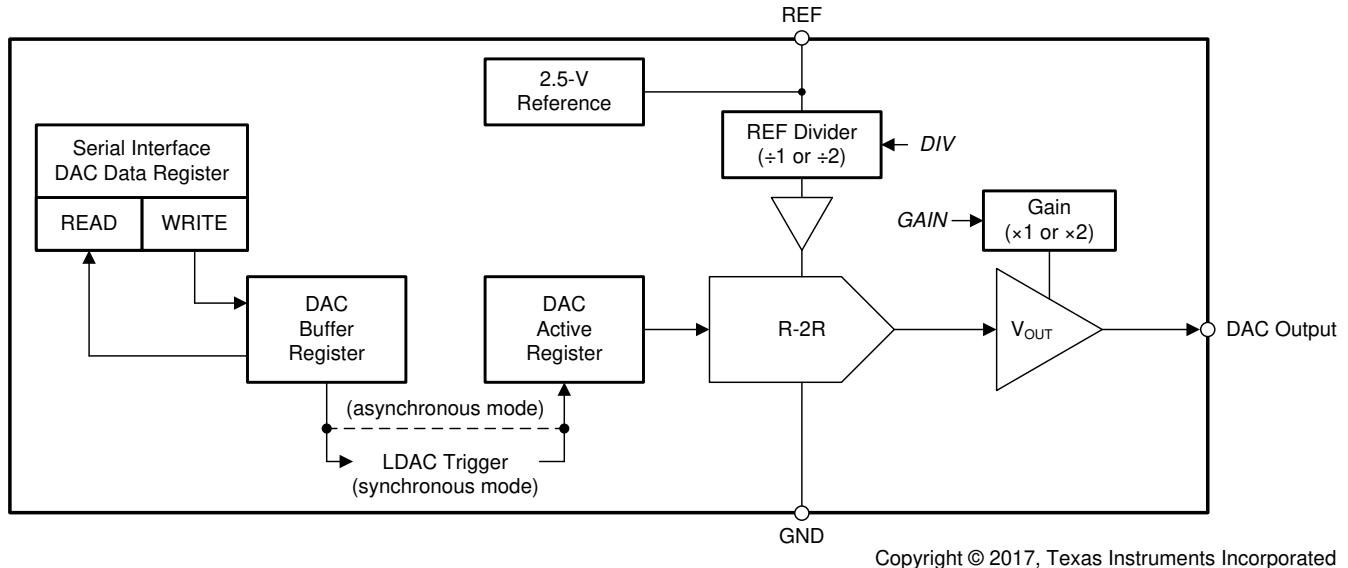

Figure 57. DACx0504 DAC Block Diagram

9.3.1.1 DAC Transfer Function

The input data are written to the individual DAC data registers in straight binary format. After a power-on or a reset event, all DAC registers are set to either zero code or midscale code, as determined by the RSTSEL pin. The DAC transfer function is given by Equation 1.

$$V_{OUT} = \frac{CODE}{2^n} \times \frac{V_{REF}}{DIV} \times GAIN$$

where

- CODE = decimal equivalent of the binary code that is loaded to the DAC register. CODE ranges from 0 to $2^n - 1$.
- V_{REF} = DAC reference voltage. Either V_{REFOUT} from the internal 2.5 V reference or V_{REFIN} if using an external one.
- n = resolution in bits. Either 16 (DAC80504), 14 (DAC70504), or 12 (DAC60504).
- DIV = 1 or 2 as set by the REFDIV pin after a reset event or by the REF-DIV bit in the GAIN register.
- GAIN = 1 or 2 as set by the GAIN pin after a reset event or by the BUFF-GAIN bit for that DAC channel in the GAIN register. (1)

Feature Description (continued)

9.3.1.2 Output Amplifiers

The DACx0504 output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving a maximum output range of 0 V to V_{DD} . Each buffer amplifier is capable of driving a load of 2 k Ω in parallel with 10 nF to GND.

