TEXAS INSTRUMENTS
DRV8714-Q1, DRV8718-Q1
JAJSKV6D – AUGUST 2020 – REVISED APRIL 2024

DRV871x-Q1 広い同相入力電圧範囲を持つインライン電流検出アンプを備えた車載用マルチチャネル・スマート・ハーフブリッジ・ゲート・ドライバ

1 特長

- 車載アプリケーション用に AEC-Q100 認定済み:
  - 温度グレード 1:-40℃～+125℃、T_A
- マルチチャネル ハーフブリッジ ゲートドライバ
  - ピン互換のハーフブリッジ ドライバ (x4、x8) バリアント
  - 4.9V～37V (絶対最大定格 40V) 動作範囲
  - 出力マッピング機能を搭載した 4 個の PWM 入力
  - 100% PWM に対応するトリプラー チャージ ポンプ
  - ハーフブリッジ、H ブリッジ、SPI の各制御モード
- スマート多段ゲートドライブ アーキテクチャ
  - 調整可能なスルー レート制御
  - 適応型伝搬遅延制御
  - 50μA～62mA のピーク ソース電流出力
  - 50μA～62mA のピーク シンク電流出力
  - デッドタイム ハンドシェイクを集積
- 同相範囲の広い 2 個の電流シャント アンプ
  - インライン、ハイサイド、またはローサイドをサポート
  - 可変ゲイン設定 (10、20、40、80V/V)
- 複数のインターフェイス オプションを利用可能
  - SPI:詳細な構成と診断
  - H/W:制御ピンの簡素化とマイコン (MCU) ピンの削減
- コンパクトな VQFN パッケージ (ウェッタブル フランク)
- 保護機能内蔵
  - 専用のドライバ ディスエーブル ピン (DRVOFF)
  - 低 I_Q、スリープ モード モーター ブレーキ (BRAKE)
  - 電源 / レギュレータ電圧監視
  - MOSFET V_{DS} 過電流監視
  - MOSFET V_{GS} ゲート フォルト監視
  - 反転極性 MOSFET 用チャージ ポンプ
  - オフライン オープン負荷と短絡診断
  - デバイス熱警告とシャットダウン
  - ウィンドウ ウォッチドッグ タイマ
  - フォルト状況割り込みピン (nFAULT)

2 アプリケーション

- 車載用ブラシ付き DC モーター
- パワー・シート・モジュール
- パワー・トランクとリフト・ゲート
- ドア・モジュール
- 車体制御モジュール
- 電動サンルーフ
- トランスミッションおよびエンジン制御モジュール

3 概要

DRV871x-Q1 デバイス ファミリは、複数のモーターまたは負荷を駆動するための高集積マルチチャネル ゲート ドライバです。これらのデバイスは 4 つ (DRV8714-Q1) または 8 つ (DRV8718-Q1) のハーフブリッジ ゲート ドライバ、ドライバ電源、電流シャント アンプ、保護モニタを内蔵しており、システム全体の複雑さ、サイズ、コストを低減します。

スマート ゲート ドライブ アーキテクチャは、デッドタイムを管理して貫通電流を防止し、スルーレートを制御して電磁干渉 (EMI) を低減し、伝搬遅延を最適化して性能を向上させます。

ハーフブリッジまたは H ブリッジを独立して制御するための入力モードが備わっています。SPI 制御機能と組み合わせて、4 個の PWM 入力を複数のドライバの間でマルチプレクス (多重化) することができます。

広同相シャント アンプにより、インライン電流検出機能が実現し、ウィンドウの再循環中であっても、モーター電流を連続的に測定できます。インライン検出が必要ない場合は、ローサイドまたはハイサイドのセンス構成でアンプを使用できます。

本デバイスは、一連の保護機能を搭載しており、信頼性の高いシステム動作に貢献します。これらの保護機能には、低電圧監視と過電圧監視、外部 MOSFET の V_{DS} 過電流監視と V_{GS} ゲート障害監視、オフライン オープン負荷および短絡の診断、内部的な温度警告と過熱保護機能があります。

製品情報 (1)

部品番号	パッケージ	本体サイズ (公称)
DRV8714-Q1	VQFN (40)	6.00mm x 6.00mm
	HTQFP (48)	7.00mm x 7.00mm
	VQFN (56)	8.00mm x 8.00mm
DRV8718-Q1	VQFN (56)	8.00mm x 8.00mm

(1) 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。

4 Device Comparison Table

DEVICE	HALF-BRIDGES	AMPLIFIERS	INTERFACE	PACKAGE	PINS
DRV8714H-Q1	4	2	Hardware (H/W)	6x6mm VQFN	40
				7x7mm HTQFP	48
DRV8714S-Q1(1)	4	2	Serial (SPI)	6x6mm VQFN	40
				7x7mm HTQFP	48
				8x8mm VQFN	56
DRV8718S-Q1	8	2	Serial (SPI)	8x8mm VQFN	56

(1) The DRV8714A-Q1 (DRV8714SAQRHARQ1) is a variant of the DRV8714S-Q1 in the 6x6mm VQFN 40 pin package. The only electrical or functional difference is the change of the V_{POB_VDS} electrical threshold to 800mV.

表 4-1. DRV8714-Q1 SPI vs. H/W Feature Comparison

Feature	DRV8714S-Q1 SPI Interface	DRV8714H-Q1 H/W Interface
PWM Input Mode	4 Modes	4 Modes
Gate Drive Output Current (I_{DRIVE})	16 Settings	6 Settings
Dead Time	Handshake + 3 Fixed Settings	Handshake Only
V_{DS} Comparator Threshold	16 Settings	6 Settings
V_{DS} and V_{GS} Blanking Time (t_{DRIVE})	8 Settings	Fixed, 8µs
V_{DS} Deglitch Time	4 Settings	Fixed, 4µs
V_{GS} Deglitch Time	Fixed, 2µs	Fixed, 2µs
V_{DS} Fault Response	4 Modes	Fixed, Cycle-By-Cycle
V_{GS} Fault Response	4 Modes	Fixed, Cycle-By-Cycle
Amplifier Gain	4 Settings	4 Settings
Amplifier Blanking Time	8 Settings	N/A
Amplifier Reference Voltage	2 Settings	Fixed, V_{AREF} / 2
V_{PVDD} Undervoltage Fault Response	2 Modes	Auto Retry
V_{PVDD} Overvoltage Fault Response	4 Modes	N/A
V_{VCP} Undervoltage Fault Response	2 Modes	Auto Retry
V_{VCP} Undervoltage Threshold	2 Settings	Fixed, 2.5V
Offline Open Load Diagnostic	Available	N/A
Offline Short Circuit Diagnostic	Available	N/A
Watchdog Timer	Available	N/A
Multi-Function DRVOFF/nFLT Pin	Configurable DRVOFF or nFLT	nFLT Fault Report Only

表 5-1. VQFN (RVJ) 56-Pin Package Pin Functions

PIN			I/O	TYPE	DESCRIPTION
NO.	NAME				
	DRV8718S-Q1	DRV8714S-Q1			
1	SCLK		I	Digital	Serial clock input. Serial data is shifted out and captured on the corresponding rising and falling edge on this pin. Internal pulldown resistor.
2	SDI		I	Digital	Serial data input. Data is captured on the falling edge of the SCLK pin. Internal pulldown resistor.
3	SDO		O	Digital	Serial data output. Data is shifted out on the rising edge of the SCLK pin. Push-pull output.
4	IN1	IN1/EN1	I	Digital	Half-bridge and H-bridge control input. See セクション 7.3.3. Internal pulldown.
5	IN2	IN2/PH1	I	Digital	
6	IN3	IN3/EN2	I	Digital	
7	IN4	IN4/PH2	I	Digital	
8	nSLEEP		I	Digital	Device enable pin. Logic low to shutdown the device and enter sleep mode. Internal pulldown resistor.
9	DRVOFF/nFLT		I/O	Digital	Multi-function pin for either driver shutdown input or fault indicator output. See セクション 7.3.8. Internal pulldown resistor.
10	AREF		I	Power	External voltage reference and power supply for current sense amplifiers. Recommended to connect a 0.1µF, 6.3V ceramic capacitor between the AREF and AGND pins.
11	AGND		I/O	Power	Device ground. Connect to system ground.
12	SO1		O	Analog	Shunt amplifier output.
13	SO2		O	Analog	Shunt amplifier output.
14	BRAKE		I	Digital	Powered off braking pin. Logic high to enable low-side gate drivers while in low-power sleep mode. See セクション 7.3.8.2. Internal pulldown resistor.
15	SP1		I	Analog	Amplifier positive input. Connect to positive terminal of the shunt resistor.
16	SN1		I	Analog	Amplifier negative input. Connect to negative terminal of the shunt resistor.
17	SP2		I	Analog	Amplifier positive input. Connect to positive terminal of the shunt resistor.
18	SN2		I	Analog	Amplifier negative input. Connect to negative terminal of the shunt resistor.
19	GL1	NC	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
20	SH1	NC	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
21	GH1	NC	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
22	GH2	GH1	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
23	SH2	SH1	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
24	GL2	GL1	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
25	PGND1		I	Analog	Low-side MOSFET gate drive 1-4 sense and power return. Connect to system ground close to the device and half-bridge 1-4.
26	GL3	GL2	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
27	SH3	SH2	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
28	GH3	GH2	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
29	GH4	NC	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
30	SH4	NC	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
31	GL4	NC	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
32	GND		I/O	Ground	Device ground. Connect to system ground.
33	CP2L		I/O	Power	Charge pump switching node. Connect a 100nF, PVDD-rated ceramic capacitor between the CP2H and CP2L pins.
34	CP2H		I/O	Power	
35	CP1L		I/O	Power	Charge pump switching node. Connect a 100nF, PVDD-rated ceramic capacitor between the CP1H and CP1L pins.
36	CP1H		I/O	Power

PIN			I/O	TYPE	DESCRIPTION
NO.	NAME				
	DRV8718S-Q1	DRV8714S-Q1			
37	VCP		I/O	Power	Charge pump output. Connect a 1µF, 16V ceramic capacitor between the VCP and PVDD pins.
38	PVDD		I	Power	Device driver power supply input. Connect to the bridge power supply. Connect a 0.1µF, PVDD-rated ceramic capacitor and local bulk capacitance greater than or equal to 10µF between PVDD and GND pins.
39	DRAIN		I	Analog	Bridge MOSFET drain voltage sense pin. Connect to common point of the high-side MOSFET drains.
40	NC		—	—	No connection.
41	GL5	NC	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
42	SH5	NC	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
43	GH5	NC	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
44	GH6	GH3	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
45	SH6	SH3	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
46	GL6	GL3	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
47	PGND2		I	Analog	Low-side MOSFET gate drive 5-8 sense and power return. Connect to system ground close to the device and half-bridge 5-8.
48	GL7	GL4	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
49	SH7	SH4	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
50	GH7	GH4	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
51	GH8	NC	O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
52	SH8	NC	I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
53	GL8	NC	O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
54	DGND		I/O	Ground	Device ground. Connect to system ground.
55	DVDD		I	Power	Device logic and digital output power supply input. Recommended to connect a 1.0µF, 6.3V ceramic capacitor between the DVDD and GND pins.
56	nSCS		I	Digital	Serial chip select. A logic low on this pin enables serial interface communication. Internal pullup resistor.

注

The DRV8718-Q1 56-Pin VQFN (RVJ) and DRV8714-Q1 56-Pin VQFN (RVJ) packages are drop in pin-to-pin compatible. Please note that the locations of half-bridges 1,2,3 and 4 are shifted for the DRV8714-Q1 to help with PCB routing.

PIN			I/O	TYPE	DESCRIPTION
NO.	NAME				
	DRV8714S-Q1	DRV8714H-Q1			
1	SDI	—	I	Digital	Serial data input. Data is captured on the falling edge of the SCLK pin. Internal pulldown resistor.
	—	IDRIVE	I	Analog	Gate driver output current setting. 6 level input pin set by an external resistor.
2	SDO	—	O	Digital	Serial data output. Data is shifted out on the rising edge of the SCLK pin. Push-pull output.
	—	MODE	I	Analog	Analog PWM input mode setting. 4 level input pin set by an external resistor.
3	IN1/EN1		I	Digital	Half-bridge and H-bridge control input. See セクション 7.3.3. Internal pulldown.
4	IN2/PH1		I	Digital	
5	IN3/EN2		I	Digital	
6	IN4/PH2		I	Digital	
7	nSLEEP		I	Digital	Device enable pin. Logic low to shutdown the device and enter sleep mode. Internal pulldown resistor.
8	DRVOFF/nFLT	—	I/O	Digital	Multi-function pin for either driver shutdown input or fault indicator output. See セクション 7.3.8. Internal pulldown resistor.
	—	nFLT	O	Digital	Fault indicator output. This pin is pulled logic low to indicate a fault condition. Open-drain output. Requires external pullup resistor.
9	SO1		O	Analog	Shunt amplifier output.
10	SO2		O	Analog	Shunt amplifier output.
11	BRAKE		I	Digital	Powered off braking pin. Logic high to enable low-side gate drivers while in low-power sleep mode. See セクション 7.3.8.2. Internal pulldown resistor.
12	SP1		I	Analog	Amplifier positive input. Connect to positive terminal of the shunt resistor.
13	SN1		I	Analog	Amplifier negative input. Connect to negative terminal of the shunt resistor.
14	SP2		I	Analog	Amplifier positive input. Connect to positive terminal of the shunt resistor.
15	SN2		I	Analog	Amplifier negative input. Connect to negative terminal of the shunt resistor.
16	GH1		O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
17	SH1		I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
18	GL1		O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
19	PGND1		I	Analog	Low-side MOSFET gate drive 1-2 sense and power return. Connect to system ground close to the device and half-bridge 1-2.
20	GL2		O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.
21	SH2		I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
22	GH2		O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
23	CP2L		I/O	Power	Charge pump switching node. Connect a 100nF, PVDD-rated ceramic capacitor between the CP2H and CP2L pins.
24	CP2H		I/O	Power	
25	CP1L		I/O	Power	Charge pump switching node. Connect a 100nF, PVDD-rated ceramic capacitor between the CP1H and CP1L pins.
26	CP1H		I/O	Power	
27	VCP		I/O	Power	Charge pump output. Connect a 1µF, 16V ceramic capacitor between the VCP and PVDD pins.
28	PVDD		I	Power	Device driver power supply input. Connect to the bridge power supply. Connect a 0.1µF, PVDD-rated ceramic capacitor and local bulk capacitance greater than or equal to 10µF between PVDD and GND pins.
29	DRAIN		I	Analog	Bridge MOSFET drain voltage sense pin. Connect to common point of the high-side MOSFET drains.
30	GH3		O	Analog	High-side gate driver output. Connect to the gate of the high-side MOSFET.
31	SH3		I	Analog	High-side source sense input. Connect to the high-side MOSFET source.
32	GL3		O	Analog	Low-side gate driver output. Connect to the gate of the low-side MOSFET.

Ambient temperature, T_A		–40	125	°C
Junction temperature, T_J		–40	150	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) PVDD and DRAIN with respect to GHx, SHx, GLx, or PGNDx should not exceed 40-V. When PVDD or DRAIN are greater than 35-V, negative voltage on GHx, SHx, GLx, and PGNDx should be limited to ensure this rating is not exceeded. When PVDD and DRAIN are less than 35-V, the full negative voltage rating of GHx, SHx, GLx, and PGNDx is available.

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002[1] HBM ESD Classification Level 2		±2000	V
		Charged device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4B	Corner pins	±750	
			Other pins	±500	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{PVDD}	Driver power supply voltage	PVDD	4.9		37	V
I_{HS} (1)	High-side average gate-drive current	GHx	0		15	mA
I_{LS} (1)	Low-side average gate-drive current	GLx	0		15	mA
V_{DVDD}	Digital power supply voltage	DVDD	3		5.5	V
V_{DIN}	Digital input voltage	BRAKE, DRVOFF/nFLT, INx/ENx, INx/PHx, nSLEEP, nSCS, SCLK, SDI	0		5.5	V
I_{DOUT}	Digital output current	SDO	0		5	mA
V_{OD}	Open drain pullup voltage	DRVOFF/nFLT	0		5.5	V
I_{OD}	Open drain output current	DRVOFF/nFLT	0		5	mA
V_{BRAKE}	Brake input voltage	BRAKE	0		PVDD	V
V_{AREF}	Amplfier reference supply voltage	AREF	3		5.5	V
I_{SO}	Shunt amplifier output current	SOx	0		5	mA
T_A	Operating ambient temperature		–40		125	°C
T_J	Operating junction temperature		–40		150	°C

(1) Power dissipation and thermal limits must be observed

6.4 Thermal Information

7 Detailed Description

7.1 Overview

The DRV871x-Q1 family of devices are highly integrated, multi-channel gate drivers intended for driving multiple motors or loads in automotive applications. The devices are tailored for automotive applications by providing a wide array of configuration and control options, MOSFET slew control, MOSFET propagation delay control, and advanced diagnostic and protection functions. The devices provide either 4 (DRV8714-Q1) or 8 (DRV8718-Q1) half-bridge gate drivers, each capable of driving high-side and low-side N-channel power MOSFETs. The DRV871x-Q1 family of devices reduce total system cost by integrating a high number of gate drivers, driver power supples, current shunt amplifiers, and protection monitors.

