TEXAS INSTRUMENTS

DLP3310 0.33 1080p DMD

1 特長

- 0.33 インチ (8.47mm) 対角マイクロミラー・アレイ
  - 画面にフル HD の 1920 × 1080 ピクセルを表示
  - マイクロミラー・ピッチ：5.4μm
  - マイクロミラー傾斜角：17° (水平面に対して)
  - 側面照明による最適な効率と光学エンジン・サイズ
  - 偏波無依存のアルミニウム製マイクロミラー表面
- 32 ビット SubLVDS 入力データ・バス
- 専用の DLPC3437 コントローラと DLPA3000/DLPA3005 PMIC/LED ドライバによる信頼性の高い動作

2 アプリケーション

- モバイル・スマート TV
- スクリーンレス TV
- ゲーム・ディスプレイ
- デジタル・サイネージ
- ウェアラブル・ディスプレイ
- Pico プロジェクタ
- 対話型ディスプレイ
- ウルトラ・モバイル・ディスプレイ
- スマート・ホーム・ディスプレイ
- 仮想アシスタント

3 概要

DLP3310 デジタル・マイクロミラー・デバイス (DMD) は、デジタル制御の MOEMS (micro-opto-electromechanical system) 空間光変調器 (SLM) です。適切な光学システムと組み合わせることで、DLP3310 DMD は鮮明で高品質の画像または映像を表示できます。DLP3310 は、DLP3310 DMD、DLPC3437 コントローラ、DLPA3000/DLPA3005 PMIC/LED ドライバで構成されるチップセットの一部です。DLP3310 は物理的なサイズが小さく、コントローラや PMIC/LED ドライバと組み合わせることにより、小さな外形、低消費電力、フル HD 表示を可能にする、完全なシステム・ソリューションが実現します。

製品情報[1]

部品番号	パッケージ	本体サイズ (公称)
DLP3310	FQM (92)	19.25mm × 7.2mm

(1) 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。

(1) Low speed interface is LPSDR and adheres to the Electrical Characteristics and AC/DC Operating Conditions table in JEDEC Standard No. 209B, *Low Power Double Data Rate (LPDDR)*. See JESD209B.
(2) Net trace lengths inside the package:
Relative dielectric constant for the FQM ceramic package is 9.8.
Propagation speed = 11.8 / sqrt (9.8) = 3.769 in/ns.
Propagation delay = 0.265 ns/inch = 265 ps/in = 10.43 ps/mm.
(3) The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, V_{RESET}. All V_{SS} connections are also required.

6 Specifications

6.1 Absolute Maximum Ratings

see [1]

			MIN	MAX	UNIT
Supply voltage	V_{DD}	Supply voltage for LVCMOS core logic[2] Supply voltage for LPSDR low speed interface	–0.5	2.3	V
	V_{DDI}	Supply voltage for SubLVDS receivers[2]	–0.5	2.3	V
	V_{OFFSET}	Supply voltage for HVCMOS and micromirror electrode[2] [3]	–0.5	11	V
	V_{BIAS}	Supply voltage for micromirror electrode[2]	–0.5	19	V
	V_{RESET}	Supply voltage for micromirror electrode[2]	–15	0.5	V
	$|V_{DDI}–V_{DD}|$	Supply voltage delta (absolute value)[4]		0.3	V
	$|V_{BIAS}–V_{OFFSET}|$	Supply voltage delta (absolute value)[5]		11	V
	$|V_{BIAS}–V_{RESET}|$	Supply voltage delta (absolute value)[6]		34	V
Input voltage		Input voltage for other inputs LPSDR[2]	–0.5	V_{DD} + 0.5	V
		Input voltage for other inputs SubLVDS[2] [7]	–0.5	V_{DDI} + 0.5	V
Input pins	$|V_{ID}|$	SubLVDS input differential voltage (absolute value)[7]		810	mV
	I_{ID}	SubLVDS input differential current		10	mA
Clock frequency	f_{clock}	Clock frequency for low speed interface LS_CLK		130	MHz
	f_{clock}	Clock frequency for high speed interface DCLK		620	MHz
Environmental	T_{ARRAY} and T_{WINDOW}	Temperature—operational[8]	–20	90	°C
		Temperature—non-operational[8]	–40	90	°C
	$|T_{DELTA}|$	Absolute temperature delta between any point on the window edge and the ceramic test point TP1[9]		30	°C
	T_{DP}	Dew point—operating and non-operating		81	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) All voltage values are with respect to the ground terminals (V_{SS}). The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, and V_{RESET}. All V_{SS} connections are also required.
(3) V_{OFFSET} supply transients must fall within specified voltages.
(4) Exceeding the recommended allowable absolute voltage difference between V_{DDI} and V_{DD} may result in excessive current draw.
(5) Exceeding the recommended allowable absolute voltage difference between V_{BIAS} and V_{OFFSET} may result in excessive current draw.
(6) Exceeding the recommended allowable absolute voltage difference between V_{BIAS} and V_{RESET} may result in excessive current draw.
(7) This maximum input voltage rating applies when each input of a differential pair is at the same voltage potential. Sub-LVDS differential inputs must not exceed the specified limit or damage may result to the internal termination resistors.
(8) The highest temperature of the active array (as calculated by the *Micromirror Array Temperature Calculation*) or of any point along the window edge as defined in 図 7-1. The locations of thermal test points TP2, TP3, TP4, and TP5 in 図 7-1 are intended to measure the highest window edge temperature. If a particular application causes another point on the window edge to be at a higher temperature, that point should be used.
(9) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge as shown in 図 7-1. The window test points TP2, TP3, TP4, and TP5 shown in 図 7-1 are intended to result in the worst case delta. If a particular application causes another point on the window edge to result in a larger delta temperature, that point should be used.

6.2 Storage Conditions

applicable for the DMD as a component or non-operating in a system.

		MIN	MAX	UNIT
T_{DMD}	DMD storage temperature	–40	85	°C
T_{DP-AVG}	Average dew point temperature (non-condensing)[1]		24	°C
T_{DP-ELR}	Elevated dew point temperature range (non-condensing)[2]	28	36	°C

Product Folder Links: *DLP3310*

English Data Sheet: DLPS124

applicable for the DMD as a component or non-operating in a system.

		MIN	MAX	UNIT
CT_{ELR}	Cumulative time in elevated dew point temperature range		6	Months

(1) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.