The full-scale output voltage for each channel is determined by the reference voltage (V_{REF}), the reference divider setting (DIV), and the output buffer gain for that channel (GAIN), as shown in [Table 1](#). After a power-up or reset event the DIV and GAIN settings are set by the REFDIV and GAIN pins, respectively. During normal operation the DIV and GAIN settings can be reconfigured through the REF-DIV and BUFF-GAIN bit (see [Equation 1](#)). The GAIN setting for each output channel can be individually configured thus enabling independent output voltage ranges for each DAC output.

Table 1. DAC Output Range Configuration

DIV SETTING	GAIN SETTING	DAC OUTPUT RANGE
$\div 2$	$\times 1$	0 V to $\frac{1}{2} \times V_{REF}$
$\div 1$	$\times 1$	Not recommended
$\div 2$	$\times 2$	0 V to V_{REF}
$\div 1$	$\times 2$	0 V to $2 \times V_{REF}$

9.3.1.3 DAC Register Structure

Data written to the DAC data registers is initially stored in the DAC buffer registers. Transfer of data from the DAC buffer registers to the active DAC registers can be configured to happen immediately (asynchronous mode) or initiated by an LDAC trigger (synchronous mode). Once the DAC active registers are updated, the DAC outputs change to their new values. When the host reads from a DAC Data register, the value held in the DAC buffer register is returned (not the value held in the DAC active register).

9.3.1.3.1 DAC Register Synchronous and Asynchronous Updates

The update mode for each DAC channel is determined by the status of its corresponding SYNC-EN bit. In asynchronous mode, a write to the DAC data register results in an immediate update of the DAC active register and DAC output on \overline{CS} rising edge. In synchronous mode, writing to the DAC data register does not automatically update the DAC output. Instead the update occurs only after an LDAC trigger event. An LDAC trigger is generated either through the LDAC bit in the TRIGGER register or by the LDAC pin. The synchronous update mode enables simultaneous update of multiple DAC outputs. In both update modes a minimum wait time of 1 μ s is required between DAC output updates.

9.3.1.3.2 Broadcast DAC Register

The DAC broadcast register enables a simultaneous update of multiple DAC outputs with the same value with a single register write. Each DAC channel can be configured to update or remain unaffected by a broadcast command by setting the corresponding DAC-BROADCAST-EN bit in the SYNC register. A register write to the BROADCAST-DATA register forces those DAC channels that have been configured for broadcast operation to update their outputs. The DAC outputs update to the broadcast value on \overline{CS} rising edge independently of their synchronous mode configuration.

9.3.2 Internal Reference

The DACx0504 includes a 2.5 V precision bandgap reference enabled by default. Operation from an external reference is supported by disabling the internal reference in the CONFIG register. The internal reference is externally available at the REF pin.

A minimum 150 nF capacitor is recommended between the reference output and GND for noise filtering.

9.3.2.1 Reference Divider

The reference voltage to the device, either from the internal reference or an external one can be divided by a factor of two by tying the REFDIV pin high at power-up or by setting the REF-DIV bit in the GAIN register to 1 during normal operation. The reference voltage divider provides additional flexibility in setting the full-scale output voltage for each DAC output and must be configured to make certain that there is sufficient headroom from V_{DD} to the DAC operating reference voltage ($V_{REF/DIV}$). See the [Recommended Operating Conditions](#) table for more information.

Improper configuration of the reference divider issues a reference alarm condition. In this case, the reference buffer is shut down, and all the DAC outputs go to 0 V. The DAC data registers are unaffected by the alarm condition thus enabling the DAC output to return to normal operation once the reference divider is configured correctly. The reference alarm status can be read from the REF-ALM bit in the STATUS register. Additionally by setting ALM-EN = 1 and ALM-SEL = 1 in the CONFIG register, the SDO/ALARM pin is configured as a reference alarm pin.