The DRV871x-Q1 family of devices support a wide array of input PWM control modes. These range from half-bridge control, H-bridge control, and grouped H-bridge control through PWM multiplexing. Recirculation and muxing schemes can be configured through the device SPI interface and input pins. This allows for the device to support different configurations of the outputs such as individual or grouped multiple motor control schemes.

The DRV871x-Q1 devices are based on a smart gate drive architecture (SGD) to reduce system cost and improve reliability. The SGD architecture optimizes dead time to avoid shoot-through conditions, provides flexibility in decreasing electromagnetic interference (EMI) with MOSFET slew rate control through adjustable gate drive current, improves MOSFET propagation delay and matching with an adaptive controller, and protects against drain to source and gate short circuits conditions with V_{DS} and V_{GS} monitors. A strong pulldown circuit helps prevent dV/dt parasitic gate coupling. The external MOSFET slew control is supported through adjustable output gate drivers. The gate driver peak source and sink current can be configured between 0.5-mA and 62-mA with an additional low current mode to achieve gate drive source and sink currents less than 0.5-mA.

The devices can operate with either 3.3-V or 5-V external controllers (MCUs). A dedicated DVDD pins allows for external power to the device digital core and the digital outputs to be referenced to the controller I/O voltage. It communicates with the external controller through an SPI bus to manage configuration settings and diagnostic feedback. The device also has an AREF pin which allows for the shunt amplifier reference voltage to be connected to the reference voltage of the external controller ADC. The shunt amplifier outputs are also clamped to the AREF pin voltage to protect the inputs of the controller from excessive voltage spikes.

The devices provides an array of diagnostic and protection features to monitor system status before operation and protect against faults during system operation. These include under and overvoltage monitors for the power supply and charge pump, V_{DS} overcurrent and V_{GS} gate fault monitors for the external MOSFETs, offline open load and short circuit detection, windowed watchdog timer for SPI and MCI diagnostics, and internal thermal warning and shutdown protection. The current shunt amplifier can be utilized to monitor load current of the system. The high common mode range of the amplifier allows for either inline, high-side, or low-side based shunt resistor current sensing.

Lastly, the device has a unique power off braking function that gives the ability to enables the low-side drivers during the device's low-power sleep mode in case of detecting a system overvoltage condition. This can be utilized to prevent motor back-emf from overcharging the system voltage rail.

7.3 Feature Description

7.3.1 External Components

表 7-1 lists the recommended external components for the device.

表 7-1. Recommended External Components

COMPONENT	PIN 1	PIN 2	RECOMMENDED
C_{PVDD1}	PVDD	GND	0.1-µF, low ESR ceramic capacitor, PVDD-rated.
C_{PVDD2}	PVDD	GND	Local bulk capacitance greater than or equal to 10-µF, PVDD-rated.
C_{DVDD} (1)	DVDD	GND	1.0-µF, 6.3-V, low ESR ceramic capacitor
C_{AREF} (1)	AREF(3)	GND	0.1-µF, 6.3-V, low ESR ceramic capacitor
C_{VCP}	VCP	PVDD	1-µF 16-V, low ESR ceramic capacitor
C_{FLY1}	CP1H	CP1L	0.1-µF, PVDD-rated, low ESR ceramic capacitor
C_{FLY2}	CP2H	CP2L	0.1-µF, PVDD + 16-V, low ESR ceramic capacitor
R_{nFLT}	VCC(2)	nFLT	Pullup resistor, I_{OD} ≤ 5-mA

(1) A local bypass capacitor is recommended to reduce noise on the external low voltage power supply. If another bypass capacitor is within close proximity of the device for the external low voltage power supply and noise on the power supply is minimal, it is optional to remove this component.
(2) VCC is not a pin on the device, but the external low voltage power supply.
(3) On the DRV8714-Q1 RHA package, the AREF pin is not present and the AREF power supply is derived from the DVDD pin.

7.3.2 Device Interface Variants

The DRV8714-Q1 devices support two different interface modes (SPI and hardware) to allow the end application to design for either flexibility or simplicity. The two interface modes share the same four pins, allowing the different versions to be pin to pin compatible. This allows for application designers to evaluate with one interface version and potentially switch to another with minimal modifications to their design. The DRV8718-Q1 device is only available with the SPI interface.

7.3.2.1 Serial Peripheral Interface (SPI)

The DRV8718-Q1 and DRV8714S-Q1 SPI device variants support a serial communication bus that allows for an external controller to send and receive serial data with the driver. This allows for the external controller to configure device settings and read detailed fault information. The interface is a four wire serial interface utilizing the SCLK, SDI, SDO, and nSCS pins.

- The nSCS pin is the chip select input. A logic low signal on this pin enables SPI communication.
- The SCLK pin is an input which accepts a clock signal to determine when data is captured and propagated on SDI and SDO.
- The SDI pin is the data input
- The SDO pin is the data output. The SDO pin uses a push-pull output structure referenced to the DVDD input.

For more information on the SPI, see the SPI Interface section

7.3.2.2 Hardware (H/W)

The DRV8714H-Q1 hardware interface device variant converts the four SPI pins into four resistor configurable inputs, GAIN, VDS, IDRIVE, and MODE. This allows for the application designer to configure the most commonly used device settings by tying the pin logic high or logic low, or with a simple pullup or pulldown resistor. This removes the requirement for an SPI bus from the external controller. General fault information can still be obtained through the nFAULT pin.

The hardware interface settings are latched on power up of the device. They can reconfigured by putting the device in sleep mode with the nSLEEP pin, changing the setting, and reenabling the device through nSLEEP.

Copyright © 2024 Texas Instruments Incorporated

- The GAIN pin configures the current shunt amplifier gain
- The VDS pin configures the voltage threshold of the V_{DS} overcurrent monitors.
- The IDRIVE pin configures the gate drive current strength.
- The MODE pin configures the PWM input control mode.

For more information on the hardware interface, see the Pin Diagrams section.

7.3.3 Input PWM Control Modes

The DRV8718-Q1 and DRV8714-Q1 support a highly configurable Half-Bridge Control Scheme in order to be adapted for a wide variety of output load configurations and control regulations. This control scheme helps to reduce the number of required PWM channels and pins from the external controller. 4 independent PWM control inputs can be provided to the INx input pins and assigned to any of the output half-bridge drivers. The device internally handles the dead-time generation between high-side and low-side switching so that a single PWM input can be used to control a half-bridge.

Additionally the DRV8714-Q1 supports several other standard control schemes for either H-bridge or solenoid control. These control schemes can be selected through the BRG_MODE register setting on SPI interface devices or MODE pin on H/W interface devices as shown in 表 7-2

表 7-2. DRV8714-Q1 Input PWM Modes

PWM Mode	SPI Interface (BRG_MODE)	H/W Interface (MODE Pin)
Half-Bridge Control	00b	Level 1 - GND
H-Bridge Control	01b (PH/EN)	Level 2 (PH/EN) - 47k kΩ
	10b (PWM)	Level 3 (PWM) - Hi-Z
Split HS and LS Control	11b	Level 4 - DVDD

7.3.3.1 Half-Bridge Control Scheme With Input PWM Mapping

7.3.3.1.1 DRV8718-Q1 Half-Bridge Control

The DRV8718-Q1 controls the eight half-bridge gate drivers through a combination of direct PWM, PWM multiplexers, and SPI control registers. The HBx_CTRL (half-bridge control) SPI register is used to control the half-bridge gate driver output state. The different control states for the gate drivers are shown in 表 7-3. Any unused half-bridge drivers should be left disconnected and in the high-impedance (Hi-Z) output state.

The DRV8718-Q1 PWM inputs pins (IN1, IN2. IN3, IN4) can be used to set the PWM frequency and duty cycle for the assigned outputs. If higher frequency or precise duty cycle PWM control is not required, the eight half-bridge gate drivers can also be controlled directly through the HBx_CTRL SPI control register.

The DRV8718-Q1 can also be used to control individual high-side or low-side external MOSFETs instead of a half-bridge. In this setup, simply leave the unused GHx/GLx driver of the half-bridge disconnected. Only passive freewheeling should be utilized if PWM control is needed in this setup.

表 7-3. Half-Bridge SPI Register Control (HBx_CTRL)

HBx_CTRL (1-8)	Gate Driver State	GHx (1-8)	GLx (1-8)	SHx (1-8)
00b	High Impedance (Hi-Z)	L	L	Hi-Z
01b	Drive Low-Side (L)	L	H	L
10b	Drive High-Side (H)	H	L	H
11b	Drive PWM (PWM)	表 7-5	表 7-5	表 7-5

In PWM control mode, the half-bridge gate drivers can be controlled directly by any of 4 independent PWM control inputs (IN1, IN2, IN3, IN4) as shown in 表 7-4.

PWM mapping helps reduce the number of required PWM resources and pins from the external controller when utilizing motor groups or zone control schemes while still allowing for fine PWM frequency and duty cycle control. Each PWM input pin can be mapped to as many half-bridge drivers as desired. The input PWM signal can

Copyright © 2024 Texas Instruments Incorporated

actively drive the high-side or low-side MOSFET of the half-bridge (based on PWMx_HL control register), with the opposite MOSFET in the half-bridge being controlled accordingly based on the freewheeling setting. Either active or passive freewheeling can be configured by the PWMx_FW control register.

The following steps should be taken to modify the PWM mapping scheme during driver operation.

- Set active half-bridge to Hi-Z mode through HBx_CTRL.
- Set new target half-bridge to Hi-Z mode through HBx_CTRL.
- HBx_PWM mapping should be updated from the old target to the new target half-bridge.
- Set new target half-bridge drive MOSFET (PWMx_HL) and freewheeling settings (PWMx_FW).
- Set new target half-bridge to PWM mode through HBx_CTRL.

7.3.3.1.2 DRV8714-Q1 Half-Bridge Control

The DRV8714-Q1 controls the four half-bridge gate drivers through a combination of direct PWM, PWM multiplexers, and SPI control registers. The half-bridge control mode can be enabled by setting BRG_MODE = 00b on SPI interface variants or the MODE pin to level 1 on H/W interface variants. On SPI interface variants, the HBx_CTRL (half-bridge control) SPI register is used to control the half-bridge gate driver output state. The different control states for the gate drivers are shown in 表 7-6. Any unused half-bridge drivers should be left disconnected and in the high-impedance (Hi-Z) output state. On H/W interface variants, the device defaults to direct PWM control from the associated INx/ENx input pins.

The DRV8714-Q1 PWM inputs pins (IN1/EN1, IN2/PH1. IN3/EN2, IN4/PH2) can be used to set the PWM frequency and duty cycle for the assigned output. If high frequency or precise duty cycle PWM control is not required, the four half-bridge gate drivers can be controlled directly through the HBx_CTRL SPI control register on SPI interface variants.

The DRV8714-Q1 can also be used to control individual high-side or low-side external MOSFETs instead of a half-bridge. In this setup, simply leave the unused GHx/GLx driver of the half-bridge disconnected. Only passive freewheeling should be utilized if PWM control is needed in this setup.

表 7-6. Half-Bridge SPI Register Control (HBx_CTRL)

HBx_CTRL (1-4)	Gate Driver State	GHx (1-4)	GLx (1-4)	SHx (1-4)
00b	High Impedance (Hi-Z)	L	L	Hi-Z
01b	Drive Low-Side (L)	L	H	L
10b	Drive High-Side (H)	H	L	H
11b	Drive PWM (PWM)	表 7-8	表 7-8	表 7-8

In PWM control mode, the half-bridge gate drivers can be controlled directly by any of 4 independent PWM control inputs (IN1, IN2, IN3, IN4) as shown in 表 7-4. On H/W interface variants, the PWM control inputs map directly to their associated output number.

PWM mapping helps reduce the number of required PWM resources and pins from the external controller when utilizing motor groups or zone control schemes while still allowing for fine PWM frequency and duty cycle control. Each PWM input pin can be mapped to as many half-bridge drivers as desired. The input PWM signal can actively drive the high-side or low-side MOSFET of the half-bridge (based on PWMx_HL control register), with the opposite MOSFET in the half-bridge being controlled accordingly based on the freewheeling setting. Either active or passive freewheeling can be configured by the PWMx_FW control register. On H/W interface variants, the device is configured for high-side PWM drive with active freewheeling.

The following steps should be taken to modify the PWM mapping scheme during driver operation.

- Set active half-bridge to Hi-Z mode through HBx_CTRL.
- Set new target half-bridge to Hi-Z mode through HBx_CTRL.
- HBx_PWM mapping should be updated from the old target to the new target half-bridge.
- Set new target half-bridge drive MOSFET (PWMx_HL) and freewheeling settings (PWMx_FW).
- Set new target half-bridge to PWM mode through HBx_CTRL.

7.3.3.2 H-Bridge Control

7.3.3.2.1 DRV8714-Q1 H-Bridge Control

In the H-bridge control mode, each two pairs of half-bridge gate drivers can be controlled as an H-bridge gate driver for a total of two H-bridge gate drivers for the DRV8714-Q1. The H-bridge pairs are half-bridges 1 / 2 and 3 / 4 for the DRV8714-Q1. The DRV8714-Q1 can control the 2 H-bridge gate driver pairs through direct inputs pins or SPI control registers. The H-bridge gate drivers have two input control modes that can be configured through the BRG_MODE register setting (01b = PH/EN and 10b = PWM) on SPI interface variants or the MODE pin (Level 2 = PH/EN and Level 3 = PWM) on H/W interface variants. The PH/EN mode allows for the H-bridge to be controlled with a speed/direction type of interface commanded by one PWM signal and one GPIO signal. The PWM mode allows for the H-bridge to be controlled with a more advanced scheme typically requiring two PWM signals. This allows the H-bridge driver to enter four different output states for additional control flexibility if required.

The DRV8714-Q1 PWM inputs pins (IN1/EN1, IN2/PH1, IN3/EN2, IN4/PH2) are used to set the PWM frequency and duty cycle for the assigned output. If PWM control is not required, the two h-bridge gate drivers can be controlled directly through the SPI control registers. The INx/ENx and INx/PHx SPI control can be enabled through the INx/ENx_MODE and INx/PHx_MODE register settings. Each H-bridge can be individually set to Hi-Z through the HIZ register setting.

The default active freewheeling mode is active low-side. The DRV8714-Q1 SPI interface variants provide the ability to configure the freewheeling state through the FW register setting. This setting can be utilized to modify

Copyright © 2024 Texas Instruments Incorporated

the bridge between low-side or high-side active freewheeling. The H/W interface variants default to low-side freewheeling.

The PH/EN control logic and output states for the gate drivers are shown in 表 7-9 and 表 7-10.

7.3.3.3 Split HS and LS Solenoid Control

7.3.3.3.1 DRV8714-Q1 Split HS and LS Solenoid Control

In split HS and LS solenoid control mode, the H-bridge pairs (1 / 2 and 3 / 4) are configured to simplify solenoid control schemes as shown in 図 7-10. This mode allows for the H-bridge to be configured to drive a floating solenoid load between the opposite high-side and low-side external MOSFETs. The solenoid control mode can be enabled by setting the BRG_MODE control register to 11b on SPI interface variants and MODE pin to Level 4 on H/W interface variants..

The high-side MOSFET of the primary half-bridge acts as a HS disconnect switch (controlled through the INx/PHx pin or S_PHx control registers) and the low-side MOSFET of the secondary half-bridge acts as the PWM control for the solenoid (controlled through the INx/ENx pin or S_ENx control register. The INx/ENx and INx/PHx SPI control can be enabled through the INx/ENx_MODE and INx/PHx_MODE register settings. The primary half-bridge low-side MOSFET control is disabled and the secondary half-bridge high-side MOSFET control is disabled. The control truth table is shown in 表 7-13 and 表 7-14.