(2) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

6.3 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

6.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)[1] [2]

		MIN	NOM	MAX	UNIT
SUPPLY VOLTAGE RANGE[3]					
V_{DD}	Supply voltage for LVCMOS core logic Supply voltage for LPSDR low-speed interface	1.65	1.8	1.95	V
V_{DDI}	Supply voltage for SubLVDS receivers	1.65	1.8	1.95	V
V_{OFFSET}	Supply voltage for HVCMOS and micromirror electrode[4]	9.5	10	10.5	V
V_{BIAS}	Supply voltage for mirror electrode	17.5	18	18.5	V
V_{RESET}	Supply voltage for micromirror electrode	−14.5	−14	−13.5	V
$|V_{DDI}{-}V_{DD}|$	Supply voltage delta (absolute value)[5]			0.3	V
$|V_{BIAS}{-}V_{OFFSET}|$	Supply voltage delta (absolute value)[6]			10.5	V
$|V_{BIAS}{-}V_{RESET}|$	Supply voltage delta (absolute value)[7]			33	V
CLOCK FREQUENCY					
f_{clock}	Clock frequency for low speed interface LS_CLK[8]	108		120	MHz
f_{clock}	Clock frequency for high speed interface DCLK[9]	300		540	MHz
	Duty cycle distortion DCLK	44%		56%	
SUBLVDS INTERFACE[9]					
$|V_{ID}|$	SubLVDS input differential voltage (absolute value). See 図 6-8, 図 6-9.	150	250	350	mV
V_{CM}	Common mode voltage. See 図 6-8, 図 6-9.	700	900	1100	mV
$V_{SUBLVDS}$	SubLVDS voltage. See 図 6-8, 図 6-9.	575		1225	mV
Z_{LINE}	Line differential impedance (PWB/trace)	90	100	110	Ω
Z_{IN}	Internal differential termination resistance. See 図 6-10.	80	100	120	Ω
	100-Ω differential PCB trace	6.35		152.4	mm
ENVIRONMENTAL					
T_{ARRAY}	Array temperature – long-term operational[10] [11] [12] [13]	0		40 to 70[12]	°C
	Array temperature – short-term operational, 25 hr max[11] [14]	−20		−10	°C
	Array temperature – short-term operational, 500 hr max[11] [14]	−10		0	°C
	Array temperature – short-term operational, 500 hr max[11] [14]	70		75	°C
T_{WINDOW}	Window temperature – operational[15] [16]			90	°C
$|T_{DELTA}|$	Absolute temperature delta between any point on the window edge and the ceramic test point TP1[17]			15	°C
T_{DP-AVG}	Average dew point temperature, non-condensing[18]			24	°C
T_{DP-ELR}	Elevated dew point temperature range, non-condensing[19]	28		36	°C
CT_{ELR}	Cumulative time in elevated dew point temperature range			6	Months

Product Folder Links: *DLP3310*

English Data Sheet: *DLPS124*

6.4 Recommended Operating Conditions (continued)

Over operating free-air temperature range (unless otherwise noted)[1] [2]

		MIN	NOM	MAX	UNIT
ILLUMINATION					
ILL_{UV}	Illumination power at wavelengths < 410 nm[10]			10	mW/cm^2
ILL_{VIS}	Illumination power at wavelengths ≥ 410 nm and ≤ 800 nm[20]			26.1	W/cm^2
ILL_{IR}	Illumination power at wavelengths > 800 nm			10	mW/cm^2
ILL_{BLU}	Illumination power at wavelengths ≥ 410 nm and ≤ 475 nm[20]			8.3	W/cm^2
ILL_{BLU1}	Illumination power at wavelengths ≥ 410 nm and ≤ 445 nm[20]			1.5	W/cm^2
ILL_θ	Illumination marginal ray angle[16]			55	deg

(1) The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, and V_{RESET}. All V_{SS} connections are also required.

(2) The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by the *Recommended Operating Conditions*. No level of performance is implied when operating the device above or below the *Recommended Operating Conditions* limits.

(3) All voltage values are with respect to the ground pins (V_{SS}).

(4) V_{OFFSET} supply transients must fall within specified max voltages.

(5) To prevent excess current, the supply voltage delta $|V_{DDI} - V_{DD}|$ must be less than the specified limit.

(6) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{OFFSET}|$ must be less than the specified limit.

(7) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{RESET}|$ must be less than the specified limit.

(8) LS_CLK must run as specified to ensure internal DMD timing for reset waveform commands.

(9) Refer to the SubLVDS timing requirements in *Timing Requirements*.

(10) Simultaneous exposure of the DMD to the maximum *Recommended Operating Conditions* for temperature and UV illumination will reduce device lifetime.

(11) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1) shown in 図 7-1 and the package thermal resistance using the *Micromirror Array Temperature Calculation*.

(12) Per 図 6-1, the maximum operational array temperature should be derated based on the micromirror landed duty cycle that the DMD experiences in the end application. Refer to セクション 7.8 for a definition of micromirror landed duty cycle.

(13) Long-term is defined as the useful life of the device.

(14) Short-term is the total cumulative time over the useful life of the device.

(15) The locations of thermal test points TP2, TP3, TP4, and TP5 shown in 図 7-1 are intended to measure the highest window edge temperature. For most applications, the locations shown are representative of the highest window edge temperature. If a particular application causes additional points on the window edge to be at a higher temperature, test points should be added to those locations.

(16) The maximum marginal ray angle of the incoming illumination light at any point in the micromirror array, including Pond of Micromirrors (POM), should not exceed 55 degrees from the normal to the device array plane. The device window aperture has not necessarily been designed to allow incoming light at higher maximum angles to pass to the micromirrors, and the device performance has not been tested nor qualified at angles exceeding this. Illumination light exceeding this angle outside the micromirror array (including POM) will contribute to thermal limitations described in this document, and may negatively affect lifetime.

(17) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge shown in 図 7-1. The window test points TP2, TP3, TP4, and TP5 shown in 図 7-1 are intended to result in the worst case delta temperature. If a particular application causes another point on the window edge to result in a larger delta temperature, that point should be used.

(18) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.