9.3.2.2 Solder Heat Reflow

A known behavior of IC reference voltage circuits is the shift induced by the soldering process. [Figure 58](#) shows the effect of solder heat reflow for the DACx0504 internal reference.

Figure 58. Solder Heat Reflow Reference Voltage Shift

9.3.3 Device Reset Options

9.3.3.1 Power-on-Reset (POR)

The DACx0504 includes a power-on reset function that controls the output voltage at power up. After the V_{DD} and V_{IO} supplies have been established a POR event is issued. The POR causes all registers to initialize to their default values and communication with the device is valid only after a 250 μ s power-on-reset delay. The default value for all DACs is either zero-code or midscale-code as determined by the RSTSEL pin. Each DAC channel remains at the power-up voltage until a valid command is written to it.

The POR circuit requires specific supply levels to discharge the internal capacitors and to reset the device on power up, as indicated in Figure 59 and Figure 60. In order to initiate a POR event, V_{DD} or V_{IO} must be below their corresponding low thresholds for at least 100 μ s. If V_{DD} and V_{IO} remain above their specified high threshold a POR event will not occur. When the supplies drop below their high threshold but remain over the lower one (shown as the undefined region), the device may or may not reset under all specified temperature and power-supply conditions.

Figure 59. Threshold Levels for V_{DD} POR Circuit

Figure 60. Threshold Levels for V_{IO} POR Circuit

9.3.3.2 Software Reset

A device software reset event is initiated by writing the reserved code 0x1010 to SOFT-RESET in the TRIGGER register. The software reset command is triggered on the \overline{CS} rising edge of the instruction. A software reset initiates a POR event.

9.4 Device Functional Modes

9.4.1 Stand-Alone Operation

A serial interface access cycle is initiated by asserting the \overline{CS} pin low. The serial clock SCLK can be a continuous or gated clock. SDI data are clocked on SCLK falling edges. A regular serial interface access cycle is 24 bits long with error checking disabled and 32 bits long with error checking enabled, thus the \overline{CS} pin must stay low for at least 24 or 32 SCLK falling edges. The access cycle ends when the \overline{CS} pin is de-asserted high. If the access cycle contains less than the minimum clock edges, the communication is ignored. If the access cycle contains more than the minimum clock edges are present, only the last 24 or 32 bits are used by the device. When CS is high, the SCLK and SDI signals are blocked and the SDO pin is in a Hi-Z state.

In an error checking disabled access cycle (24-bits long) the first byte input to SDI is the instruction cycle which identifies the request as a read or write command and the 4-bit address to be accessed. The following bits in the cycle form the data cycle, as shown in [Table 2](#).

Table 2. Serial Interface Access Cycle

BIT	FIELD	DESCRIPTION
23	RW	Identifies the communication as a read or write command to the addressed register. R/W = 0 sets a write operation. R/W = 1 sets a read operation.
22:20	Reserved	Reserved bits. Must be filled with zeros.
19:16	A[3:0]	Register address. Specifies the register to be accessed during the read or write operation.
15:0	DI[15:0]	Data cycle bits. If a write command, the data cycle bits are the values to be written to the register with address A[3:0]. If a read command, the data cycle bits are don't care values.

A read operation is initiated by issuing a read command access cycle. After the read command, a second access cycle must be issued to get the requested data, as shown in [Table 3](#). Data are clocked out on SDO pin either on the falling edge or rising edge of SCLK according to the FSDO bit in the CONFIG register.

Table 3. SDO Output Access Cycle

BIT	FIELD	DESCRIPTION
23	RW	Echo RW from previous access cycle.
22:20	Reserved	Echo bits 22:20 from previous access cycle (all zeros).
19:16	A[3:0]	Echo address from previous access cycle.
15:0	DO[15:0]	Readback data requested on previous access cycle.