7.3.4 Smart Gate Driver

The DRV871x-Q1 provides an advanced, adjustable floating smart gate driver architecture to provide fine MOSFET control and robust switching performance. The DRV871x-Q1 provides driver functions for slew rate control and a driver state machine for dead-time handshaking, parasitic dV/dt gate coupling prevention, and MOSFET gate fault detection.

Advanced adaptive drive functions are provided for reducing propagation delay, reducing duty cycle distortion, and closed loop programmable slew time. The advanced smart gate driver functions are only available in the Half-Bridge Control PWM mode and on SPI device variants. The advanced functions do not interfere with standard operation of the gate drivers and can be utilized as needed by system requirements.

The different functions of the smart gate drive architecture are summarized below with additional details in the following sections.

Smart Gate Driver Core Functions:

- Gate Driver Functional Block Diagram
- Slew Rate Control (IDRIVE)
- Gate Driver State Machine (TDRIVE)
- Advanced: Propagation Delay Reduction (PDR)
- Advanced: Duty Cycle Compensation (DCC)
- Advanced: Slew Time Control (STC)

注

The advanced, adaptive drive functions and registers are not required for normal operation of the device and intended for specific system requirements.

表 7-15. Smart Gate Driver Terminology Descriptions

Core Function	Terminology	Description
IDRIVE / TDRIVE	I_{DRVP}	Programmable gate drive source current for adjustable MOSFET slew rate control. Configured with the IDRVP_x control register or IDRIVE pin.
	I_{DRVN}	Programmable gate drive sink current for adjustable MOSFET slew rate control. Configured with the IDRVN_x control register or IDRIVE pin.
	I_{HOLD}	Fixed gate driver hold pull up current during non-switching period.
	I_{STRONG}	Fixed gate driver strong pull down current during non-switching period.
	t_{DRIVE}	$I_{DRVP/N}$ drive current duration before I_{HOLD} or I_{STRONG}. Also provides V_{GS} and V_{DS} fault monitor blanking period. Configured with the VGS_TDRV_x control register.
	t_{PD}	Propagation delay from logic control signal to gate driver output change.
	t_{DEAD}	Body diode conduction period between high-side and low-side switch transition. Configured with the VGS_TDEAD_x control register.

表 7-15. Smart Gate Driver Terminology Descriptions (続き)

Core Function	Terminology	Description
PDR (Pre-charge)	I_{CHR_INIT}	Gate drive source current initial value for charge control loop. Configured with the PRE_CHR_INIT_xx control register
	I_{PRE_CHR}	Gate drive source current for pre-charge period after control loop lock. Adjustment rate configured with the KP_PDR_x control register. Max current clamp configured with the PRE_MAX_x control register.
	t_{PRE_CHR}	Gate drive source current pre-charge period duration. Configured with the T_PRE_CHR_x control register.
	t_{DON}	Delay time from start of pre-charge period to rising V_{SH} crossing V_{SH_L} threshold. Configure with T_DON_DOFF_x control register.
	I_{DCHR_INIT}	Gate drive sink current initial value for discharge period control loop. Configured with the PRE_DCHR_INIT_x control register.
	I_{PRE_DCHR}	Gate drive sink current for pre-discharge period after control loop lock. Adjustment rate configured with the KP_PDR_x control register. Max current clamp configured with the PRE_MAX_x control register.
	t_{PRE_DCHR}	Gate drive sink current pre-discharge period duration. Configured with the T_PRE_DCHR_x control register.
	t_{DOFF}	Delay time from start of pre-discharge period to falling V_{SH} crossing V_{SH_H} threshold. Configure with T_DON_DOFF_x control register.
	V_{SH_L}	Low voltage threshold for V_{SH} switch-node. Configured with the AGD_THR control register.
	V_{SH_H}	High voltage threshold for V_{SH} switch-node. Configured with the AGD_THR control register.
PDR (Post-charge)	I_{PST_CHR}	Gate drive source current for post-charge period. Adjustment rate configured with the KP_PST_x control register.
	t_{PST_CHR}	Gate drive source current post-charge period duration.
	I_{PST_DCHR}	Gate drive sink current for post-discharge period. Adjustment rate configured with the KP_PST_x control register.
	t_{PST_DCHR}	Gate drive source current post-charge period duration.
	I_{FW_CHR}	Freewheeling charge current. Configured with the FW_MAX_x control register.
	I_{FW_DCHR}	Freewheeling discharge current. Configured with the FW_MAX_x control register.
STC	t_{RISE}	Time duration for V_{SHx} to cross from V_{SHx_L} to V_{SHx_H} threshold. Configured with the T_RISE_FALL_x control register.
	t_{FALL}	Time duration for V_{SHx} to cross from V_{SHx_H} to V_{SHx_L} threshold. Configured with the T_RISE_FALL_x control register.

7.3.4.1 Functional Block Diagram

図 7-11 shows a high level function block diagram for the half-bridge gate driver architecture. The gate driver blocks provide a variety of functions for MOSFET control, feedback, and protection. This includes complimentary, push-pull high-side and low-side gate drivers with adjustable drive currents, control logic level shifters, V_{DS}, V_{GS}, and V_{SH} (switch-node) feedback comparators, a high-side Zener clamp, plus passive and active pulldown resistors.

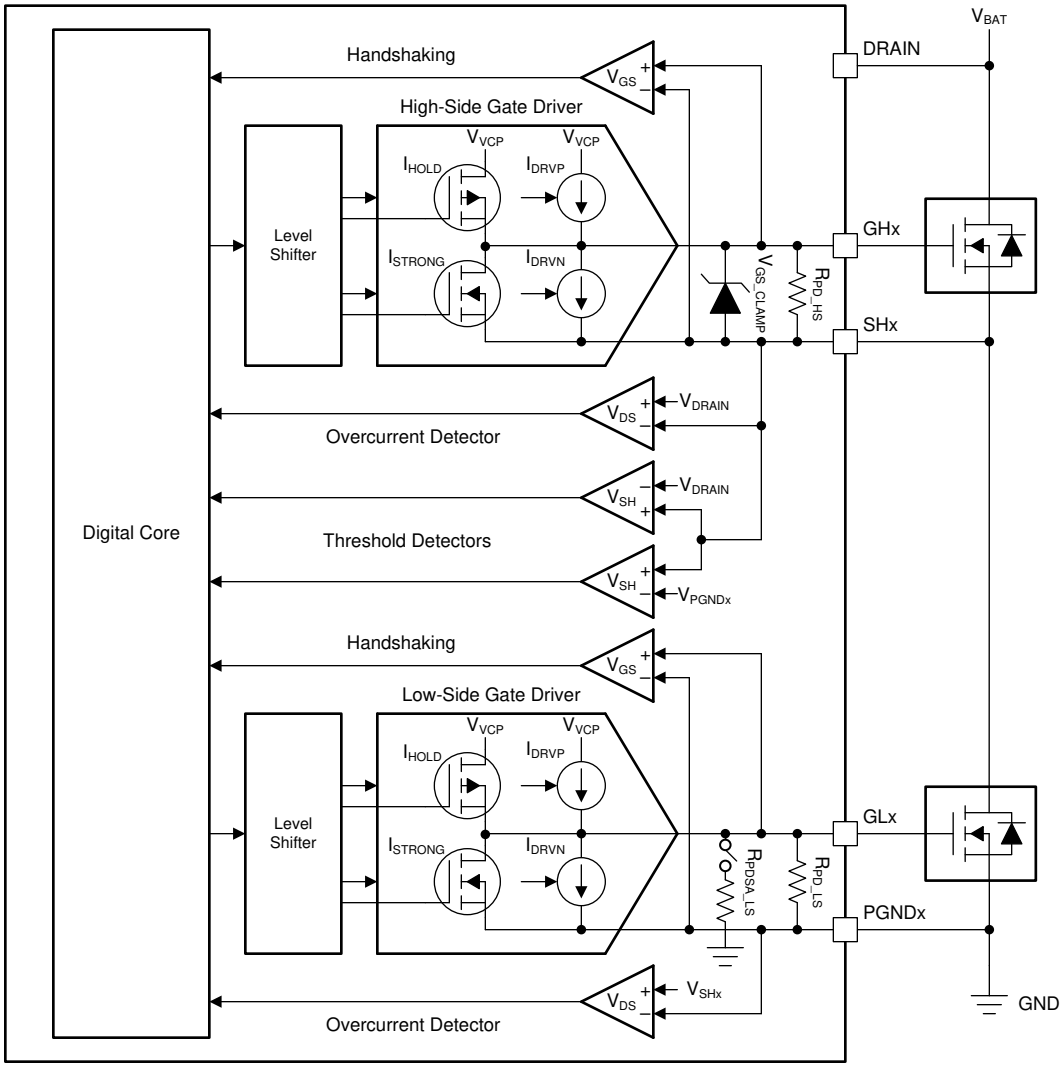

図 7-11. Gate Driver Functional Block Diagram

7.3.4.2 Slew Rate Control (IDRIVE)

The IDRIVE component of the smart gate drive architecture implements adjustable gate drive current control to adjust the external MOSFET V_{DS} slew rate. This is achieved by implementing adjustable pull up (I_{DRVP}) and pull down (I_{DRVN}) current sources for the internal gate driver architecture.

The external MOSFET V_{DS} slew rates are a critical factor for optimizing radiated and conducted emissions, diode reverse recovery, dV/dt parasitic gate coupling, and overvoltage or undervoltage transients on the switch-node of the half-bridge. IDRIVE operates on the principle that the V_{DS} slew rates are predominantly determined by the rate of the gate charge (or gate current) delivered during the MOSFET Q_{GD} or Miller charging region. By allowing the gate driver to adjust the gate current, it can effectively control the slew rate of the external power MOSFETs.

IDRIVE allows the DRV871x-Q1 to dynamically change the gate driver current setting through the IDRVP_x and IDRVN_x SPI registers or IDRIVE pin on H/W interface devices. The device provides 16 settings between the 0.5-mA and 62-mA range for the source and sink currents as shown in 表 7-16. The peak gate drive current is available for the t_{DRIVE} duration. After the MOSFET is switched and the t_{DRIVE} duration expires, the gate driver

Copyright © 2024 Texas Instruments Incorporated

switches to a hold current (I_{HOLD}) for the pull up source current to limit the output current in case of a short circuit condition and to improve the efficiency of the driver.

On SPI interface devices, the IDRV_LOx control register allows for 16 settings <0.5mA if extremely low slew rate control is required.

表 7-16. IDRIVE Source (I_{DRVP}) and Sink (I_{DRVN}) Current

IDRVP_x / IDRVN_x	Gate Source / Sink Current	
	IDRV_LOx = 0b	IDRV_LOx = 1b
0000b	0.5 mA	50 µA
0001b	1 mA	110 µA
0010b	2 mA	170 µA
0011b	3 mA	230 µA
0100b	4 mA	290 µA
0101b	5 mA	350 µA
0110b	6 mA	410 µA
0111b	7 mA	600 µA
1000b	8 mA	725 µA
1001b	12 mA	850 µA
1010b	16 mA	1 mA
1011b	20 mA	1.2 mA
1100b	24 mA	1.4 mA
1101b	31 mA	1.6 mA
1110b	48 mA	1.8 mA
1111b	62 mA	2.3 mA

7.3.4.3 Gate Drive State Machine (TDRIVE)

The TDRIVE component of the smart gate drive architecture is an integrated gate drive state machine that provides automatic dead time insertion, parasitic dV/dt gate coupling prevention, and MOSFET gate fault detection.

The first component of the TDRIVE state machine is an automatic dead time handshake. Dead time is the period of body diode conduction time between the switching of the external high-side and low-side MOSFET to prevent any cross conduction or shoot through. The DRV871x-Q1 uses V_{GS} monitors to implement a break and then make dead time scheme by measuring the external MOSFET V_{GS} voltage to determine when to properly enable the external MOSFETs. This scheme allows the gate driver to adjust the dead time for variations in the system such as temperature drift, aging, voltage fluctuations, and variation in the external MOSFET parameters. An additional fixed digital dead time (t_{DEAD_D}) can be inserted if desired and is adjustable through the SPI registers.

The second component focuses on preventing parasitic dV/dt gate charge coupling. This is implemented by enabling a strong gate current pulldown (I_{STRONG}) whenever the opposite MOSFET in the half-bridge is switching. This feature helps remove parasitic charge that couples into the external MOSFET gate when the half-bridge switch node is rapidly slewing.

The third component implements a gate fault detection scheme to detect an issue with the gate voltage. This is used to detect pin-to-pin solder defects, a MOSFET gate failure, or a gate stuck high or stuck low voltage condition. This is done by using the V_{GS} monitors to measure the gate voltage after the end of the t_{DRIVE} time. If the gate voltage has not reached the proper threshold, the gate driver will report the corresponding fault condition. To ensure a false fault is not detected, a t_{DRIVE} time should be selected that is longer than the time required to charge or discharge the MOSFET gate. The t_{DRIVE} time does not impact the PWM minimum duration and will terminate early if another PWM command is received.

図 7-12. TDRIVE Turn On / Off

7.3.4.4 Propagation Delay Reduction (PDR)

Propagation delay reduction (PDR) control has two primary functions, a pre-charge propagation delay reduction function and a post-charge acceleration function. The PDR control function is only available in the Half-Bridge Control PWM mode and on SPI device variants.

The propagation delay reduction (PDR) primary goal is to reduce the turn on and turn off delay of the external MOSFET by using dynamic pre-charge and pre-discharge currents before the MOSFET Q_{GD} miller region. This can enable the driver to achieve higher and lower duty cycle resolution while still meeting difficult EMI requirements.

The post-charge acceleration function allows for the MOSFET to more quickly reach its low resistive or off state to minimize power losses by increasing the post-charge and post-discharge gate current after the MOSFET Q_{GD} miller region.

An example of the MOSFET pre-charge and post-charge current profiles are shown in 図 7-13. The same control loop is repeated for the MOSFET pre-discharge and post-discharge as shown in 図 7-14. Several examples of the full control loop in different PWM and motor cases are shown in 図 7-15 and 図 7-16.

図 7-13. PDR Charge Profile

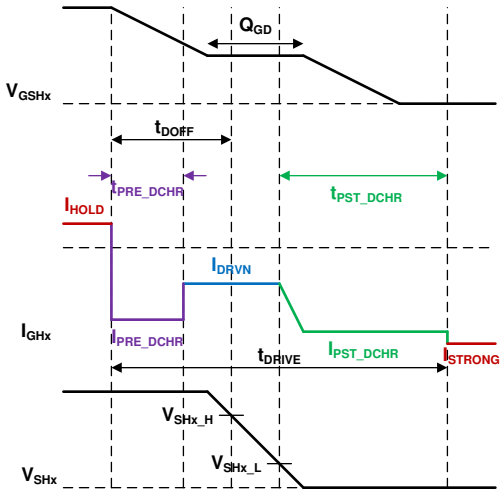

図 7-14. PDR Discharge Profile

7.3.4.4.1 PDR Pre-Charge/Pre-Discharge Control Loop Operation Details

The PDR pre-charge/pre-discharge control loop operates to achieve a user configured turn on and turn off propagation delay (T_DON_DOFF_x) by dynamically adjusting the driver pre-charge (I_{PRE_CHR}) and pre-discharge (I_{PRE_DCHR}) current levels through a proportional gain error controller (KP_PDR_x). The error controller measures the difference in the measured propagation delays (t_{ON}, t_{OFF}) compared to the configured propagation delay (T_DON_DOFF_x) and updates the pre-charge current level for the next switching cycle. The control loop can be operated with the default configuration settings of the device, but full flexibility is provided to configure the timing parameters, initial current levels, error controller strength, and other settings.

7.3.4.4.1.1 PDR Pre-Charge/Pre-Discharge Setup

- Enable the PDR control loop. EN_PDR_x register setting.
- Set the active PWM half-bridge (DRV8718-Q1 only). SET_AGD_x register setting. Note: The advance driver control settings are shared between each half-bridge pair (1/2, 3/4, 5/6, and 7/8) for DRV8718-Q1.
- Set the target t_{ON} and t_{OFF} propagation delay. T_DON_DOFF_x register setting. It is recommended to maintain a value greater than 700 ns to accommodate driver and system delays.
- **Optional Configuration Options:**
  - Adjust initial current values. PRE_CHR_INIT_x, PRE_DCHR_INIT_x register settings.
  - Adjust pre-charge and pre-discharge time duration. T_PRE_CHR_x, T_PRE_DCHR_x register settings.
  - Adjust the proportional gain controller strength. KP_PDR_x register setting.
  - Adjust the maximum current level threshold. PRE_MAX_x, register settings.