(19) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

(20) The maximum allowable optical power incident on the DMD is limited by the maximum optical power density for each wavelength range specified and the micromirror array temperature (T_{ARRAY}).
図 6-1. Maximum Recommended Array Temperature—Derating Curve

English Data Sheet: DLPS124

6.5 Thermal Information

THERMAL METRIC[1]	DLP3310 FQM (LGA) 92 PINS	UNIT
Thermal resistance Active area to test point 1 (TP1)	6.0	°C/W

(1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the package within the temperature range specified in *Recommended Operating Conditions*. The total heat load on the DMD is largely driven by the incident light absorbed by the active area; although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array. Optical systems should be designed to minimize the light energy falling outside the window clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

6.6 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted)[1]

PARAMETER		TEST CONDITIONS[2]	MIN	TYP	MAX	UNIT
CURRENT						
I_{DD}	Supply current: V_{DD} [3] [4]	V_{DD} = 1.95 V			135	mA
		V_{DD} = 1.8 V		123.6		
I_{DDI}	Supply current: V_{DDI} [3] [4]	V_{DDI} = 1.95 V			35.34	mA
		V_{DD} = 1.8 V		32

LPSDR OUTPUT[10]						
V_{OH}	DC output high voltage	I_{OH} = −2 mA	$0.8 \times V_{DD}$			V

6.6 Electrical Characteristics (continued)

Over operating free-air temperature range (unless otherwise noted)[1]

PARAMETER		TEST CONDITIONS[2]	MIN	TYP	MAX	UNIT
V_{OL}	DC output low voltage	I_{OL} = 2 mA			$0.2 \times V_{DD}$	V
CAPACITANCE						
C_{IN}	Input capacitance LPSDR	f = 1 MHz			10	pF
	Input capacitance SubLVDS	f = 1 MHz			20	pF
C_{OUT}	Output capacitance	f = 1 MHz			10	pF
C_{RESET}	Reset group capacitance	f = 1 MHz; (768 × 344) micromirrors	400		500	pF

(1) Device electrical characteristics are in *Recommended Operating Conditions*, unless otherwise noted.
(2) All voltage values are with respect to the ground pins (V_{SS}).
(3) To prevent excess current, the supply voltage delta $|V_{DDI} - V_{DD}|$ must be less than the specified limit.
(4) Supply power dissipation based on non–compressed commands and data.
(5) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{OFFSET}|$ must be less than the specified limit.
(6) Supply power dissipation based on 3 global resets in 200 µs.
(7) The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, V_{RESET}. All V_{SS} connections are also required.
(8) LPSDR specifications are for pins LS_CLK and LS_WDATA.
(9) Low-speed interface is LPSDR and adheres to the Electrical Characteristics and AC/DC Operating Conditions table in JEDEC Standard No. 209B, *Low-Power Double Data Rate (LPDDR)* JESD209B.
(10) LPSDR specification is for pin LS_RDATA.

6.7 Timing Requirements

Device electrical characteristics are over *Recommended Operating Conditions* unless otherwise noted.

			MIN	NOM	MAX	UNIT

6.10 Micromirror Array Physical Characteristics

PARAMETER		VALUE	UNIT
Number of active columns	See 図 6-15 [2].	1368	micromirrors
Number of active rows	See 図 6-15 [2].	768	micromirrors
Micromirror (pixel) pitch	See 図 6-16.	5.4	μm
Micromirror active array width	Micromirror pitch × number of active columns; see 図 6-15.	7.387	mm
Micromirror active array height	Micromirror pitch × number of active rows; see 図 6-15.	4.147	mm
Micromirror active border	Pond of micromirror (POM)[1]	20	micromirrors/side

(1)　The structure and qualities of the border around the active array includes a band of partially functional micromirrors called the POM. These micromirrors are structurally and/or electrically prevented from tilting toward the bright or ON state, but still require an electrical bias to tilt toward OFF.

(2)　The fast switching speed of the DMD micromirrors combined with advanced DLP image processing algorithms enable each micromirror to display two distinct pixels on the screen during every frame, resulting in a full 1920 × 1080 pixel image being displayed.

図 6-15. Micromirror Array Physical Characteristics

6.11 Micromirror Array Optical Characteristics

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
Micromirror tilt angle		DMD landed state[1]		17		degree
Micromirror tilt angle tolerance[2] [3] [4] [5]			−1.4		1.4	degree
Micromirror tilt direction[6] [7]		Landed ON state		180		degree
		Landed OFF state		270		
Micromirror crossover time[8]		Typical performance		1	3	µs
Micromirror switching time[9]		Typical performance	10			
Image performance[10]	Bright pixel(s) in active area[11]	Gray 10 Screen[12]			0	micromirrors
	Bright pixel(s) in the POM[13]	Gray 10 Screen[12]			1	
	Dark pixel(s) in the active area[14]	White Screen			4	
	Adjacent pixel(s)[15]	Any Screen			0	
	Unstable pixel(s) in active area[16]	Any Screen			0	

(1) Measured relative to the plane formed by the overall micromirror array.
(2) Additional variation exists between the micromirror array and the package datums.
(3) Represents the landed tilt angle variation relative to the nominal landed tilt angle.
(4) Represents the variation that can occur between any two individual micromirrors, located on the same device or located on different devices.
(5) For some applications, it is critical to account for the micromirror tilt angle variation in the overall system optical design. With some system optical designs, the micromirror tilt angle variation within a device may result in perceivable non-uniformities in the light field reflected from the micromirror array. With some system optical designs, the micromirror tilt angle variation between devices may result in colorimetry variations, system efficiency variations, or system contrast variations.
(6) When the micromirror array is landed (not parked), the tilt direction of each individual micromirror is dictated by the binary contents of the CMOS memory cell associated with each individual micromirror. A binary value of 1 results in a micromirror landing in the ON state direction. A binary value of 0 results in a micromirror landing in the OFF state direction. See 図 6-17.
(7) Micromirror tilt direction is measured as in a typical polar coordinate system: Measuring counter-clockwise from a 0° reference which is aligned with the +X Cartesian axis.
(8) The time required for a micromirror to nominally transition from one landed state to the opposite landed state.
(9) The minimum time between successive transitions of a micromirror.
(10) Conditions of Acceptance: All DMD image quality returns will be evaluated using the following projected image test conditions:
　　Test set degamma shall be linear
　　Test set brightness and contrast shall be set to nominal
　　The diagonal size of the projected image shall be a minimum of 20 inches
　　The projections screen shall be 1X gain
　　The projected image shall be inspected from a 38 inch minimum viewing distance
　　The image shall be in focus during all image quality tests
(11) Bright pixel definition: A single pixel or mirror that is stuck in the ON position and is visibly brighter than the surrounding pixels
(12) Gray 10 screen definition: All areas of the screen are colored with the following settings:
　　Red = 10/255
　　Green = 10/255
　　Blue = 10/255
(13) POM definition: Rectangular border of off-state mirrors surrounding the active area
(14) Dark pixel definition: A single pixel or mirror that is stuck in the OFF position and is visibly darker than the surrounding pixels
(15) Adjacent pixel definition: Two or more stuck pixels sharing a common border or common point, also referred to as a cluster
(16) Unstable pixel definition: A single pixel or mirror that does not operate in sequence with parameters loaded into memory. The unstable pixel appears to be flickering asynchronously with the image