9.4.2 Daisy-Chain Operation

For systems that contain more than one DACx0504 devices, the SDO pin can be used to daisy-chain them together. Daisy-chain operation is useful in reducing the number of serial interface lines.

The first falling edge on the \overline{CS} pin starts the operation cycle. If more than 24 SCLK pulses are applied while the \overline{CS} pin is kept low, the data ripples out of the shift register and is clocked out on the SDO pin either on the falling edge or rising edge of SCLK according to the FSDO bit. By connecting the SDO output of the first device in the chain, a multiple-device interface is constructed. Each device in the system requires 24 clock pulses. As a result the total number of clock cycles must be equal to $24 \times N$, where N is the total number of DACx0504 devices in the daisy chain. When the serial transfer to all devices is complete the \overline{CS} signal is taken high. This action transfers the data from the serial peripheral interface (SPI) shift registers to the internal registers of each device in the daisy chain and prevents any further data from being clocked into the input shift register.

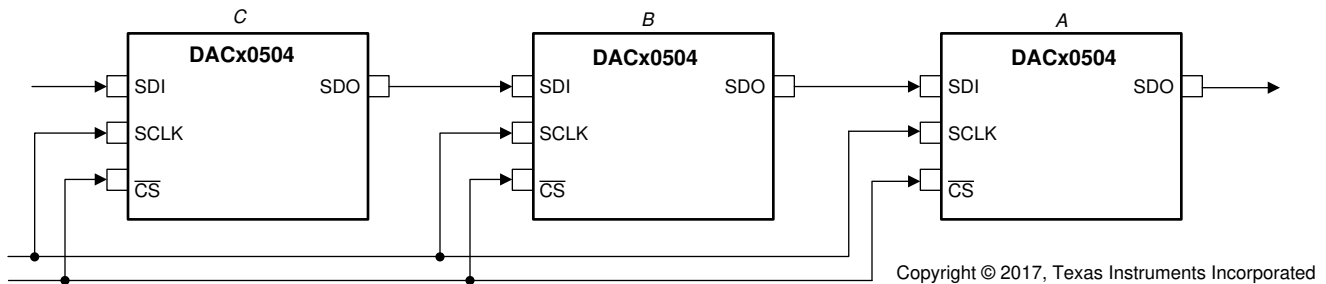

Figure 61. Daisy-Chain Layout

9.4.3 Frame Error Checking

If the DACx0504 is used in a noisy environment, error checking can be used to check the integrity of SPI data communication between the device and the host processor. This feature can be enabled by setting the CRC-EN bit in the CONFIG register.

The error checking scheme is based on the CRC-8-ATM (HEC) polynomial $x^8 + x^2 + x + 1$ (that is, 100000111). When error checking is enabled, the serial interface access cycle width is 32 bits. The normal 24-bit SPI data are appended with an 8-bit CRC polynomial by the host processor before feeding it to the device, as shown in Table 4. In all serial interface readback operations the CRC polynomial is output on the SDO pin as part of the 32-bit cycle.

Table 4. Error Checking Serial Interface Access Cycle

BIT	FIELD	DESCRIPTION
31	RW	Identifies the communication as a read or write command to the addressed register. R/W = 0 sets a write operation. R/W = 1 sets a read operation.
30	CRC-ERROR	Reserved bit. Set to zero.
29:28	Reserved	Reserved bits. Must be filled with zeros.
27:24	A[3:0]	Register address. Specifies the register to be accessed during the read or write operation.
23:8	DI[15:0]	Data cycle bits. If a write command, the data cycle bits are the values to be written to the register with address A[3:0]. If a read command, the data cycle bits are don't care values.
7:0	CRC	8-bit CRC polynomial.

The DACx0504 decodes the 32-bit access cycle to compute the CRC remainder on \overline{CS} rising edges. If no error exists, the CRC remainder is zero and data are accepted by the device.