Copyright © 2024 Texas Instruments Incorporated

7.3.4.4.2 PDR Post-Charge/Post-Discharge Control Loop Operation Details

The PDR post charge/post-discharge control loop operates by increasing the driver gate current after the MOSFET switching region. This is done by measuring the switch-node voltage (V_{SHx}) and then increasing gate current after crossing the proper threshold. The control loop can be operated with the default configuration settings of the device, but full flexibility is provided to configure the timing parameters, controller strength, and other settings.

7.3.4.4.2.1 PDR Post-Charge/Post-Discharge Setup

- Enable the post-charge/post-discharge control loop. KP_PST_x register setting.
- Set the active PWM half-bridge (DRV8718-Q1 only). SET_AGD_x register setting. Note: The advance driver control settings are shared between each half-bridge pair (1/2, 3/4, 5/6, and 7/8) for DRV8718-Q1.
- **Optional Configuration Options:**
  - Add additional delay before post-charge/post-discharge starts. EN_PST_DLY_xx register setting.
  - Adjust the proportional gain controller strength. KP_PST_x register setting.

7.3.4.4.3 Detecting Drive and Freewheel MOSFET

By default, the PDR loop automatically detects which MOSFET is the drive MOSFET and which MOSFET is the freewheel MOSFET by determining the polarity of the current out of the half-bridge. This is done by measuring the half-bridge V_{SHx} voltage during the dead-time period to determine if the high-side or low-side body diode is conducting. If the current polarity cannot be determined it is assumed that the configured MOSFET through PWMx_HL is the drive MOSFET. The automatic freewheel detection can be disabled with the IDIR_MAN_x control register. In the manual freewheel modes, the PDR loop relies on the PWMx_HL control register to determine which MOSFET is the drive MOSFET and which MOSFET is the freewheel MOSFET. IF PWMx_HL = 0b, the high-side MOSFET is the drive MOSFET and the low-side MOSFET is the freewheel MOSFET. If PWMx_HL = 1b, the low-side MOSFET is the drive MOSFET and high-side MOSFET is the freewheel MOSFET.

図 7-15 shows the high-side MOSFET (HS1) controlling the V_{SHx} switch-node voltage transition and the low-side MOSFET (LS1) acting as the freewheeling MOSFET.

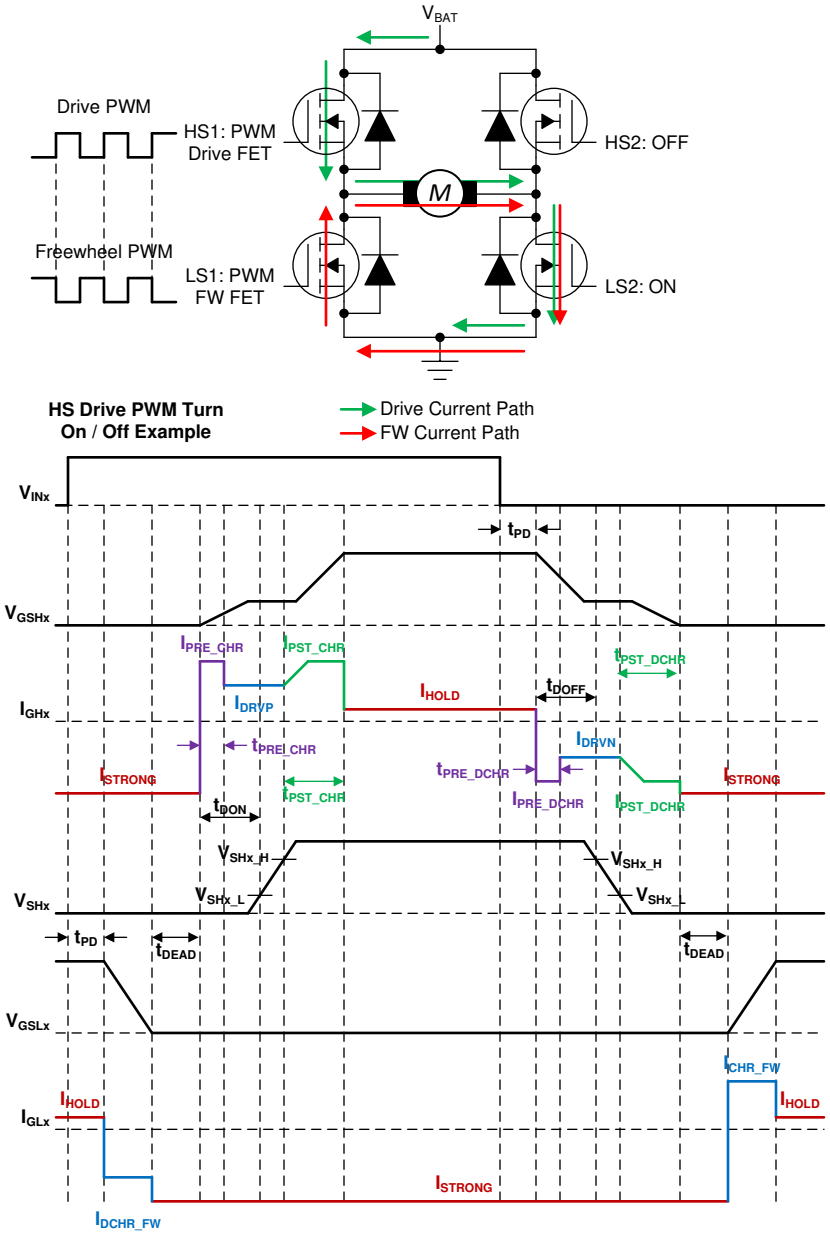

図 7-15. HS Drive PWM Turn On / Off Example

図 7-16 shows the low-side MOSFET (LS2) controlling the V_{SHx} switch-node voltage transition and the high-side MOSFET (HS2) acting as the freewheeling MOSFET.

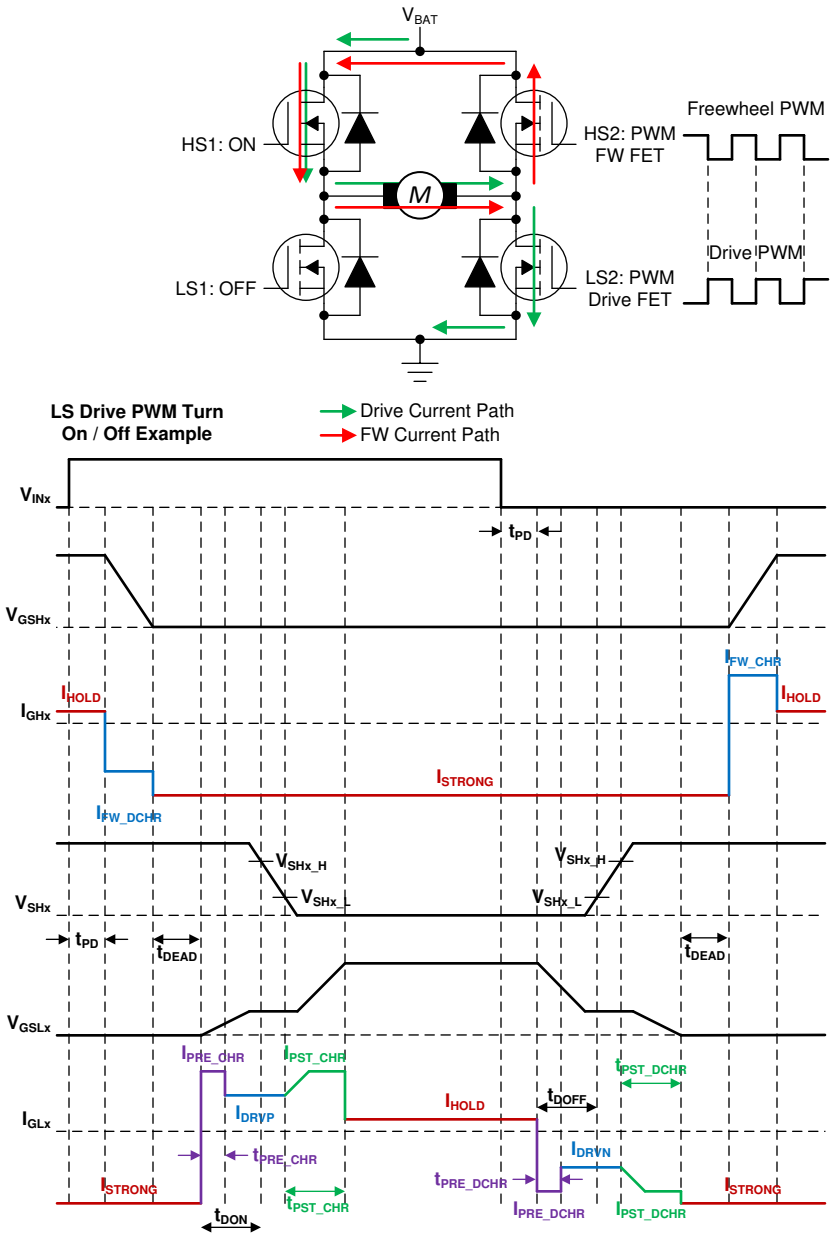

図 7-16. LS Drive PWM Turn On / Off Example

7.3.4.5 Automatic Duty Cycle Compensation (DCC)

The automatic duty cycle compensation (DCC) smart gate driver feature is a function to match the turn on and turn off signals in order to reduce duty cycle distortion that occurs due to different delays in the turn on and turn off sequences. The difference in turn on and turn off delay is introduced by a dependancy on whether the freewheeling MOSFET must be charged or discharged before the V_{SHx} slew can occur. If the freewheeling MOSFET charges or discharges before the drive MOSFET this can introduce a mismatch causing duty cycle

Copyright © 2024 Texas Instruments Incorporated

distortion. The DCC control loop adds an additional delay to match both the turn on and turn off delays. This function can be utilized in the standard drive modes or in combination with the PDR or STC control modes.

The DCC function is enabled through the EN_DCC_xx register setting. Set the active half-bridge that will receive PWM control through the SET_AGD_xx register setting (DRV8718-Q1 only).

7.3.4.6 Closed Loop Slew Time Control (STC)

The slew time control (STC) loop provides the device the ability to configure a specific slew rise and fall time for the output switch-node. The device will adjust the gate drive output current (I_{DRVP} and I_{DRVN}) to meet the desired target settings. This function can be utilized in the standard drive modes or in combination with the PDR or DCC control modes.

7.3.4.6.1 STC Control Loop Setup

- Enable the STC control loop. EN_STC_x register setting
- Set the active PWM half-bridge (DRV8718-Q1 only). SET_AGD_x register setting. Note: The advance driver control settings are shared between each half-bridge pair (1/2, 3/4, 5/6, and 7/8) for DRV8718-Q1.
- Set the target t_{RISE} and t_{FALL} time. T_RISE_FALL_x register setting.
- **Optional Configuration Options:**
- Adjust the proportional gain controller strength. KP_STC_x register setting.

7.3.5 Tripler (Dual-Stage) Charge Pump

The high-side gate drive voltage for the external MOSFET is generated using a tripler (dual-stage) charge pump that operates from the PVDD voltage supply input. The charge pump allows the high-side and low-side gate drivers to properly bias the external N-channel MOSFETs with respect to its source voltage across a wide input supply voltage range. The charge pump output is regulated (V_{VCP}) to maintain a fixed voltage respect to V_{PVDD}. The charge pump is continuously monitored for an undervoltage (V_{CP_UV}) event to prevent under driven MOSFET conditions or in case of a short circuit condition.

The charge pump provides several configuration options. By default the charge pump will automatically switch between tripler (dual-stage) mode and doubler (single-stage) mode after the PVDD pin voltage crosses the V_{CP_SO} threshold in order to reduce power dissipation. On SPI device variants, the charge pump can also be configured to always remain in tripler or doubler mode through the SPI register setting CP_MODE.

The charge pumps requires a low ESR, 1-µF, 16-V ceramic capacitor (X5R or X7R recommended) between the PVDD and VCP pins to act as the storage capacitor. Additionally, a low ESR, 100-nF, PVDD-rated ceramic capacitor (X5R or X7R recommended) is required between the CP1H to CP1L and CP2H to CP2L pins to act as the flying capacitors.

注

Since the charge pump is regulated to the PVDD pin, it should be ensured that the voltage difference between the PVDD pin and MOSFET power supply is limited to a threshold that allows for proper V_{GS} of the external MOSFET during switching operation.

7.3.6 Wide Common-Mode Current Shunt Amplifiers

The DRV871x-Q1 integrates two high-performance, wide common-mode, bidirectional, current-shunt amplifiers for current measurements using shunt resistors in the external half-bridges. Current measurements are commonly used to implement overcurrent protection, external torque control, or commutation with an external controller. Due to the high common-mode range of the shunt amplifier it can support low-side, high-side, or inline shunt configurations. The current shunt amplifiers include features such as programmable gain, unidirectional and bidirectional support, output blanking, and a dedicated voltage reference pin (AREF) to set a mid point bias voltage for the amplifier output. A simplified block diagram is shown in 図 7-17. SPx should connect to the positive terminal of the shunt resistor and SNx should connect to the negative terminal of the shunt resistor. If the amplifiers are not utilized, the AREF, SNx, SPx inputs can be tied to AGND, AGND to PCB GND and the SOx outputs left floating.

Copyright © 2024 Texas Instruments Incorporated

注

It should be noted that in high-side sense configuration there exists a leakage path of approximately 600kΩ to GND when nSLEEP = 0V.

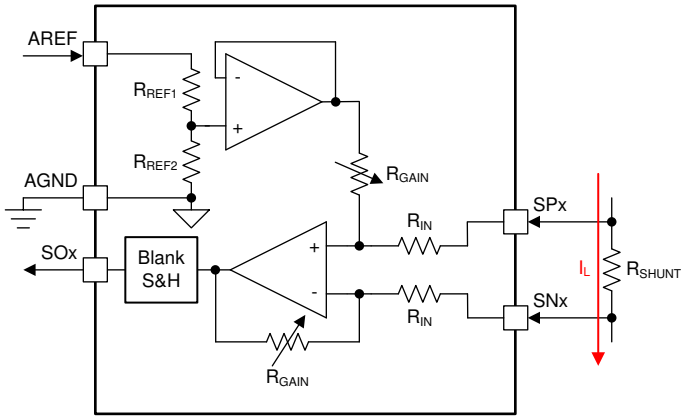

図 7-17. Amplifier Simplified Block Diagram

A detailed block diagram is shown in 図 7-18. The wide common mode amplifier is implemented with a two stage differential architecture. The 1st differential stage supports a wide common mode input, differential output, and has a fixed gain, G = 2. The 2nd differential stage supports a variable gain adjustment, G = 5, 10, 20, or 40. The total gain of the two stages will be G = 10, 20, 40, or 80.

The amplifier can also generate an output voltage bias through the AREF pin. The AREF pin goes to a divider network, a buffer, and then sets the output voltage bias for the differential amplifier. On SPI device variants, the gain is configured through the register setting CSA_GAIN and the reference division ratio through CSA_DIV. On H/W device variants, the reference division ratio is fixed to V_{AREF} / 2. The gain is configured through the GAIN pin.