Not to Scale

6.12 Window Characteristics

PARAMETER[1]		MIN	NOM	MAX	UNIT
Window material			Corning Eagle XG		
Window refractive index	at wavelength 546.1 nm		1.5119		
Window aperture[2]				See[2]	
Illumination overfill[3]				See[3]	
Window transmittance, single-pass through both surfaces and glass	Minimum within the wavelength range 420 to 680 nm. Applies to all angles 0° to 30° AOI.	97%			
Window Transmittance, single-pass through both surfaces and glass	Average over the wavelength range 420 to 680 nm. Applies to all angles 30° to 45° AOI.	97%			

(1) See セクション 7.5 for more information.
(2) See the package mechanical characteristics for details regarding the size and location of the window aperture.
(3) The active area of the DLP3310 device is surrounded by an aperture on the inside of the DMD window surface that masks structures of the DMD device assembly from normal view. The aperture is sized to anticipate several optical conditions. Overfill light illuminating the area outside the active array can scatter and create adverse effects to the performance of an end application using the DMD. The illumination optical system should be designed to limit light flux incident outside the active array to less than 10% of the average flux level in the active area. Depending on the particular system's optical architecture and assembly tolerances, the amount of overfill light on the outside of the active array may cause system performance degradation.

6.13 Chipset Component Usage Specification

注

TI assumes no responsibility for image quality artifacts or DMD failures caused by optical system operating conditions exceeding limits described previously.

The DLP3310 is a component of one or more DLP® chipsets. Reliable function and operation of the DLP3310 requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology consists of the TI technology and devices for operating or controlling a DLP DMD.

6.14 Software Requirements

注意

The DLP3310 DMD has mandatory software requirements. Refer to *Software Requirements for TI DLP®Pico™ TRP Digital Micromirror Devices* application report for additional information. Failure to use the specified software will result in failure at power up.
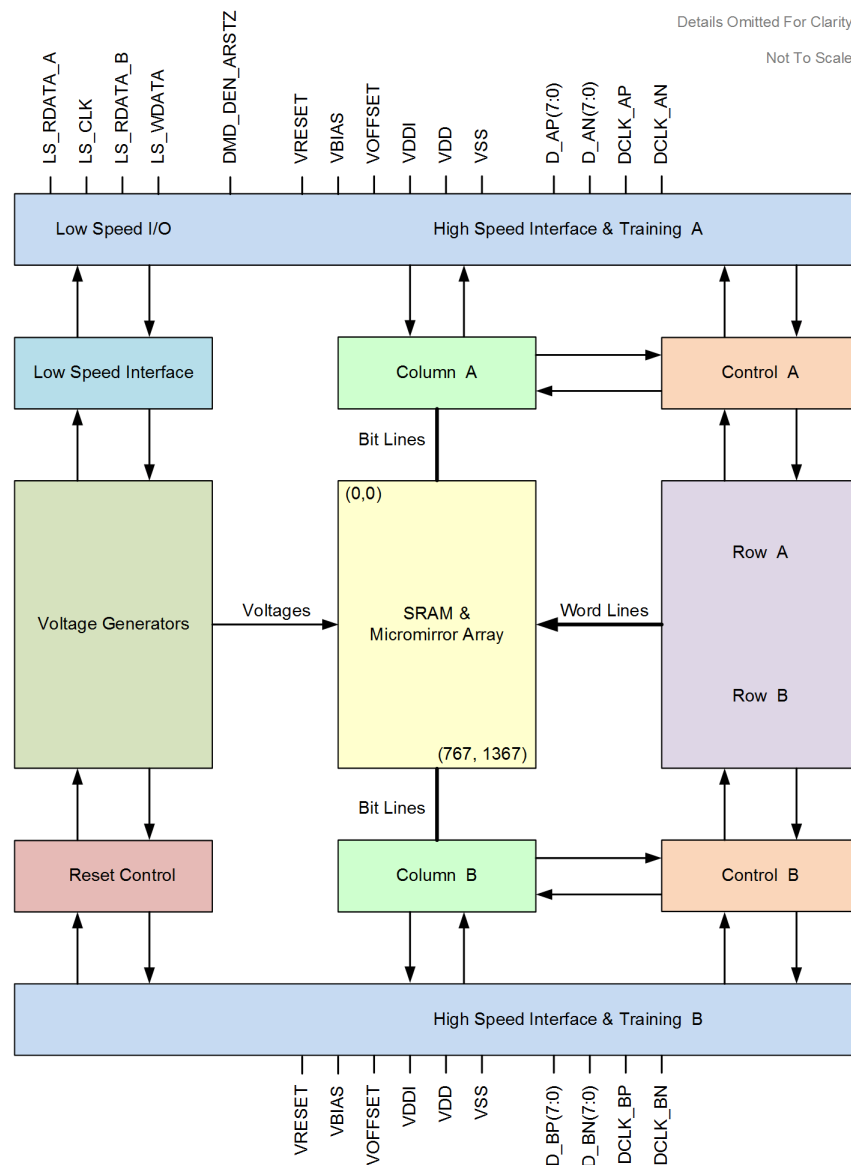

7 Detailed Description

7.1 Overview

The DLP3310 is a 0.33 inch diagonal spatial light modulator of aluminum micromirrors. Pixel array size is 1368 columns by 768 rows in a square grid pixel arrangement. The fast switching speed of the DMD micromirrors combined with advanced DLP image processing algorithms enables each micromirror to display two distinct pixels on the screen during every frame, resulting in a full 1920 x 1080 pixel image being displayed. The electrical interface is Sub Low Voltage Differential Signaling (SubLVDS) data.

The DLP3310 is part of the chipset composed of the DLP3310 DMD, DLPC3437 controller, and DLPA3000/DLPA3005 PMIC/LED driver. To ensure reliable operation, the DLP3310 DMD must always be used with the DLPC3437 controller and the DLPA3000/DLPA3005 PMIC/LED drivers.

7.2 Functional Block Diagram

A. Details omitted for clarity.

7.3 Feature Description

7.3.1 Power Interface

The power management IC DLPA3000/DLPA3005 contains three regulated DC supplies for the DMD reset circuitry: V_{BIAS}, V_{RESET} , and V_{OFFSET}, as well as the two regulated DC supplies for the DLPC3437 controller.