A write operation failing the CRC check causes the data to be ignored by the device. After the write command, a second access cycle can be issued to determine the error checking result (CRC-ERROR bit) on the SDO pin, as shown in Table 5. Additionally, by setting ALM-EN = 1 and ALM-SEL = 0 in the CONFIG register, the SDO/ALARM pin is configured as a CRC alarm pin.

Table 5. Write Operation Error Checking Cycle

BIT	FIELD	DESCRIPTION
31	RW	Echo RW from previous access cycle (RW = 0).
30	CRC-ERROR	Returns a 1 when a CRC error is detected, 0 otherwise.
29:28	Reserved	Echo bits 29:28 from previous access cycle (all zeros).
27:24	A[3:0]	Echo address from previous access cycle.
23:8	DO[15:0]	Echo data from previous access cycle.
7:0	CRC	Calculated CRC value of bits 31:8.

A read operation must be followed by a second access cycle to get the requested data on the SDO pin. The error check result (CRC-ERROR bit) from the read command is output on the SDO pin, as shown in Table 6. As in the case of a write operation failing the CRC check, the SDO/ALARM pin if configured as a CRC alarm pin can be used to indicate a read command CRC failure.

Table 6. Read Operation Error Checking Cycle

BIT	FIELD	DESCRIPTION
31	RW	Echo RW from previous access cycle (RW = 1).
30	CRC-ERROR	Returns a 1 when a CRC error is detected, 0 otherwise.
29:28	Reserved	Echo bits 29:28 from previous access cycle (all zeros).
27:24	A[3:0]	Echo address from previous access cycle.
23:8	DO[15:0]	Readback data requested on previous access cycle.
7:0	CRC	Calculated CRC value of bits 31:8.

9.4.4 Power-Down Mode

The DACx0504 DAC output amplifiers and internal reference can be independently powered down through the CONFIG register. At power-up all output channels and the device internal reference are active by default. A DAC output channel in power-down mode is connected internally to GND through a 1-kΩ resistor.

9.5 Programming

The DACx0504 is controlled through a flexible four-wire serial interface that is compatible with SPI type interfaces used on many microcontrollers and DSP controllers. The interface provides read and write access to all DACx0504 registers and can also be configured to daisy-chain multiple devices for write operations. The DACx0504 incorporates an optional error checking mode to validate SPI data communication integrity in noisy environments. [Table 7](#) shows the SPI timing requirements. [Figure 62](#) and [Figure 63](#) show the SPI write and read timing diagrams, respectively. [Figure 64](#) shows the digital logic timing diagram.

Data follows the format below: DAC80504: { DATA[15:0] } DAC70504: { DATA[13:0], x, x } DAC60504: { DATA[11:0], x, x, x, x } x – Don't care bits

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The high linearity, small package size and wide temperature range make the DACx0504 suitable in applications such as optical networking, wireless infrastructure, industrial automation and data acquisition systems. The device incorporates a 2.5 V internal reference with an internal reference divider circuit that enables full-scale DAC output voltages of 1.25 V, 2.5 V, or 5 V.

10.1.1 Interfacing to a Microcontroller

Figure 74 displays a typical serial interface that may be observed when connecting the DACx0504 SPI serial interface to a (master) microcontroller type platform. The setup for the interface is as follows: the microcontroller output SPI CLK drives the $\overline{\text{SCLK}}$ pin of the DACx0504, while the DACx0504 SDI pin is driven by the MOSI pin of the microcontroller. The $\overline{\text{CS}}$ pin of the DACx0504 can be asserted from a general program input/output pin of the microcontroller. When data are to be transmitted to the DACx0504, the $\overline{\text{CS}}$ pin is taken low. The data from the microcontroller is then transmitted to the DACx0504, totaling 24 bits latched into the DACx0504 device through the falling edge of SCLK. $\overline{\text{CS}}$ is then brought high after the completed write. The DACx0504 requires data with the MSB as the first bit received.