図 7-18. Amplifier Detailed Block Diagram

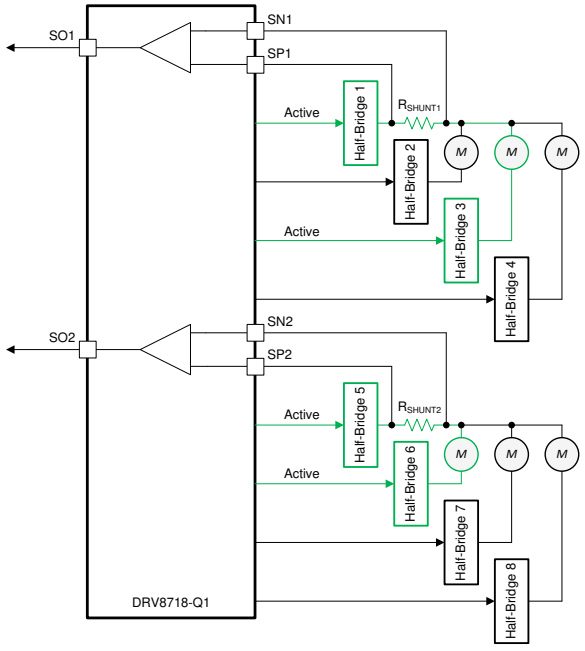

図 7-19. Shared Shunt Resistor

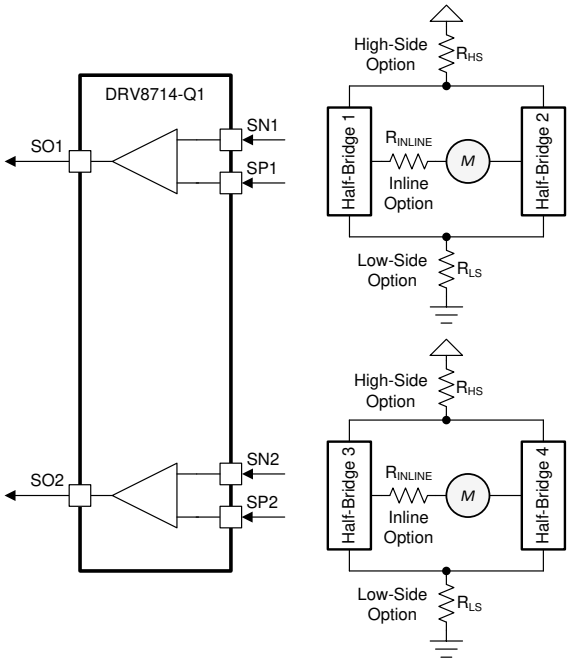

図 7-20. Individual H-Bridge Shunt Resistor

The DRV8718-Q1 inline shunt amplifier can be used to continuously sense motor current even in shared group or zone control configurations. The DRV8714-Q1 provides two shunt amplifiers for the four half-bridge gate drivers allowing for individual H-bridge current sensing if the system requires.

Copyright © 2024 Texas Instruments Incorporated

Lastly, the amplifier has an output blanking switch. This option is only available on SPI device variants. The output switch can be used to disconnect the amplifier output during PWM switching to reduce output noise (blanking). The blanking circuit can be set trigger on the active half-bridge (half-bridge 1-8) through the CSA_BLK_SEL_x register setting. The blanking period can be configured through the CSA_BLK_x register setting. If the gate drivers are transitioning between high-side and low-side FET turn on and turn off or vice versa, the blanking time will extend through the dead-time window to avoid amplifier signal noise if the output swings or noise couples during the dead-time period. An output hold up capacitor is recommended to stabilize the amplifier output when it is disconnected during blanking. Typically this capacitor should be after a series resistor in a RC filter configuration to limit direct capacitance seen directly at the amplifier output. An example of the blanking function is shown in 図 7-21.

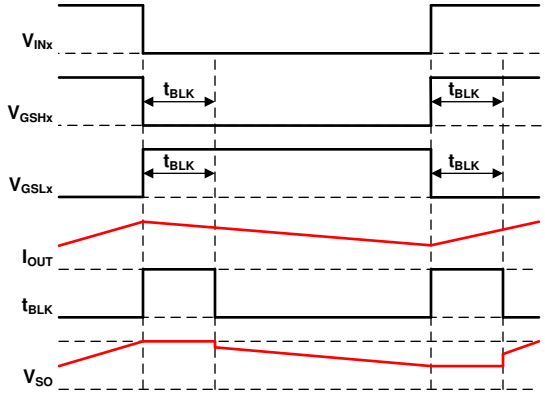

図 7-21. Amplifier Blanking Example

7.3.7 Pin Diagrams

This section presents the I/O structure of all the digital input and output pins.

7.3.7.1 Logic Level Input Pin (INx/ENx, INx/PHx, nSLEEP, nSCS, SCLK, SDI)

7.3.8 Protection and Diagnostics

7.3.8.1 Gate Driver Disable (DRVOFF/nFLT and EN_DRV)

The DRV871x-Q1 provides dedicated driver disable functions with the DRVOFF/nFLT pin and EN_DRV SPI register bit on SPI device variants. When DRVOFF/nFLT or EN_DRV are asserted, all half-bridges will be set Hi-Z by enabling the gate driver pull downs regardless of the other pin or SPI inputs.

Copyright © 2024 Texas Instruments Incorporated

The EN_DRV SPI register bit is provided for a controlled power up sequence. After device power up all the half-bridges remain disabled (all pulldowns active, EN_DRV = 0b) until the EN_DRV register bit is asserted high. This allows for the system to power up and conduct configuration sequences before the gate drivers are enabled. On H/W devices, this functionality is not provided and the driver will automatically enable after power up.

The DRVOFF/nFLT pin provides a direct hardware pin to shutdown the output drivers without relying on an SPI command or PWM input change.

The DRVOFF/nFLT pin is a multi-function configurable pin. By default, the pin functions as a global driver disable. If this function is not required, the pin be changed to an open-drain fault interrupt for the MCU through the device DRVOFF_nFLT register setting. When configured as DRVOFF, a logic high input will disable the drivers and logic low will allow for normal operation.

7.3.8.2 Low I_Q Powered Off Braking (POB, BRAKE)

The DRV871x-Q1 provide the ability to enable the low-side gate drivers while the device is in its low-power sleep mode (nSLEEP = logic low). This allows the external low-side power MOSFETs to be enabled while maintaining a low quiescent current draw from the power supply. Enabling the external low-side MOSFETs allows the device to actively brake a motor connected to the external half-bridges by shorting the back emf across the motor terminals. This can help prevent reverse driving of the motor by an external force from overcharging the system power supply by dissipating the energy in the low-side MOSFETs. This function is only available while the device is in its low-power sleep mode. The function is enabled by taking the BRAKE pin to logic high.

The powered off braking function is available on half-bridges 5, 6, 7, and 8 on the DRV8718-Q1 device. On the DRV8714-Q1, the power off braking function is available on all four half-bridges. The BRAKE pin will enable or disable the low-side gate drivers for all four of the half-bridges together. The powered off braking function requires the PVDD voltage supply to be present in order to enable the low-side gate drivers, but the function can operate without the DVDD logic power supply present.

In case of a short circuit to power supply fault present on the power stage, a simple overcurrent detector circuit with analog RC deglitch filter is provided to disable the low-side MOSFET if a high current event is detected while braking. This is needed since the normal overcurrent protection circuits are disabled during the device low-power sleep mode. The overcurrent comparator and RC deglitch filter values are fixed and cannot be adjusted.

The powered off braking function is enabled through the BRAKE pin and the BRAKE pin can be pulled high through several different methods. To reduce quiescent current draw, the pulldown resistance of the BRAKE pin is reduced to 1MOhm while in device low-power sleep mode. The BRAKE pin can be always left high while the device is in low-power sleep mode or can be set high in response to a rising voltage on the power supply. The BRAKE pin has an internal voltage clamp allowing it to be connected directly to the PVDD battery supply through a Zener diode (to set overvoltage threshold) with a series resistor to limit the current. The powered off function can be set to automatically enable in low-power sleep mode by leaving the BRAKE pin disconnected and relying on the internal overvoltage monitor.

Some methods to pull up the BRAKE pin and enable the powered off braking function include:

- Option 1: Internal overvoltage monitor. BRAKE pin should be left not-connected (Hi-Z)
- Option 2: Voltage triggered pull up with passive Zener diode. An external Zener diode can be added to the BRAKE pin to create an overvoltage trigger that is lower than the internal overvoltage monitor.
- Option 3: MCU fixed digital output high or MCU digital output in response to motor movement detected by senor or rising voltage. A digital output to the BRAKE pin can directly control whether the power off braking function is enabled (LO = disabled, HI = enabled).
- Option 4: The power off braking function can be disabled by shorting/connecting the BRAKE pin directly to PCB ground.

By default (BRAKE pin not connected), the powered off braking function is enabled by an internal overvoltage monitor that will detect the PVDD voltage and enable the low-side braking if voltage crosses the comparator threshold. The internal overvoltage monitor and power off braking function can be disabled by shorting the BRAKE pin directly to PCB ground.

Copyright © 2024 Texas Instruments Incorporated

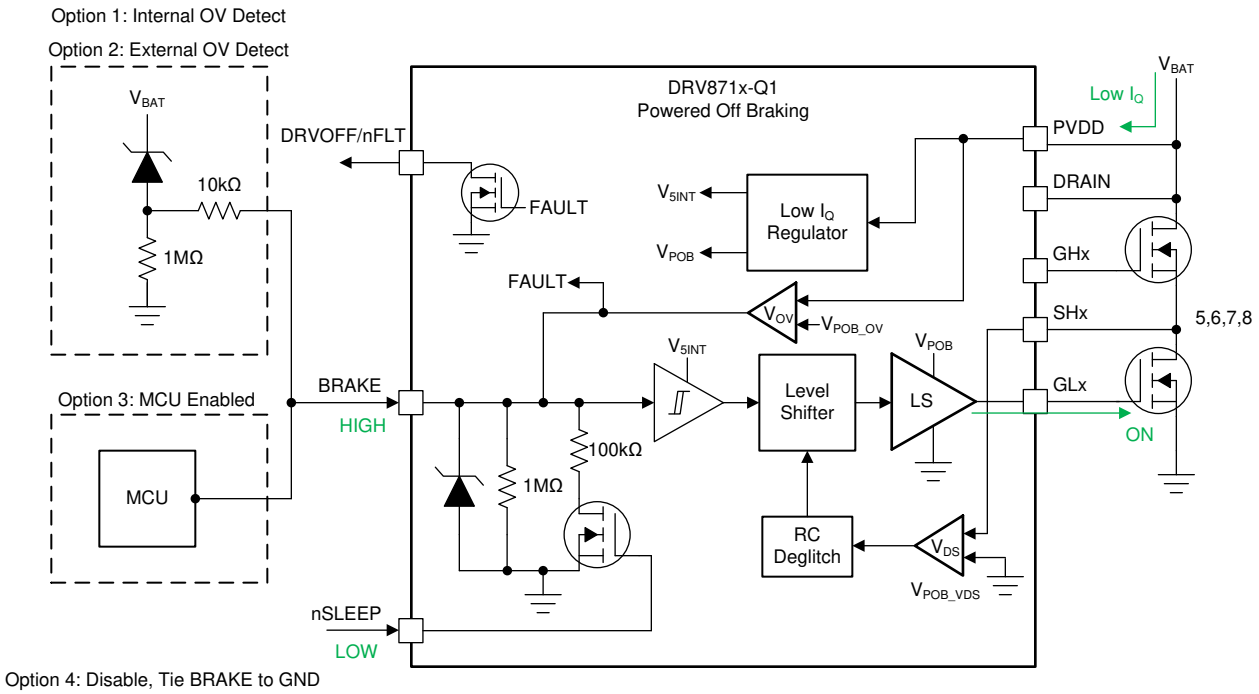

図 7-28. Powered Off Braking

注

If the powered off braking function is not utilized, the BRAKE pin should be connected directly to GND.

7.3.8.3 Fault Reset (CLR_FLT)

The DRV871x-Q1 provides a specific sequence to clear fault conditions from the driver and resume operation. This function is provided through the CLR_FLT register bit. To clear fault reporting the CLR_FLT register bit must be asserted after the fault condition is removed. After being asserted, the driver will clear the fault and reset the CLR_FLT register bit. The function is only available on SPI device variants. On H/W device variants, all faults will automatically recover once the condition is removed.

7.3.8.4 DVDD Logic Supply Power on Reset (DVDD_POR)

If at any time the input logic supply voltage on the DVDD pin falls below the V_{DVDD_POR} threshold for longer than the $t_{DVDD\_POR\_DG}$ time or the nSLEEP pin is asserted low, the device enter its inactive state disabling the gate drivers, charge pump, and protection monitors. Normal operation resumes when the DVDD undervoltage condition is removed or the nSLEEP pin is asserted high. After a DVDD power on reset (POR), the POR register bit is asserted until CLR_FLT is issued.

7.3.8.5 PVDD Supply Undervoltage Monitor (PVDD_UV)

If at any time the power supply voltage on the PVDD pin falls below the V_{PVDD_UV} threshold for longer than the $t_{PVDD\_UV\_DG}$ time, the DRV871x-Q1 detects a PVDD undervoltage condition. After detecting the undervoltage condition, the gate driver pull downs are enabled, charge pump disabled and nFAULT pin, FAULT register bit, and PVDD_UV register bit asserted.

On SPI device variants, the PVDD undervoltage monitor can recover in two different modes set through the PVDD_UV_MODE register setting.

- **Latched Fault Mode:** After the undervoltage condition is removed, the fault state remains latched and charge pump disabled until CLR_FLT is issued.

Copyright © 2024 Texas Instruments Incorporated

- **Automatic Recovery Mode:** After the undervoltage condition is removed, the nFAULT pin and FAULT register bit are automatically cleared and the charge pump automatically reenabled. The PVDD_UV register bit remains latched until CLR_FLT is issued.

On H/W device variants, the PVDD undervoltage monitor is fixed to automatic recovery mode.

7.3.8.6 PVDD Supply Overvoltage Monitor (PVDD_OV)

If the power supply voltage on the PVDD pin exceeds the V_{PVDD_OV} threshold for longer than the $t_{PVDD\_OV\_DG}$ time, the DRV871x-Q1 detects a PVDD overvoltage condition and action is taken according to the PVDD_OV_MODE register setting. The overvoltage threshold and deglitch time can be adjusted through the PVDD_OV_LVL and PVDD_OV_DG register settings.

On SPI device variants, the PVDD overvoltage monitor can respond and recover in four different modes set through the PVDD_OV_MODE register setting.

- **Latched Fault Mode:** After detecting the overvoltage condition, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and PVDD_OV register bit asserted. After the overvoltage condition is removed, the fault state remains latched until CLR_FLT is issued.
- **Automatic Recovery Mode:** After detecting the overvoltage condition, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and PVDD_OV register bit asserted. After the overvoltage condition is removed, the nFAULT pin and FAULT register bit are automatically cleared and the driver automatically reenabled. The PVDD_OV register bit remains latched until CLR_FLT is issued.
- **Warning Report Only Mode:** The PVDD overvoltage condition is reported in the WARN and PVDD_OV register bits. The device will not take any action. The warning remains latched until CLR_FLT is issued.
- **Disabled Mode:** The PVDD overvoltage monitor is disabled and will not respond or report.

On H/W device variants, the PVDD overvoltage monitor is disabled.

7.3.8.7 VCP Charge Pump Undervoltage Lockout (VCP_UV)

If at any time the voltage on the VCP pin falls below the V_{VCP_UV} threshold for longer than the $t_{VCP\_UV\_DG}$ time, the DRV871x-Q1 detects a VCP undervoltage condition. After detecting the undervoltage condition, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and VCP_UV register bit asserted. The undervoltage threshold can be adjusted through the VCP_UV_LVL register setting.

On SPI device variants, the VCP undervoltage monitor can recover in two different modes set through the VCP_UV_MODE register setting.

- **Latched Fault Mode:** Additionally the charge pump is disabled in latched fault mode. After the undervoltage condition is removed, the fault state remains latched and charge pump disabled until CLR_FLT is issued.
- **Automatic Recovery Mode:** After the undervoltage condition is removed, the nFAULT pin and FAULT register bit are automatically cleared and the driver automatically reenabled. The VCP_UV register bit remains latched until CLR_FLT is issued.

On H/W device variants, the VCP undervoltage monitor is fixed to automatic recovery mode and the threshold to 2-V.

7.3.8.8 MOSFET V_{DS} Overcurrent Protection (VDS_OCP)

If the voltage across the V_{DS} overcurrent comparator exceeds the V_{DS_LVL} for longer than the t_{DS_DG} time, the DRV871x-Q1 detects a V_{DS} overcurrent condition. The voltage threshold and deglitch time can be adjusted through the VDS_LVL and VDS_DG register settings. Additionally, in independent half-bridge and DRV8714-Q1 split HS/LS PWM control (BRG_MODE = 00b, 11b) the device can be configured to disable all half-bridges or only the associated half-bridge in which the fault occurred through the VDS_IND register setting. In the DRV8714-Q1 PH/EN and PWM H-bridge control modes (BRG_MODE = 01b, 10b), the VDS_IND register setting can be used to disable all H-bridges or only the associated H-bridge in which the fault occurred.

On SPI device variants, the V_{DS} overcurrent monitor can respond and recover in four different modes set through the VDS_MODE register setting.