7.3.2 Low-Speed Interface

The Low Speed Interface handles instructions that configure the DMD and control reset operation. LS_CLK is the low–speed clock, and LS_WDATA is the low speed data input.

7.3.3 High-Speed Interface

The purpose of the high-speed interface is to transfer pixel data rapidly and efficiently, making use of high speed DDR transfer and compression techniques to save power and time. The high-speed interface is composed of differential SubLVDS receivers for inputs, with a dedicated clock.

7.3.4 Timing

The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. 図 6-13 shows an equivalent test load circuit for the output under test. Timing reference loads are not intended as a precise representation of any particular system environment or depiction of the actual load presented by a production test. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.4 Device Functional Modes

DMD functional modes are controlled by the DLPC3437 controller. For more information, see the *DLPC3437 DLPC3437 Display Controller Data Sheet* or contact a TI applications engineer.

7.5 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. Optimizing system optical performance and image quality strongly relate to optical system design parameter trades. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

7.5.1 Numerical Aperture and Stray Light Control

The angle defined by the numerical aperture of the illumination and projection optics at the DMD optical area should be the same. This angle should not exceed the nominal device micromirror tilt angle unless appropriate apertures are added in the illumination and/or projection pupils to block out flat-state and stray light from the projection lens. The micromirror tilt angle defines DMD capability to separate the "ON" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the micromirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle (and vice versa), contrast degradation and objectionable artifacts in the display border and/or active area could occur.

7.5.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display's border and/or active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

7.5.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view, and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. The illumination optical system should be designed to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the average flux level in the active area. Depending on the particular system's optical architecture, overfill light may have to be further reduced below the suggested 10% level in order to be acceptable.

7.6 Micromirror Array Temperature Calculation
図 7-1. DMD Thermal Test Points

English Data Sheet: DLPS124

Micromirror array temperature cannot be measured directly, therefore it must be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The relationship between array temperature and the reference ceramic temperature (thermal test TP1 in 図 7-1) is provided by the following equations:

$$T_{ARRAY} = T_{CERAMIC} + (Q_{ARRAY} \times R_{ARRAY\text{-}TO\text{-}CERAMIC})$$

$$Q_{ARRAY} = Q_{ELECTRICAL} + Q_{ILLUMINATION}$$

where

- T_{ARRAY} = Computed array temperature (°C)

- $T_{CERAMIC}$ = Measured ceramic temperature (°C) (TP1 location)

- $R_{ARRAY\text{-}TO\text{-}CERAMIC}$ = Thermal resistance of package specified in *Thermal Information* from array to ceramic TP1 (°C/Watt)

- Q_{ARRAY} = Total DMD power on the array (W) (electrical + absorbed)

- $Q_{ELECTRICAL}$ = Nominal electrical power (W)

- $Q_{INCIDENT}$ = Incident illumination optical power (W)

- $Q_{ILLUMINATION}$ = (DMD average thermal absorptivity × $Q_{INCIDENT}$) (W)

- DMD average thermal absorptivity = 0.4

The electrical power dissipation of the DMD is variable and depends on the voltages, data rates and operating frequencies. A nominal electrical power dissipation to use when calculating array temperature is 0.16 Watts. The absorbed power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. The equations shown above are valid for a single chip or multichip DMD system. It assumes an illumination distribution of 83.7% on the active array, and 16.3% on the array border.

The sample calculation for a typical projection application is as follows:

$Q_{INCIDENT}$ = 5.9 W (measured)

$T_{CERAMIC}$ = 52.0°C (measured)

$Q_{ELECTRICAL}$ = 0.16 W

Q_{ARRAY} = 0.16 W + (0.40 × 5.9 W) = 2.52 W

T_{ARRAY} = 52.0°C + (2.52 W × 6.0°C/W) = 67.1°C

7.7 Micromirror Power Density Calculation

The calculation of the optical power density of the illumination on the DMD in the different wavelength bands uses the total measured optical power on the DMD, percent illumination overfill, area of the active array, and ratio of the spectrum in the wavelength band of interest to the total spectral optical power.

- $ILL_{UV} = [OP_{UV\text{-}RATIO} \times Q_{INCIDENT}] \times 1000 \div A_{ILL}$ (mW/cm^2)

- $ILL_{VIS} = [OP_{VIS\text{-}RATIO} \times Q_{INCIDENT}] \div A_{ILL}$ (W/cm^2)

- $ILL_{IR} = [OP_{IR\text{-}RATIO} \times Q_{INCIDENT}] \times 1000 \div A_{ILL}$ (mW/cm^2)

- $ILL_{BLU} = [OP_{BLU\text{-}RATIO} \times Q_{INCIDENT}] \div A_{ILL}$ (W/cm^2)

- $ILL_{BLU1} = [OP_{BLU1\text{-}RATIO} \times Q_{INCIDENT}] \div A_{ILL}$ (W/cm^2)

- $A_{ILL} = A_{ARRAY} \div (1 - OV_{ILL})$ (cm^2)

where:

- ILL_{UV} = UV illumination power density on the DMD (mW/cm^2)

- ILL_{VIS} = VIS illumination power density on the DMD (W/cm^2)

- ILL_{IR} = IR illumination power density on the DMD (mW/cm^2)

- ILL_{BLU} = BLU illumination power density on the DMD (W/cm^2)

- ILL_{BLU1} = BLU1 illumination power density on the DMD (W/cm^2)

- A_{ILL} = illumination area on the DMD (cm^2)

- $Q_{INCIDENT}$ = total incident optical power on DMD (W) (measured)

- A_{ARRAY} = area of the array (cm^2) (data sheet)

- OV_{ILL} = percent of total illumination on the DMD outside the array (%) (optical model)

- $OP_{UV-RATIO}$ = ratio of the optical power for wavelengths <410 nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{VIS-RATIO}$ = ratio of the optical power for wavelengths ≥410 and ≤800 nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{IR-RATIO}$ = ratio of the optical power for wavelengths >800 nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{BLU-RATIO}$ = ratio of the optical power for wavelengths ≥410 and ≤475 nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{BLU1-RATIO}$ = ratio of the optical power for wavelengths ≥410 and ≤445 nm to the total optical power in the illumination spectrum (spectral measurement)

The illumination area varies and depends on the illumination overfill. The total illumination area on the DMD is the array area and overfill area around the array. The optical model is used to determine the percent of the total illumination on the DMD that is outside the array (OV_{ILL}) and the percent of the total illumination that is on the active array. From these values the illumination area (A_{ILL}) is calculated. The illumination is assumed to be uniform across the entire array.