Figure 74. Typical Serial Interface

Application Information (continued)

10.1.2 Programmable Current Source Circuit

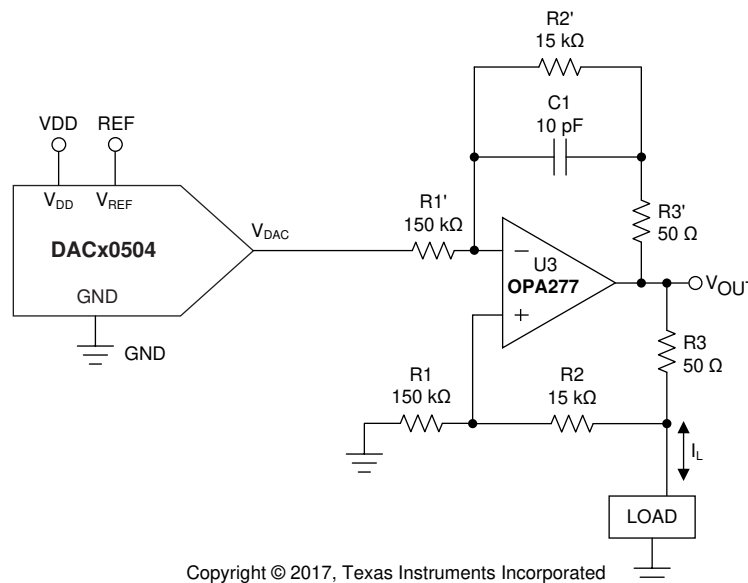

The DACx0504 can be integrated into the circuit in [Figure 75](#) to implement an improved Howland current pump for precise voltage to current conversions. Bidirectional current flow and high voltage compliance are two features of the circuit. With a matched resistor network, the load current of the circuit is shown by [Equation 2](#).

$$I_L = \frac{(R2 + R3) / R1}{R3} \times V_{REF} \times \frac{CODE}{2^n} \quad (2)$$

The value of R3 in [Equation 2](#) can be reduced to increase the output current drive of U3. U3 can drive ± 20 mV in both directions with voltage compliance limited up to 15 V by the U3 voltage supply. Elimination of the circuit compensation capacitor C1 in the circuit is not suggested as a result of the change in the output impedance Z_O , according to [Equation 3](#).

$$Z_O = \frac{(R1')(R3)(R1 + R2)}{R1(R2' + R3') - R1'(R2 + R3)} \quad (3)$$

As shown in [Equation 3](#), with matched resistors, Z_O is infinite and the circuit is optimum for use as a current source. However, if unmatched resistors are used, Z_O is positive or negative with negative output impedance being a potential cause of oscillation. Therefore, by incorporating C1 into the circuit, possible oscillation problems are eliminated. The value of C1 can be determined for critical applications; for most applications, however, a value of several pF is suggested.

Figure 75. Programmable Bidirectional Current Source Circuit

10.2 Typical Application

The DACx0504 is designed for single-supply operation; however, a bipolar output is also possible using the circuit shown in Figure 76.

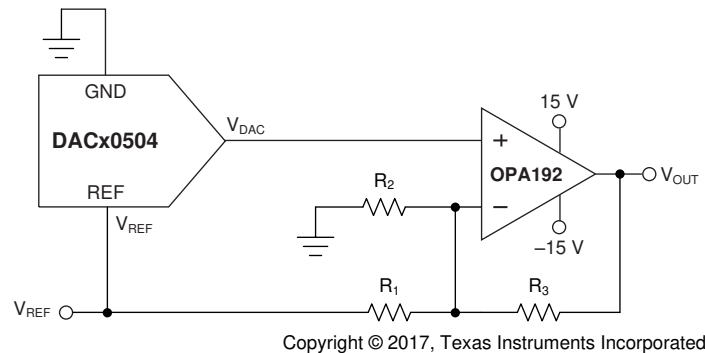

Figure 76. Bipolar Operation Using the DACx0504

10.2.1 Design Requirements

The circuit shown in Figure 76 gives a bipolar output voltage at V_{OUT} . When GAIN = 1, V_{OUT} can be calculated using Equation 4:

$$V_{OUT}(\text{CODE}) = \left[\left(V_{REF} \times \frac{\text{CODE}}{2^n} \right) \left(1 + \frac{R_3}{R_2} + \frac{R_3}{R_1} \right) - \left(V_{REF} \times \frac{R_3}{R_1} \right) \right]$$

where

- $V_{OUT}(\text{CODE})$ = output voltage versus code
- CODE = 0 to $2^n - 1$. This is the digital code loaded to the DAC
- V_{REF} = reference voltage applied to the DACx0504
- n = resolution in bits

(4)

Table 18. Design Parameters

PARAMETER	VALUE
V_{OUT}	± 10 V
V_{REF}	2.5 V
n	12

10.2.2 Detailed Design Procedure

The bipolar output span can be calculated through Equation 4 by defining a few parameters, the first being the value for the reference voltage. Once a reference voltage is chosen, the gain resistors can be set accordingly by determining the desired V_{OUT} at code 0 and code 2^n . For a V_{REF} of 2.5 V and a desired output voltage range of ± 10 V the calculation is as follows.

CODE = 0:

$$V_{OUT}(0) = - \left(V_{REF} \times \frac{R_3}{R_1} \right) = - \left(2.5\text{V} \times \frac{R_3}{R_1} \right)$$

(5)

Setting the equation to minimum output span, $V_{OUT}(0) = -10$ V, will reduce the equation to: $R_3/R_1 = 4$:

CODE = 4096:

Setting the equation to maximum output scan, $V_{OUT}(4096) = 10$ V, and $R_3/R_1 = 4$ will reduce the equation to: $R_3/R_2 = 3$

It is important to note that the maximum code of a 12-bit DAC is 4095; code 4096 was used to simplify the equation above. For practical use, the true output span will encompass a range of -10 V to $(10$ V $- 1$ LSB), which in this case is -10 V to 9.995 V.

10.2.3 Application Curve

The ± 10 V output span with a reference voltage of 2.5 V can be achieved by using values of 30 k Ω , 10 k Ω , and 7.5 k Ω for R3, R2, and R1, respectively. A curve to illustrate this output span is shown in [Figure 77](#). For this example, 1% tolerance resistors were used in evaluating bipolar operation.

Figure 77. Bipolar Operation

11 Power Supply Recommendations

The DACx0504 operates within the specified V_{DD} supply range of 2.7 V to 5.5 V, and V_{IO} supply range of 1.7 V to 5.5 V. The DACx0504 does not require specific supply sequencing.

The V_{DD} supply must be well-regulated and low-noise. Switching power supplies and dc-dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. In order to further minimize noise from the power supply, include a 1- μ F to 10- μ F capacitor and 0.1- μ F bypass capacitor. The current consumption on the V_{DD} pin, the short-circuit current limit, and the load current for the device is listed in the [Electrical Characteristics](#). The power supply must meet the aforementioned current requirements.

12 Layout

12.1 Layout Guidelines

A precision analog component requires careful layout, the list below provides some insight into good layout practices.

- Bypass all power supply pins to ground with a low-ESR ceramic bypass capacitor. The typical recommended bypass capacitance is 0.1- μ F to 0.22- μ F ceramic with a X7R or NP0 dielectric.
- Place power supplies and REF bypass capacitors close to the pins to minimize inductance and optimize performance.
- Use a high-quality ceramic type NP0 or X7R for its optimal performance across temperature, and very low dissipation factor.
- The digital and analog sections must have proper placement with respect to the digital pins and analog pins of the DACx0504 device. The separation of analog and digital blocks minimizes coupling into neighboring blocks, as well as interaction between analog and digital return currents.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