Copyright © 2024 Texas Instruments Incorporated

- **Latched Fault Mode:** After detecting the overcurrent event, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and associated VDS register bit asserted. After the overcurrent event is removed, the fault state remains latched until CLR_FLT is issued.
- **Cycle by Cycle Mode:** After detecting the overcurrent event, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and associated VDS register bit asserted. The next PWM input will clear the nFAULT pin and FAULT register bit and reenable the driver automatically. The associated VDS register bit will remain asserted until CLR_FLT is issued.
- **Warning Report Only Mode:** The overcurrent event is reported in the WARN and associated VDS register bits. The device will not take any action. The warning remains latched until CLR_FLT is issued.
- **Disabled Mode:** The V_{DS} overcurrent monitors are disabled and will not respond or report.

On H/W device variants, the V_{DS} overcurrent mode is fixed to cycle by cycle and t_{VDS_DG} is fixed to 4 µs. Independent half-bridge shutdown is automatically enabled for the independent half-bridge and split HS/LS PWM control modes. Independent H-bridge shutdown is automatically enabled for the H-bridge PWM control modes. Additionally, the V_{DS} overcurrent protection can be disabled through level 6 of the VDS pin multi-level input.

When a V_{DS} overcurrent fault occurs, the gate pull down current can be configured in order to increase or decrease the time to disable the external MOSFET. This can help to avoid a slow-turn off during high-current short circuit conditions. This setting is configure through the VDS_IDRVN register setting on SPI devices. On hardware devices, this setting is automatically matched to the programmed I_{DRVN} current.

7.3.8.9 Gate Driver Fault (VGS_GDF)

If the V_{GS} voltage does not cross the the V_{GS_LVL} comparator level for longer than the t_{DRIVE} time, the DRV871x-Q1 detects a V_{GS} gate fault condition. Additionally, in independent half-bridge and DRV8714-Q1 split HS/LS PWM control (BRG_MODE = 00b, 11b) the device can be configured to disable all half-bridges or only the associated half-bridge in which the gate fault occurred through the VGS_IND register setting. In the DRV8714-Q1 PH/EN and PWM H-bridge control modes (BRG_MODE = 01b, 10b), the VGS_IND register setting can be used to disable all H-bridges or only the associated H-bridge in which the fault occurred.

On SPI device variants, the V_{GS} gate fault monitor can respond and recover in four different modes set through the VGS_MODE register setting.

- **Latched Fault Mode:** After detecting the gate fault event, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and associated VGS register bit asserted. After the gate fault event is removed, the fault state remains latched until CLR_FLT is issued.
- **Cycle by Cycle Mode:** After detecting the gate fault event, the gate driver pull downs are enabled and nFAULT pin, FAULT register bit, and associated VGS register bit asserted. The next PWM input will clear the nFAULT pin and FAULT register bit and reenable the driver automatically. The associated VGS register bit will remain asserted until CLR_FLT is issued.
- **Warning Report Only Mode:** The overcurrent event is reported in the WARN and associated VGS register bits. The device will not take any action. The warning remains latched until CLR_FLT is issued.
- **Disabled Mode:** The V_{GS} gate fault monitors are disabled and will not respond or report.

On H/W device variants, the V_{GS} gate fault mode is fixed to cycle by cycle and t_{DRIVE} is fixed to 4 µs. Independent half-bridge shutdown is automatically enabled for the independent half-bridge and split HS/LS PWM control modes. Independent H-bridge shutdown is automatically enabled for the H-bridge PWM control modes. Additionally, the V_{GS} gate fault protection can be disabled through level 6 of the VDS pin multi-level input.

7.3.8.10 Thermal Warning (OTW)

If the die temperature exceeds the T_{OTW} thermal warning threshold the DRV871x-Q1 detects an overtemperature warning and asserts the WARN and OTW register bits. After the overtemperature condition is removed the WARN and OTW register bits remain asserted until CLR_FLT is issued.

On H/W device variants, the overtemperature warning is not detected or reported.

Copyright © 2024 Texas Instruments Incorporated

7.3.8.11 Thermal Shutdown (OTSD)

If the die temperature exceeds the T_{OTSD} thermal shutdown threshold the DRV871x-Q1 detects an overtemperature fault. After detecting the overtemperature fault, the gate driver pull downs are enabled, the charge pump disabled and nFAULT pin, FAULT register bit, and OTSD register bit asserted. After the overtemperature condition is removed the fault state remains latched until CLR_FLT is issued.

On H/W device variants, after the overtemperature condition is removed, the nFAULT pin is automatically cleared and the driver and charge pump automatically reenabled.

7.3.8.12 Offline Short Circuit and Open Load Detection (OOL and OSC)

The device provides the necessary hardware to conduct offline short circuit and open load diagnostics of the external power MOSFETs and load. This is accomplished by an integrated pull up and pull down current source on the SHx pin which connect to the external half-bridge switch-node. The offline diagnostics are controlled by the associated registers bits in the OLSC_CTRL register. First, the offline diagnostic mode needs to be enabled through the EN_OLSC register setting. Then the individual current sources can be enabled through the PD_SHx and PU_SHx register settings.

The voltage on the SHx pin will be continuously monitored through the internal V_{DS} comparators. During the diagnostic state the V_{DS} comparators will report the real-time voltage feedback on the SHx pin node in the SPI registers in the associated VDS register status bit. When in the V_{DS} comparators are in diagnostic mode, the global DS_GS SPI register bits will not report faults or warnings.

Before enabling the offline diagnostics it is recommended to place the external MOSFET half-bridges in the disabled state through the EN_DRV register setting. Additionally, the V_{DS} comparator threshold (VDS_LVL) should be adjusted to 1-V or greater to ensure enough headroom for the internal blocking diode forward voltage drop.

On H/W device variants, this feature is not available.

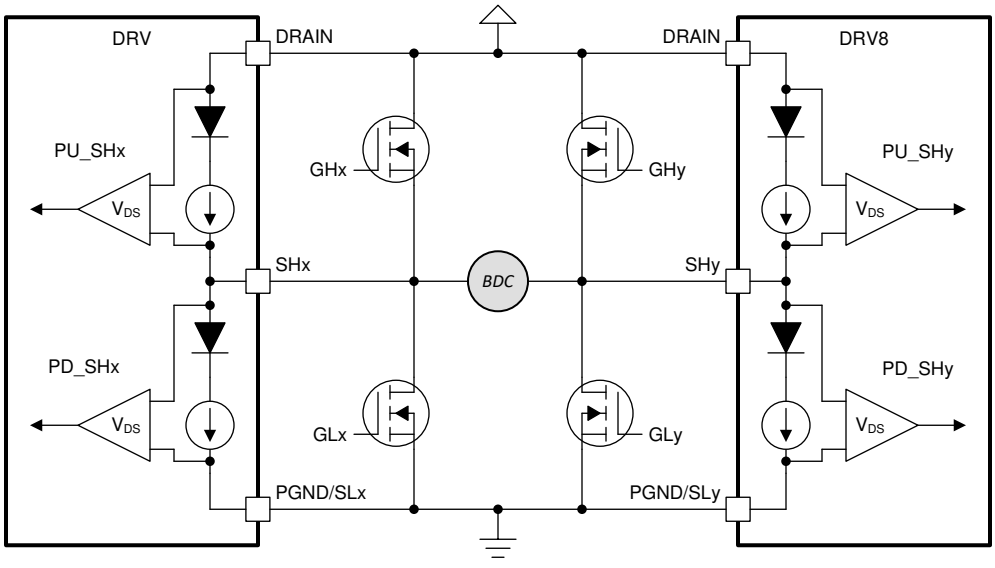

図 7-29. Offline Diagnostics

Copyright © 2024 Texas Instruments Incorporated

注

The V_{DS} comparators will start real-time voltage feedback immediately after OLSC_EN is set. Feedback should be ignored until the proper pull up and pull down configuration is set.

7.3.8.13 Watchdog Timer

The device integrates a programmable window type SPI watchdog timer to verify that the external controller is operating and the SPI bus integrity is monitored. The SPI watchdog timer can be enabled by through the WD_EN SPI register bit. The watchdog timer is disabled by default. When the watchdog timer is enabled, an internal timer starts to count up. The watcher dog timer is reset by inverting the WD_RST SPI register.. This WD_RST must be issued between the lower window time and the upper window time. If a watchdog timer fault is detected, the device response can be configured to either report only a warning or report a fault and disabled the half-bridge drivers. If the watchdog is set to disable the half-bridges drivers, the drivers will be reenabled after a CLR_FLT command is sent to remove the watchdog fault condition.

7.4 Device Functional Modes

7.4.1 Inactive or Sleep State

When the nSLEEP pin is logic low or the DVDD power supply is below the V_{DVDD_POR} threshold, the device enters a low power sleep state to reduce device quiescent current draw by the device. In this state, all major

Copyright © 2024 Texas Instruments Incorporated

functional blocks are disabled aside from a low power monitor on the nSLEEP pin and the powered off braking function if enabled. Passive gate pull downs are provided for the external MOSFET gates to maintain the MOSFETs in an off state. After exiting the inactive sleep state, all device registers will be reset to defaults.

7.4.2 Standby State

When the nSLEEP pin is logic high and DVDD input has crossed the V_{DVDD_POR} threshold, the device enters a power on standby state after t_{WAKE} delay. The digital core and SPI communication will be active but the charge pump and gate drivers will remain disabled until the PVDD input has crossed the V_{PVDD_UV} threshold. In this state, the SPI registers can be programmed and faults reported, but no gate driver operation is possible.

7.4.3 Operating State

When the nSLEEP pin is logic high, the DVDD input has crossed the V_{DVDD_POR} threshold, and the PVDD input has crossed the V_{PVDD_UV} threshold, the devices enters its full operating state. In this state, all major functional blocks are active aside from the gate drivers. The gate drivers must be enabled through the EN_DRV register bit before full operation can begin.

On H/W device variants, the device will automatically enable the drivers in the operating state.

7.5 Programming

7.5.1 SPI Interface

An SPI bus is used to set device configurations, operating parameters, and read out diagnostic information on the DRV871x-Q1 devices. The SPI operates in slave mode and connects to a master controller. The SPI input data (SDI) word consists of a 16 bit word, with an 8 bit command and 8 bits of data. The SPI output data (SDO) word consists of the fault status indication bits and then the register data being accessed for read commands or null for write commands. The data sequence between the MCU and the SPI slave driver is shown in 図 7-30.

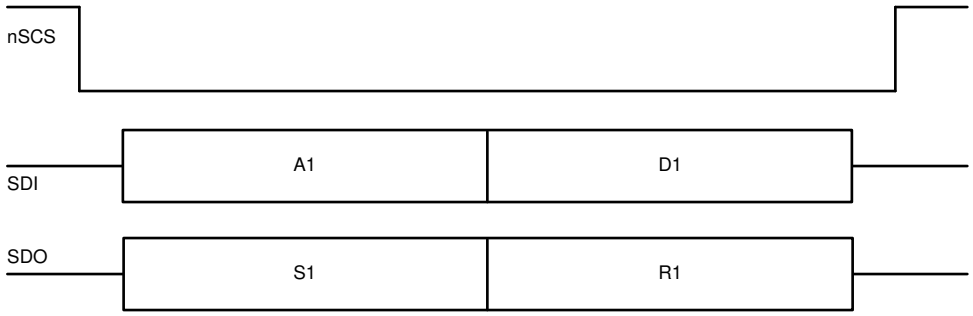

図 7-30. SPI Data Frame

A valid frame must meet the following conditions:

- The SCLK pin should be low when the nSCS pin transitions from high to low and from low to high.
- The nSCS pin should be pulled high between words.
- When the nSCS pin is pulled high, any signals at the SCLK and SDI pins are ignored and the SDO pin is placed in the Hi-Z state.
- Data is captured on the falling edge of SCLK and data is propagated on the rising edge of SCLK.
- The most significant bit (MSB) is shifted in and out first.
- A full 16 SCLK cycles must occur for transaction to be valid.
- If the data word sent to the SDI pin is less than or more than 16 bits, a frame error (SCLK_FLT) occurs and the data word is ignored.
- For a write command, the existing data in the register being written to is shifted out on the SDO pin follow the 8 bit command data.

Copyright © 2024 Texas Instruments Incorporated

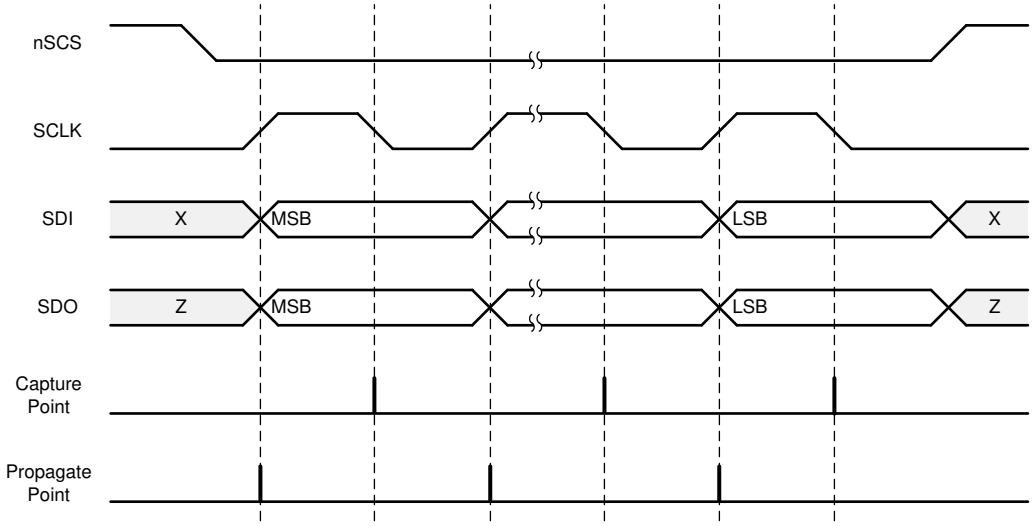

図 7-31. SPI Slave Timing Diagram

7.5.2 SPI Format

The SDI input data word is 16 bits long and consists of the following format:

- 1 read or write bit, W (bit B14)
- 6 address bits, A (bits B13 through B8)
- 8 data bits, D (bits B7 through B0)

The SDO output data word is 16 bits long and the first 8 bits makes up the IC status register. The report word is the content of the register being accessed.

For a write command (W0 = 0), the response word consists of the fault status indication bits followed by the existing data in the register being written to.

For a read command (W0 = 1), the response word consists of the fault status indications bits followed by the data currently in the register being read.

表 7-18. SDI Input Data Word Format

		R/W	Address						Data							
Bit	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Data	0	W0	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0

表 7-19. SDO Output Data Word Format

	IC Status								Report							
Bit	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Data	1	1	FAULT	WARN	DS_GS	UV	OV	OT_WD_AGD	D7	D6	D5	D4	D3	D2	D1	D0

7.5.3 SPI Interface for Multiple Slaves

Multiple DRV871x-Q1 devices can be connected to the master controller with and without the daisy chain. For connecting a 'n' number of DRV871x-Q1 to a master controller without using a daisy chain, 'n' number of I/O resources from master controller has to utilized for nSCS pins as shown 図 7-32. Whereas, if the daisy chain configuration is used, then a single nSCS line can be used for connecting multiple DRV871x-Q1 devices. 図 7-33

Copyright © 2024 Texas Instruments Incorporated

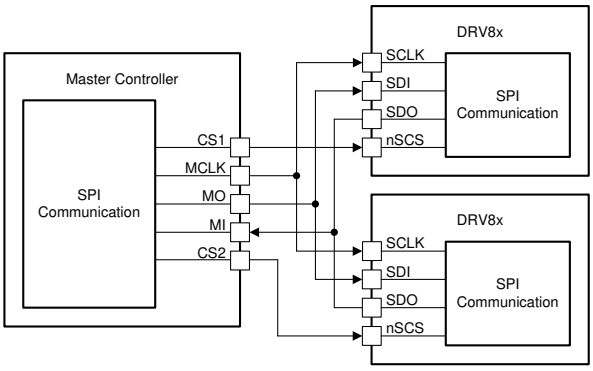

図 7-32. SPI Operation Without Daisy Chain

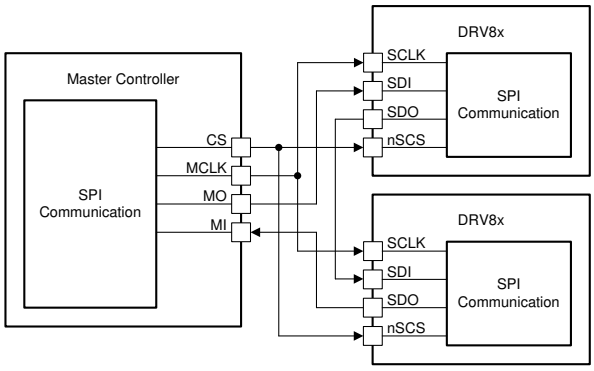

図 7-33. SPI Operation With Daisy Chain

7.5.3.1 SPI Interface for Multiple Slaves in Daisy Chain

The DRV871x-Q1 device can be connected in a daisy chain configuration to save GPIO ports when multiple devices are communicating to the same MCU. 図 7-34 shows the topology when 3 devices are connected in series with waveforms.