From the measured illumination spectrum, the ratio of the optical power in the wavelength bands of interest to the total optical power is calculated.

Sample calculation:

$Q_{INCIDENT}$ = 5.9 W (measured)

A_{ARRAY} = (0.73872 × 0.41472) = 0.3064 cm^2 (data sheet)

OV_{ILL} = 16.3% (optical model)

$OP_{UV-RATIO}$ = 0.00021 (spectral measurement)

$OP_{VIS-RATIO}$ = 0.99977 (spectral measurement)

$OP_{IR-RATIO}$ = 0.00002 (spectral measurement)

$OP_{BLU-RATIO}$ = 0.28100 (spectral measurement)

$OP_{BLU1-RATIO}$ = 0.03200 (spectral measurement)

$A_{ILL} = 0.3064 \div (1 - 0.163) = 0.3660 \text{ cm}^2$

$ILL_{UV} = [0.00021 \times 5.90W] \times 1000 \div 0.3660 \text{ cm}^2 = 3.385 \text{ mW/cm}^2$

$ILL_{VIS} = [0.99977 \times 5.90W] \div 0.3660 \text{ cm}^2 = 16.12 \text{ W/cm}^2$

$ILL_{IR} = [0.00002 \times 5.90W] \times 1000 \div 0.3660 \text{ cm}^2 = 0.322 \text{ mW/cm}^2$

$ILL_{BLU} = [0.28100 \times 5.90W] \div 0.3660 \text{ cm}^2 = 4.53 \text{ W/cm}^2$

$ILL_{BLU1} = [0.03200 \times 5.90W] \div 0.3660 \text{ cm}^2 = 0.52 \text{ W/cm}^2$

7.8 Micromirror Landed-On/Landed-Off Duty Cycle

7.8.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the amount of time (as a percentage) that an individual micromirror is landed in the ON state versus the amount of time the same micromirror is landed in the OFF state.

As an example, a landed duty cycle of 75/25 indicates that the referenced pixel is in the ON state 75% of the time and in the OFF state 25% of the time, whereas 25/75 would indicate that the pixel is in the ON state 25% of the time. Likewise, 50/50 indicates that the pixel is ON 50% of the time and OFF 50% of the time.

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) nominally add to 100.

7.8.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD's micromirror array (also called the active array) to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD's usable life.

It is the symmetry and asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

7.8.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD Temperature and Landed Duty Cycle interact to affect the DMD's usable life, and this interaction can be exploited to reduce the impact that an asymmetrical Landed Duty Cycle has on the DMD's usable life. This is quantified in the de-rating curve shown in 図 6-1. The importance of this curve is that:

- All points along this curve represent the same usable life.
- All points above this curve represent lower usable life (and the further away from the curve, the lower the usable life).
- All points below this curve represent higher usable life (and the further away from the curve, the higher the usable life).

In practice, this curve specifies the Maximum Operating DMD Temperature that the DMD should be operated at for a given long-term average Landed Duty Cycle.

7.8.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the nominal landed duty cycle of a given pixel is determined by the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel will experience very close to a 100/0 landed duty cycle during that time period. Likewise, when displaying pure-black, the pixel will experience very close to a 0/100 landed duty cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the landed duty cycle tracks one-to-one with the gray scale value, as shown in 表 7-1.

表 7-1. Grayscale Value and Landed Duty Cycle

Grayscale Value	Nominal Landed Duty Cycle
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20
90%	90/10
100%	100/0

Accounting for color rendition (but still ignoring image processing) requires knowing both the color intensity (from 0% to 100%) for each constituent primary color (red, green, and/or blue) for the given pixel as well as the color cycle time for each primary color, where "color cycle time" is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

During a given period of time, the landed duty cycle of a given pixel can be calculated as follows:

Landed Duty Cycle = (Red_Cycle_% × Red_Scale_Value) + (Green_Cycle_% × Green_Scale_Value) + (1)
(Blue_Cycle_%×Blue_Scale_Value)

where

Red_Cycle_%, Green_Cycle_%, and Blue_Cycle_% represent the percentage of the frame time that Red, Green, and Blue are displayed (respectively) to achieve the desired white point.

For example, assume that the red, green and blue color cycle times are 50%, 20%, and 30% respectively (in order to achieve the desired white point), then the Landed Duty Cycle for various combinations of red, green, blue color intensities would be as shown in 表 7-2.

表 7-2. Example Landed Duty Cycle for Full-Color Pixels

| Red Cycle Percentage	Green Cycle Percentage	Blue Cycle Percentage
50%	20%	30%

Red Scale Value	Green Scale Value	Blue Scale Value	Nominal Landed Duty Cycle
0%	0%	0%	0/100
100%	0%	0%	50/50
0%	100%	0%	20/80
0%	0%	100%	30/70
12%	0%	0%	6/94
0%	35%	0%	7/93
0%	0%	60%	18/82

English Data Sheet: DLPS124

Red Scale Value	Green Scale Value	Blue Scale Value	Nominal Landed Duty Cycle
100%	100%	0%	70/30
0%	100%	100%	50/50
100%	0%	100%	80/20
12%	35%	0%	13/87
0%	35%	60%	25/75
12%	0%	60%	24/76
100%	100%	100%	100/0

The last factor to account for in estimating the Landed Duty Cycle is any applied image processing. Within the DLP Controller DLPC3437, the two functions which affect Landed Duty Cycle are Gamma and IntelliBright™.

Gamma is a power function of the form Output_Level = A × Input_Level^{Gamma}, where A is a scaling factor that is typically set to 1.

In the DLPC3430/DLPC3435 controller, gamma is applied to the incoming image data on a pixel-by-pixel basis. A typical gamma factor is 2.2, which transforms the incoming data as shown in 図 7-2.
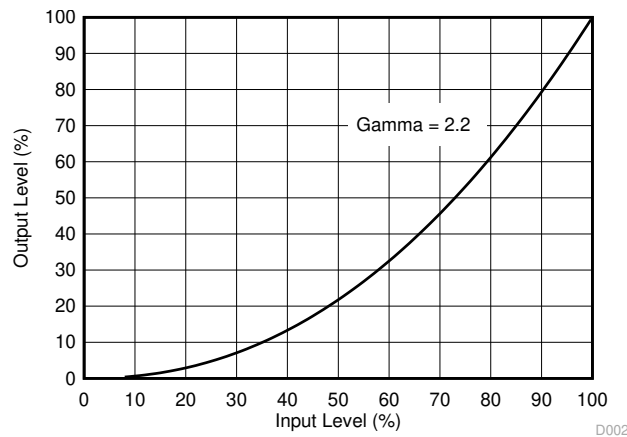

図 7-2. Example of Gamma = 2.2

From 図 7-2, if the gray scale value of a given input pixel is 40% (before gamma is applied), then gray scale value will be 13% after gamma is applied. Therefore, it can be seen that since gamma has a direct impact displayed gray scale level of a pixel, it also has a direct impact on the landed duty cycle of a pixel.