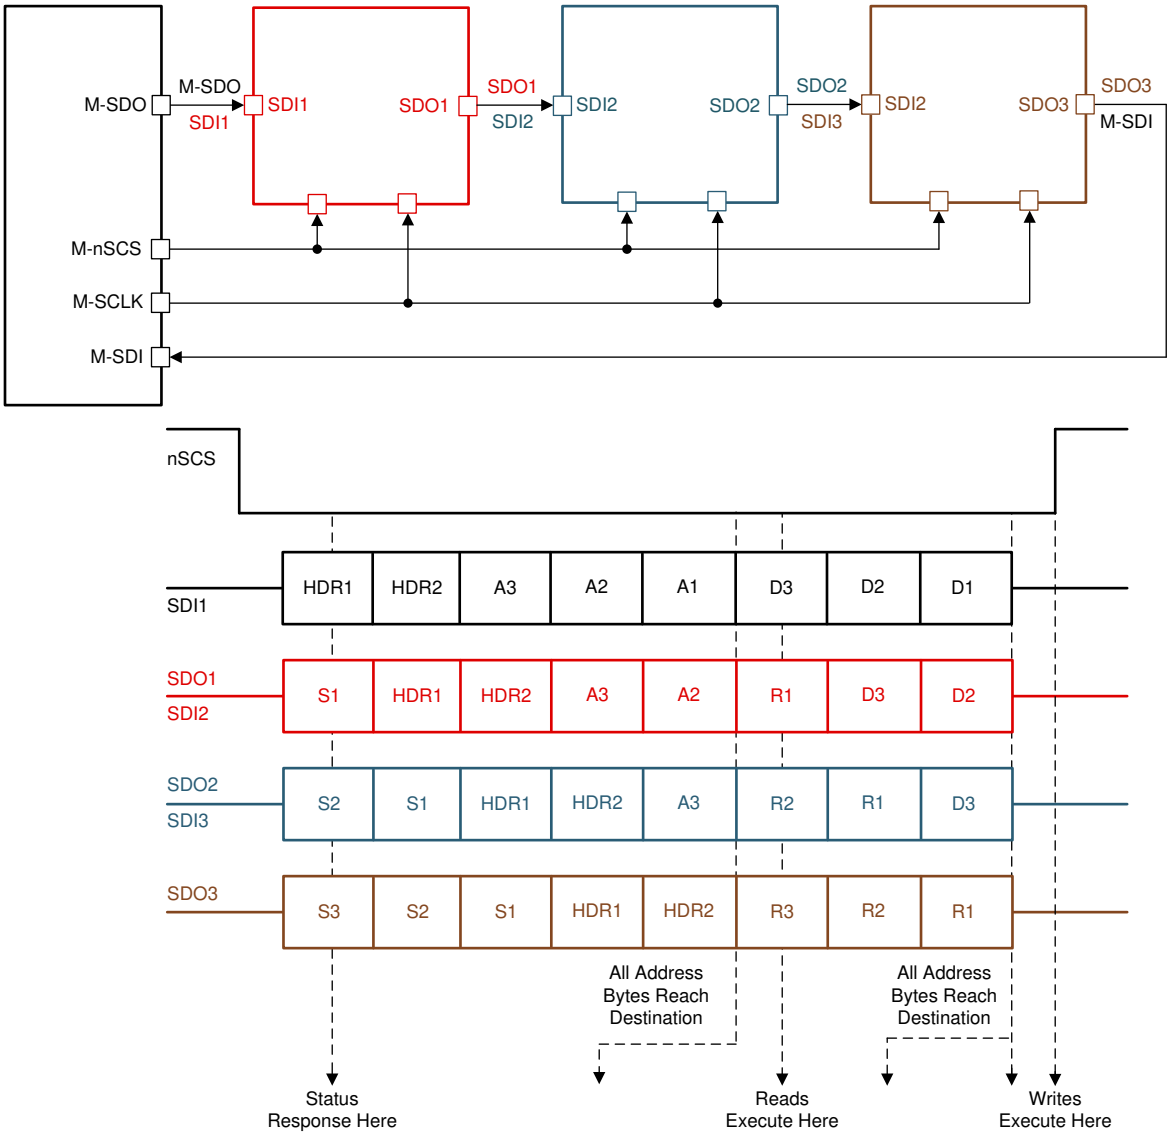

図 7-34. Daisy Chain SPI Operation

The first device in the chain shown above receives data from the master controller in the following format. See SDI1 in 図 7-34

- 2 bytes of Header
- 3 bytes of Address
- 3 bytes of Data

After the data has been transmitted through the chain, the master controller receives it in the following format. See SDO3 in 図 7-34

- 3 bytes of Status

Copyright © 2024 Texas Instruments Incorporated

- 2 bytes of Header (should be identical to the information controller sent)
- 3 bytes of Report

The Header bytes contain information of the number of devices connected in the chain, and a global clear fault command that will clear the fault registers of all the devices on the rising edge of the chip select (nSCS) signal. N5 through N0 are 6 bits dedicated to show the number of device in the chain as shown in 図 7-35. Up to 63 devices can be connected in series per daisy chain connection.

The 5 LSBs of the HDR2 register are don't care bits that can be used by the MCU to determine integrity of the daisy chain connection. Header bytes must start with 1 and 0 for the two MSBs.

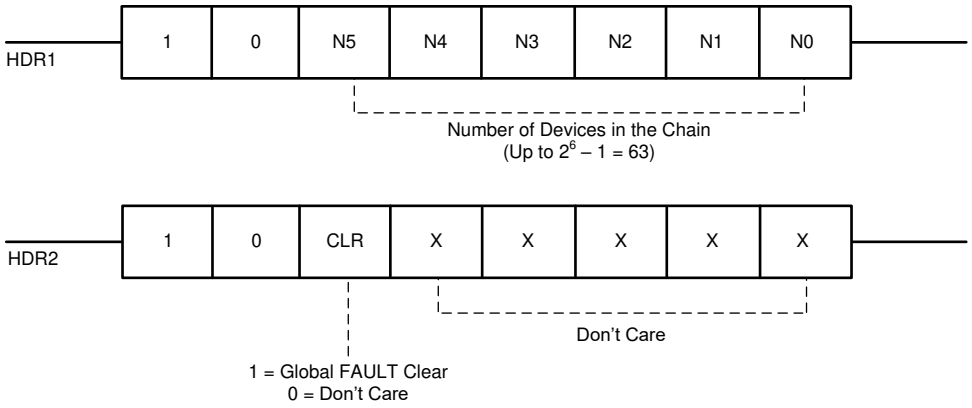

図 7-35. Header Bits

The Status byte provides information about the fault status register for each device in the daisy chain as shown in 図 7-36. That way the master controller does not have to initiate a read command to read the fault status from any particular device. This saves the controller additional read commands and makes the system more efficient to determine fault conditions flagged in a device.

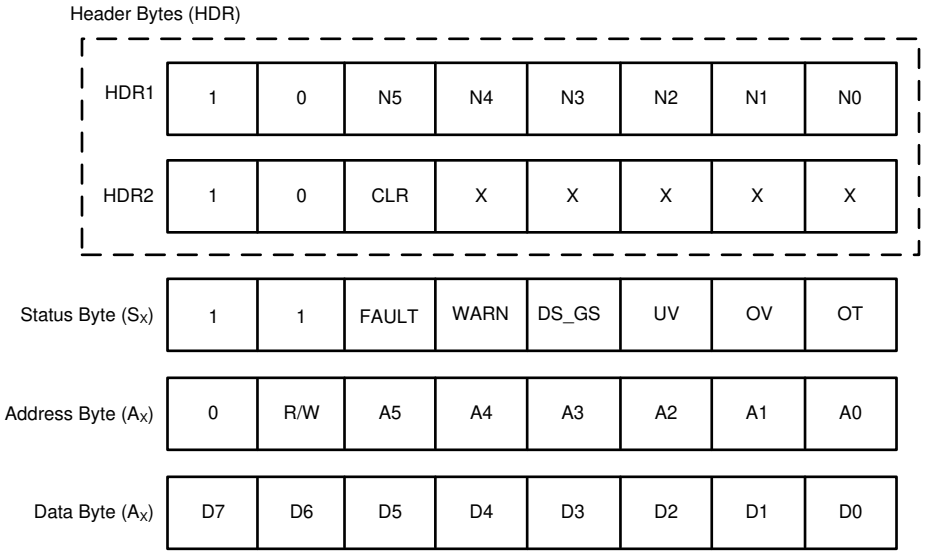

図 7-36. Daisy Chain Read Registers

Copyright © 2024 Texas Instruments Incorporated

When data passes through a device, it determines the position of itself in the chain by counting the number of Status bytes it receives following by the first Header byte. For example, in this 3 device configuration, device 2 in the chain will receive two Status bytes before receiving HDR1 byte, followed by HDR2 byte.

From the two Status bytes it knows that its position is second in the chain, and from HDR2 byte it knows how many devices are connected in the chain. That way it only loads the relevant address and data byte in its buffer and bypasses the other bits. This protocol allows for faster communication without adding latency to the system for up to 63 devices in the chain.

The address and data bytes remain the same with respect to a single device connection. The Report bytes (R1 through R3), as shown in the figure above, is the content of the register being accessed.

8 Register Maps

The DRV8718-Q1 and DRV8714-Q1 registers provide variety of feedback information and configuration options. These include specific fault diagnostics, general device configurations, driver configurations, fault and diagnostic configurations, and amplifier configurations. Additionally, the advanced register maps provide advanced driver functions to assist in certain system conditions, but not required for standard operation of the device.

To assist with software development and reuse, the DRV8718-Q1 and DRV8714-Q1 register maps share an overlapping register structure with differences for specific device properties. The primary differences between the two device register maps are outlined below.

Register Map Differences:

- DRV8714-Q1: VDS_STAT2 (02h) and VGS_STAT2 (04h) are reserved.
- DRV8714-Q1: BRG_CTRL2 (0Ah) and PWM_CTRL2 (0Ch) are repurposed for H-bridge control functions.
- DRV8714-Q1: PWM_CTRL3 [3:0] (0Dh) PWM_CTRL4 [3:0] (0Eh) are reserved.
- DRV8714-Q1: IDRV_CTRL5, 6, 7, and 8 (13h, 14h, 15h, and 16h) are reserved.
- DRV8714-Q1: IDRV_CTRL9 [3:0] (17h) are reserved.
- DRV8714-Q1: DRV_CTRL2, 3, 4, 5, and 6 (19h, 1Ah, 1Bh, 1Ch, and 1Dh) are now half-bridge specific instead of H-bridge specific (DRV8718-Q1).
- DRV8714-Q1: VDS_CTRL3 (21h) and VDS_CTRL4 (22h) are reserved.
- DRV8714-Q1: OLSC_CTRL2 (24h) is reserved.

Advanced Register Map Differences:

- DRV8714-Q1: All register are now half-bridge specific instead of H-bridge specific (DRV8718-Q1).

注

The DRV8718-Q1 56-Pin VQFN (RVJ) and DRV8714-Q1 56-Pin VQFN (RVJ) packages are drop in pin-to-pin compatible. Please note that the locations of half-bridges 1,2,3 and 4 will be shifted for the DRV8714-Q1 to help with PCB routing.

8.3 DRV8718-Q1 Register Descriptions

8.3.1 DRV8718-Q1_STATUS Registers

表 8-5 lists the DRV8718-Q1_STATUS registers. All register offset addresses not listed in 表 8-5 should be considered as reserved locations and the register contents should not be modified.

表 8-5. DRV8718-Q1_STATUS Registers

Address	Acronym	Register Name	Section
0h	IC_STAT1	Global fault and warning status indicators	Go
1h	VDS_STAT1	Half-bridge 1-4 VDS overcurrent fault status indicators	Go
2h	VDS_STAT2	Half-bridge 5-8 VDS overcurrent fault status indicators	Go
3h	VGS_STAT1	Half-bridge 1-4 VGS gate fault status indicators	Go
4h	VGS_STAT2	Half-bridge 5-8 VGS gate fault status indicators	Go
5h	IC_STAT2	Voltage, temperature and interface fault status indicators	Go
6h	IC_STAT3	Device variant ID status register	Go

Complex bit access types are encoded to fit into small table cells. 表 8-6 shows the codes that are used for access types in this section.

表 8-6. DRV8718-Q1_STATUS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
- *n*		Value after reset or the default value

8.3.1.1 IC_STAT1 Register (Address = 0h) [Reset = C0h]

IC_STAT1 is shown in 図 8-1 and described in 表 8-7.

Return to the Summary Table.

Status register for global fault and warning indicators. Detailed fault information is available in remaining status registers.

図 8-1. IC_STAT1 Register

7	6	5	4	3	2	1	0
SPI_OK	POR	FAULT	WARN	DS_GS	UV	OV	OT_WD_AGD
R-1b	R-1b	R-0b	R-0b	R-0b	R-0b	R-0b	R-0b

表 8-7. IC_STAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	SPI_OK	R	1b	Indicates if a SPI communications fault has been detected. 0b = One or multiple of SCLK_FLT in the prior frames. 1b = No SPI fault has been detected
6	POR	R	1b	Indicates power-on-reset condition. 0b = No power-on-reset condition detected. 1b = Power-on reset condition detected.
5	FAULT	R	0b	Fault indicator. Mirrors nFAULT pin.
4	WARN	R	0b	Warning indicator.
3	DS_GS	R	0b	Logic OR of VDS and VGS fault indicators.
2	UV	R	0b	Undervoltage indicator.

Copyright © 2024 Texas Instruments Incorporated

表 8-7. IC_STAT1 Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
1	OV	R	0b	Overvoltage indicator.
0	OT_WD_AGD	R	0b	Logic OR of OTW, OTSD, WD_FLT, IDIR_WARN, PCHR_WARN, PDCHR_WARN, and STC_WARN indicators.

8.3.1.2 VDS_STAT1 Register (Address = 1h) [Reset = 0h]

VDS_STAT1 is shown in 図 8-2 and described in 表 8-8.

Return to the Summary Table.

Status register for the specific MOSFET VDS overcurrent fault indication for half-bridges 1-4.

図 8-2. VDS_STAT1 Register

7	6	5	4	3	2	1	0
VDS_H1	VDS_L1	VDS_H2	VDS_L2	VDS_H3	VDS_L3	VDS_H4	VDS_L4
R-0b	R-0b	R-0b	R-0b	R-0b	R-0b	R-0b	R-0b

表 8-8. VDS_STAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	VDS_H1	R	0b	Indicates VDS overcurrent fault on the high-side 1 MOSFET.
6	VDS_L1	R	0b	Indicates VDS overcurrent fault on the low-side 1 MOSFET.
5	VDS_H2	R	0b	Indicates VDS overcurrent fault on the high-side 2 MOSFET.
4	VDS_L2	R	0b	Indicates VDS overcurrent fault on the low-side 2 MOSFET.
3	VDS_H3	R	0b	Indicates VDS overcurrent fault on the high-side 3 MOSFET.
2	VDS_L3	R	0b	Indicates VDS overcurrent fault on the low-side 3 MOSFET.
1	VDS_H4	R	0b	Indicates VDS overcurrent fault on the high-side 4 MOSFET.
0	VDS_L4	R	0b	Indicates VDS overcurrent fault on the low-side 4 MOSFET.

8.3.1.3 VDS_STAT2 Register (Address = 2h) [Reset = 0h]

VDS_STAT2 is shown in 図 8-3 and described in 表 8-9.

Return to the Summary Table.

Status register for the specific MOSFET VDS overcurrent fault indication for half-bridges 5-8.

図 8-3. VDS_STAT2 Register

7	6	5	4	3	2	1	0
VDS_H5	VDS_L5	VDS_H6	VDS_L6	VDS_H7	VDS_L7	VDS_H8	VDS_L8

8.3.2.1 IC_CTRL1 Register (Address = 7h) [Reset = 6h]

IC_CTRL1 is shown in 図 8-8 and described in 表 8-16.