The IntelliBright algorithms content adaptive illumination control (CAIC) and local area brightness boost (LABB) also apply transform functions on the gray scale level of each pixel.

But while the amount of gamma applied to every pixel (of every frame) is constant (the exponent, gamma, is constant), CAIC and LABB are both adaptive functions that can apply a different amounts of either boost or compression to every pixel of every frame.

Consideration must also be given to any image processing which occurs before the DLPC3437 controller.

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions, with the primary direction being into a projection or collection optic. Each application is derived primarily from the optical architecture of the system and the format of the data coming into the dual DLPC3437 controllers. The new high tilt pixel in the side-illuminated DMD increases brightness performance and enables a smaller system footprint for thickness constrained applications. Applications of interest include projection embedded in display devices like battery powered mobile accessory full HD projectors, battery powered smart full HD projectors, digital signage, interactive surface projection, low latency gaming displays, interactive displays, and wearable displays.

DMD power-up and power-down sequencing is strictly controlled by the DLPA3000/DLPA3005. Refer to セクション 9 for power-up and power-down specifications. To ensure reliable operation, the DLP3310 DMD must always be used with two DLPC3437 controllers and a DLPA3000/DLPA3005 PMIC/LED driver.

8.2 Typical Application

A common application when using a DLP3310 DMD and two DLPC3437s is for creating a pico-projector that can be used as an accessory to a smartphone, tablet or a laptop. The two DLPC3437s in the pico-projector receive images from the XC7Z020-1CLG484I4493 FPGA, which receives images from a multimedia front end within the product as shown in 図 8-1.
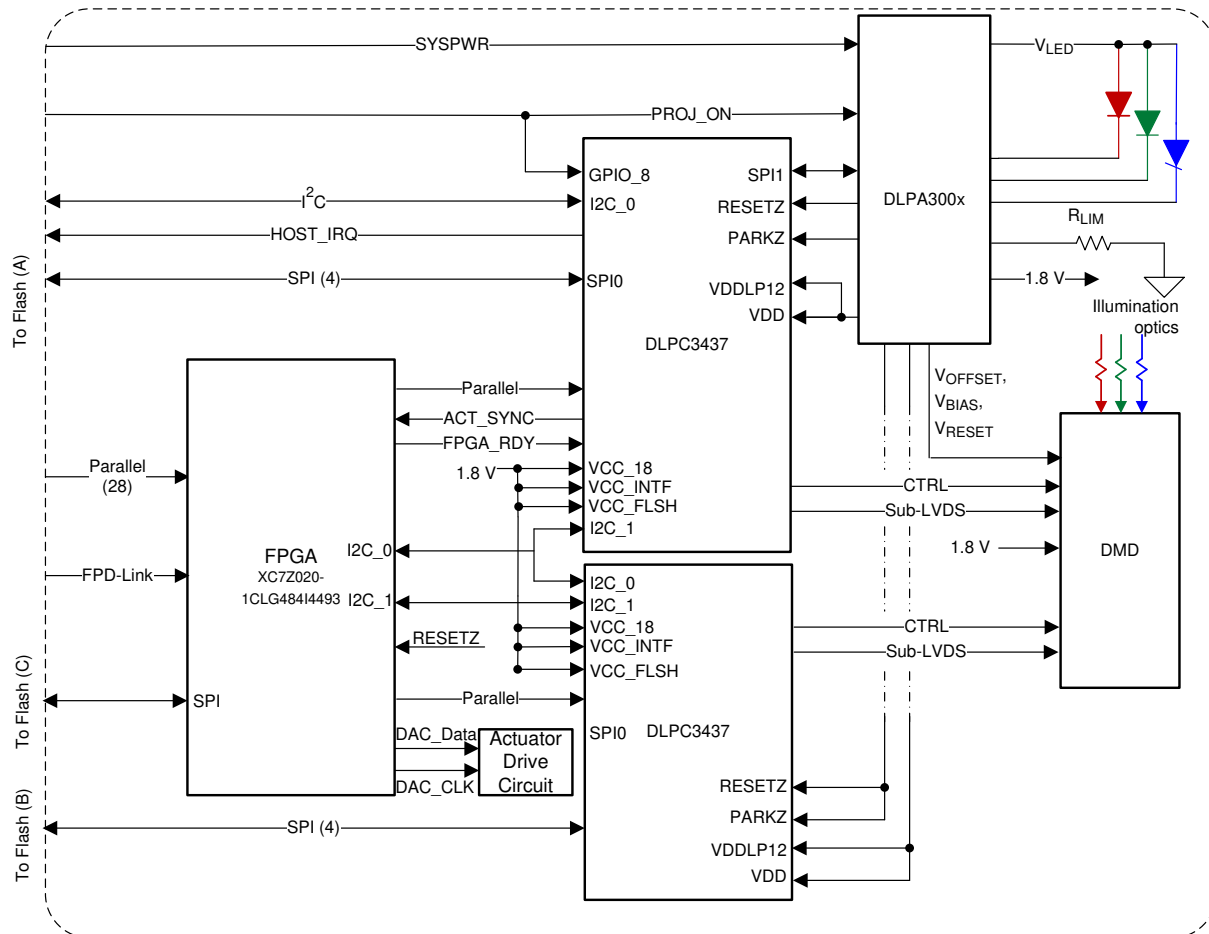

図 8-1. Typical Application Diagram

8.2.1 Design Requirements

A pico-projector is created by using a DLP chip set comprised a DLP3310 DMD, two DLPC3437 controllers, a XC7Z020-1CLG484I4493 FPGA, and a DLPA3000/DLPA3005 PMIC/LED driver. The XC7Z020-1CLG484I4493 FPGA and DLPC3437 controllers do the digital image processing, the DLPA3000/DLPA3005 provides the needed analog functions for the projector, and the DLP3310 DMD is the display device for producing the projected image.

In addition to the three DLP chips in the chip set, other chips are needed. At a minimum a Flash part is needed to store the software and firmware to control the XC7Z020-1CLG484I4493 FPGA, and each of the DLPC3437 controllers.

The illumination light that is applied to the DMD is typically from red, green, and blue LEDs. These are often contained in three separate packages, but sometimes more than one color of LED die may be in the same package to reduce the overall size of the pico-projector.

For connecting the XC7Z020-1CLG484I4493 FPGA to the multimedia front end for receiving images, either a 24-bit parallel interface can be used, or the dual FPD-Link interface can be used. An I^2C interface should be connected from the multimedia front end for sending commands to one of the DLPC3437 controllers for configuring the chipset for different features.

8.2.2 Detailed Design Procedure

For connecting together the XC7Z020-1CLG484I4493 FPGA, the two DLPC3437 controllers, the DLPA3000/ DLPA3005, and the DLP3310 DMD, see the reference design schematic. When a circuit board layout is created from this schematic a very small circuit board is possible. An example small board layout is included in the reference design data base. Layout guidelines should be followed to achieve a reliable projector.

The optical engine that has the LED packages and the DMD mounted to it is typically supplied by an optical OEM who specializes in designing optics for DLP projectors.

8.2.3 Application Curve

As the LED currents that are driven time-sequentially through the red, green, and blue LEDs are increased, the brightness of the projector increases. This increase is somewhat non-linear, and the curve for typical white screen lumens changes with LED currents is as shown in 図 8-2. For the LED currents shown, it's assumed that the same current amplitude is applied to the red, green, and blue LEDs.
図 8-2. Luminance vs Current

9 Power Supply Recommendations

The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, and V_{RESET}. All V_{SS} connections are also required. DMD power-up and power-down sequencing is strictly controlled by the DLPA3000/DLPA3005 devices.

注意

For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to the prescribed power-up and power-down procedures may affect device reliability.

V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, and V_{RESET} power supplies have to be coordinated during power-up and power-down operations. Failure to meet any of the below requirements will result in a significant reduction in the DMD's reliability and lifetime. Refer to 図 9-2. V_{SS} must also be connected.

9.1 Power Supply Power-Up Procedure

• During power-up, V_{DD} and V_{DDI} must always start and settle before V_{OFFSET}, V_{BIAS}, and V_{RESET} voltages are applied to the DMD.
• During power-up, it is a strict requirement that the delta between V_{BIAS} and V_{OFFSET} must be within the specified limit shown in *Recommended Operating Conditions*. Refer to 表 9-1 and the *Layout Example* for power-up delay requirements.
• During power-up, the DMD's LPSDR input pins shall not be driven high until after V_{DD} and V_{DDI} have settled at operating voltage.
• During power-up, there is no requirement for the relative timing of V_{RESET} with respect to V_{OFFSET} and V_{BIAS}. Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements listed previously and in 図 9-1.

9.2 Power Supply Power-Down Procedure

• Power-down sequence is the reverse order of the previous power-up sequence. V_{DD} and V_{DDI} must be supplied until after V_{BIAS}, V_{RESET}, and V_{OFFSET} are discharged to within 4 V of ground.
• During power-down, it is not mandatory to stop driving V_{BIAS} prior to V_{OFFSET}, but it is a strict requirement that the delta between V_{BIAS} and V_{OFFSET} must be within the specified limit shown in *Recommended Operating Conditions* (Refer to Note 2 for 図 9-1).
• During power-down, the DMD's LPSDR input pins must be less than V_{DDI}, the specified limit shown in *Recommended Operating Conditions*.
• During power-down, there is no requirement for the relative timing of V_{RESET} with respect to V_{OFFSET} and V_{BIAS}.
• Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements listed previously and in 図 9-1.

9.3 Power Supply Sequencing Requirements
A. Refer to 表 9-1 and 図 9-2 for critical power-up sequence delay requirements.

B. To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{OFFSET}|$ must be less than specified in *Recommended Operating Conditions*. OEMs may find that the most reliable way to ensure this is to power V_{OFFSET} prior to V_{BIAS} during power-up and to remove V_{BIAS} prior to V_{OFFSET} during power-down. Refer to 表 9-1 and 図 9-2 for power-up delay requirements.

C. To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{RESET}|$ must be less than specified limit shown in *セクション 6.4*.

D. When system power is interrupted, the DLPA3000/DLPA3005 initiates hardware power-down that disables V_{BIAS}, V_{RESET} and V_{OFFSET} after the Micromirror Park Sequence.

E. Drawing is not to scale and details are omitted for clarity.

図 9-1. Power Supply Sequencing Requirements (Power Up and Power Down)

表 9-1. Power-Up Sequence Delay Requirement

PARAMETER		MIN	MAX	UNIT
t_{DELAY}	Delay requirement from V_{OFFSET} power up to V_{BIAS} power up	2		ms
V_{OFFSET}	Supply voltage level at beginning of power–up sequence delay (see 図 9-2)		6	V

表 9-1. Power-Up Sequence Delay Requirement (continued)

PARAMETER		MIN	MAX	UNIT
V_{BIAS}	Supply voltage level at end of power–up sequence delay (see 図 9-2)		6	V
Refer to 表 9-1 for V_{OFFSET} and V_{BIAS} supply voltage levels during power-up sequence delay.

10 Layout

10.1 Layout Guidelines

The DLP3310 DMD is connected to a PCB or a Flex circuit using an interposer. For additional layout guidelines regarding length matching, impedance, etc. see the DLPC3437 controller datasheet. For a detailed layout example refer to the layout design files. Some layout guidelines for routing to the DLP3310 DMD are:

- Match lengths for the LS_WDATA and LS_CLK signals.
- Minimize vias, layer changes, and turns for the HS bus signals. Refer to 図 10-1.
- Minimum of two 220-nF (35 V) capacitors - one close to V_{BIAS} pin. Capacitors C10 and C14 in 図 10-1.
- Minimum of two 220-nF (35 V) capacitors - one close to each V_{RST} pin. Capacitors C11 and C13 in 図 10-1.
- Minimum of two 220-nF (35 V) capacitors - one close to each V_{OFS} pin. Capacitors C4 and C12 in 図 10-1.
- Minimum of four 220-nF (10 V) capacitors - two close to each side of the DMD. Capacitors C1, C3, C2, and C5 in 図 10-1.

English Data Sheet: DLPS124

PACKAGE OPTION ADDENDUM

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLP3310AFQM	ACTIVE	CLGA	FQM	92	100	RoHS & Green	NI/AU	N / A for Pkg Type	0 to 70		Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