Return to the Summary Table.

Control register for driver and diagnostic enable, SPI lock, and clear fault command.

図 8-8. IC_CTRL1 Register

7	6	5	4	3	2	1	0
EN_DRV	EN_OLSC	RESERVED		LOCK			CLR_FLT
R/W-0b	R/W-0b	R-00b		R/W-011b			R/W-0b

表 8-16. IC_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	EN_DRV	R/W	0b	Enable gate drivers. 0b = Gate driver output disabled and passive pulldowns enabled. 1b = Gate driver outputs enabled.
6	EN_OLSC	R/W	0b	Enable offline open load and short circuit diagnostic. 0b = Disabled. 1b = VDS monitors set into real-time voltage monitor mode and offline diagnostics current sources enabled.
5-4	RESERVED	R	00b	Reserved
3-1	LOCK	R/W	011b	Lock and unlock the control registers. Bit settings not listed have no effect. 011b = Unlock all control registers. 110b = Lock the control registers by ignoring further writes except to the LOCK register.
0	CLR_FLT	R/W	0b	Clear latched fault status information. 0b = Default state. 1b = Clear latched fault bits, resets to 0b after completion. Will also clear SPI fault and watchdog fault status.

8.3.2.2 IC_CTRL2 Register (Address = 8h) [Reset = 2h]

IC_CTRL2 is shown in 図 8-9 and described in 表 8-17.

Return to the Summary Table.

Control register for pin mode, charge pump mode, and watchdog.

図 8-9. IC_CTRL2 Register

7	6	5	4	3	2	1	0
DIS_SSC	DRVOFF_nFLT	CP_MODE		WD_EN	WD_FLT_M	WD_WIN	WD_RST

表 8-17. IC_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	DIS_SSC	R/W	0b	Spread spectrum clocking 0b = Enabled. 1b = Disabled.
6	DRVOFF_nFLT	R/W	0b	Sets DRVOFF/nFLT multi-function pin mode. 0b = Pin functions as DRVOFF global driver disable. 1b = Pin functions as nFLT open-drain fault interrupt output.
5-4	CP_MODE	R/W	00b	Charge pump operating mode. 00b = Automatic switch between tripler and doubler mode. 01b = Always doubler mode. 10b = Always tripler mode. 11b = RSVD
3	WD_EN	R/W	0b	Watchdog timer enable. 0b = Watchdog timer disabled. 1b = Watchdog dog timer enabled.
2	WD_FLT_M	R/W	0b	Watchdog fault mode. Watchdog fault is cleared by CLR_FLT. 0b = Watchdog fault is reported to WD_FLT and WARN register bits. Gate drivers remain enabled and nFAULT is not asserted. 1b = Watchdog fault is reported to WD_FLT, FAULT register bits, and nFAULT pin. Gate drivers are disabled in response to watchdog fault.
1	WD_WIN	R/W	1b	Watchdog timer window. 0b = 4 to 40 ms 1b = 10 to 100 ms
0	WD_RST	R/W	0b	Watchdog restart. 0b by default after power up. Invert this bit to restart the watchdog timer. After written, the bit will reflect the new inverted value.

8.3.2.3 BRG_CTRL1 Register (Address = 9h) [Reset = 0h]

BRG_CTRL1 is shown in 図 8-10 and described in 表 8-18.

Return to the Summary Table.

Control register to set the output state for half-bridges 1-4.

Complex bit access types are encoded to fit into small table cells. 表 8-82 shows the codes that are used for access types in this section.

表 8-82. DRV8714-Q1_CONTROL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
- *n*		Value after reset or the default value

8.4.2.1 IC_CTRL1 Register (Address = 7h) [Reset = 6h]

IC_CTRL1 is shown in 図 8-67 and described in 表 8-83.

Return to the Summary Table.

Control register for driver and diagnostic enable, PWM control mode, SPI lock, and clear fault command.

図 8-67. IC_CTRL1 Register

7	6	5	4	3	2	1	0
EN_DRV	EN_OLSC	BRG_MODE		LOCK			CLR_FLT
R/W-0b	R/W-0b	R/W-00b		R/W-011b			R/W-0b

表 8-83. IC_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	EN_DRV	R/W	0b	Enable gate drivers. 0b = Gate driver output disabled and passive pulldowns enabled. 1b = Gate driver outputs enabled.
6	EN_OLSC	R/W	0b	Enable offline open load and short circuit diagnostic. 0b = Disabled. 1b = VDS monitors set into real-time voltage monitor mode and offline diagnostics current sources enabled.
5-4	BRG_MODE	R/W	00b	Bridge PWM control mode. 00b = Independent Half-Bridge 01b = H-Bridge PH/EN 10b = H-Bridge PWM 11b = Solenoid Control
3-1	LOCK	R/W	011b	Lock and unlock the control registers. Bit settings not listed have no effect. 011b = Unlock all control registers. 110b = Lock the control registers by ignoring further writes except to the LOCK register.
0	CLR_FLT	R/W	0b	Clear latched fault status information. 0b = Default state. 1b = Clear latched fault bits, resets to 0b after completion. Will also clear SPI fault and watchdog fault status.

8.4.2.2 IC_CTRL2 Register (Address = 8h) [Reset = 2h]

IC_CTRL2 is shown in 図 8-68 and described in 表 8-84.

Return to the Summary Table.

Control register for pin mode, charge pump mode, and watchdog.

図 8-68. IC_CTRL2 Register

7	6	5	4	3	2	1	0
DIS_SSC	DRVOFF_nFLT	CP_MODE		WD_EN	WD_FLT_M	WD_WIN	WD_RST
R/W-0b	R/W-0b	R/W-00b		R/W-0b	R/W-0b	R/W-1b	R/W-0b

表 8-84. IC_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	DIS_SSC	R/W	0b	Spread spectrum clocking 0b = Enabled. 1b = Disabled.
6	DRVOFF_nFLT	R/W	0b	Sets DRVOFF/nFLT multi-function pin mode. 0b = Pin functions as DRVOFF global driver disable. 1b = Pin functions as nFLT open-drain fault interrupt output.

表 8-84. IC_CTRL2 Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
5-4	CP_MODE	R/W	00b	Charge pump operating mode. 00b = Automatic switch between tripler and doubler mode. 01b = Always doubler mode. 10b = Always tripler mode. 11b = RSVD
3	WD_EN	R/W	0b	Watchdog timer enable. 0b = Watchdog timer disabled. 1b = Watchdog dog timer enabled.
2	WD_FLT_M	R/W	0b	Watchdog fault mode. Watchdog fault is cleared by CLR_FLT. 0b = Watchdog fault is reported to WD_FLT and WARN register bits. Gate drivers remain enabled and nFAULT is not asserted. 1b = Watchdog fault is reported to WD_FLT, FAULT register bits, and nFAULT pin. Gate drivers are disabled in response to watchdog fault.
1	WD_WIN	R/W	1b	Watchdog timer window. 0b = 4 to 40 ms 1b = 10 to 100 ms
0	WD_RST	R/W	0b	Watchdog restart. 0b by default after power up. Invert this bit to restart the watchdog timer. After written, the bit will reflect the new inverted value.

8.4.2.3 BRG_CTRL1 Register (Address = 9h) [Reset = 0h]

BRG_CTRL1 is shown in 図 8-69 and described in 表 8-85.

Return to the Summary Table.

Control register to set the output state for half-bridges 1-4 in independent half-bridge mode (BRG_MODE = 00b).

図 8-69. BRG_CTRL1 Register

8.4.3 DRV8714-Q1_CONTROL_ADV Registers

表 8-109 lists the DRV8714-Q1_CONTROL_ADV registers. All register offset addresses not listed in 表 8-109 should be considered as reserved locations and the register contents should not be modified.

表 8-109. DRV8714-Q1_CONTROL_ADV Registers

Address	Acronym	Register Name	Section
2Ah	AGD_CTRL1	Adaptive gate drive general control functions	Go
2Bh	PDR_CTRL1	Half-bridge 1 and 2 PDR delay and max current settings	Go
2Ch	PDR_CTRL2	Half-bridge 3 and 4 PDR delay and max current settings	Go
2Dh	PDR_CTRL3	Half-bridge 5 and 6 PDR delay and max current settings	Go
2Eh	PDR_CTRL4	Half-bridge 7 and 8 PDR delay and max current settings	Go
2Fh	PDR_CTRL5	Half-bridge 1 PDR charge and discharge initial settings.	Go
30h	PDR_CTRL6	Half-bridge PDR charge and discharge initial settings.	Go
31h	PDR_CTRL7	Half-bridge 3 PDR charge and discharge initial settings.	Go
32h	PDR_CTRL8	Half-bridge 4 PDR charge and discharge initial settings.	Go
33h	PDR_CTRL9	Half-bridge 1 and 2 PDR loop controller gain	Go
34h	PDR_CTRL10	Half-bridge 3 and 4 PDR loop controller gain	Go
35h	STC_CTRL1	Half-bridge 1 STC rise/fall time and controller gain	Go
36h	STC_CTRL2	Half-bridge 2 STC rise/fall time and controller gain	Go
37h	STC_CTRL3	Half-bridge 3 STC rise/fall time and controller gain	Go
38h	STC_CTRL4	Half-bridge 4 STC rise/fall time and controller gain	Go
39h	DCC_CTRL1	Half-bridge 1-4 DCC enable and manual control	Go
3Ah	PST_CTRL1	Half-bridge 1-4 freewheel and post charge delay control	Go
3Bh	PST_CTRL2	Half-bridge 1-4 post charge controller gain	Go

Complex bit access types are encoded to fit into small table cells. 表 8-110 shows the codes that are used for access types in this section.

表 8-110. DRV8714-Q1_CONTROL_ADV Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
- *n*		Value after reset or the default value

8.4.3.1 AGD_CTRL1 Register (Address = 2Ah) [Reset = 40h]

AGD_CTRL1 is shown in 図 8-93 and described in 表 8-111.

Return to the Summary Table.

Control register for adaptive gate drive voltage thresholds, pull down setting, and active half-bridge configuration.

図 8-93. AGD_CTRL1 Register

7	6	5	4	3	2	1	0

9 Application Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

The DRV871x-Q1 is a highly configurable mult-channel half-bridge MOSFET gate driver than can be used to drive a variety of different output loads. The design examples below highlight how to use and configure the device for different application use cases.

9.2 Typical Application

The typical application for the DRV8718-Q1 is to control an multiple external MOSFET half-bridges for driving multiple uni-directional or bi-directional brushed DC motors. A high-level schematic example is shown below.

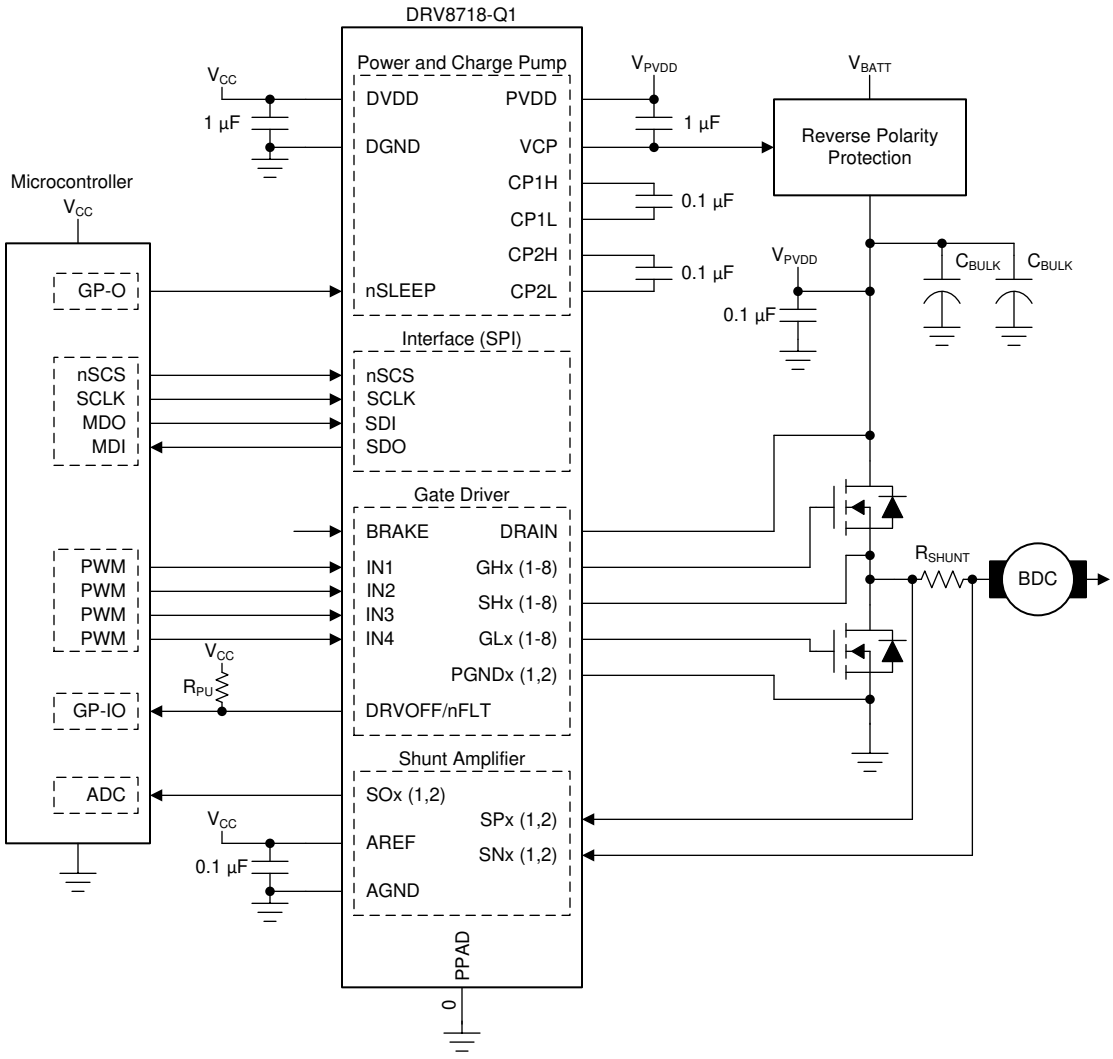

図 9-1. DRV8718-Q1 Typical Application

Copyright © 2024 Texas Instruments Incorporated

9.2.1 Design Requirements

表 9-1 lists a set of example input parameters for the system design.

表 9-1. Example Design Parameters

Design Parameter	Reference	Value
PVDD Nominal Supply Voltage	V_{PVDD}	12 V
PVDD Supply Voltage Range		9 to 18 V
DVDD / AREF Logic Supply Voltage	V_{CC}	3.3V
MOSFET Total Gate Charge	Q_G	30 nC (typical) at V_{GS} = 10 V
MOSFET Gate to Drain Charge	Q_{GD}	5 nC (typical)
MOSFET On Resistance	$R_{DS(on)}$	4 mΩ
Target Output Rise Time	t_{rise}	750 - 1000 ns
Target Output Fall Time	t_{fall}	250 - 500 ns
PWM Frequency	f_{PWM}	20 kHz
Maximum Motor Current	I_{MAX}	25 A
Shunt Resistor Power Capability	P_{SHUNT}	3 W

9.2.2 Detailed Design Procedure

9.2.2.1 Gate Driver Configuration

9.2.2.1.1 VCP Load Calculation Example

It should be ensured that the charge pump load capability is sufficient for the type of external MOSFET, number of PWM half-bridges, and desired PWM frequency. This can be confirmed with a simple calculation as shown in 式 1. Since the charge pump supplies both the high-side and low-side gate drivers, the number of both switching high-side and low-side MOSFETs should be taken into consideration. This will depend on both the number of PWM half-bridges and the freewheeling mode (if the opposite MOSFET is being switched).

$$I_{VCP}\ (A) = Q_G\ (C) \times f_{PWM}\ (Hz) \times \#\ \text{of switching FETs} \quad (1)$$

Using the input design parameters as an example, we can show that in this scenario that output load capability of the charge pump is sufficient in 式 2. For this example, four active half-bridges were assumed with active freewheeling totaling 8 switching MOSFETs.

$$I_{VCP} = 30\ nC \times 20\ kHz \times 8 = 4.8\ mA \quad (2)$$

9.2.2.1.2 I_{DRIVE} Calculation Example

The gate drive current strength, I_{DRIVE}, is selected based on the gate-to-drain charge of the external MOSFETs and the target rise and fall times at the switch-node. If I_{DRIVE} is selected to be too low for a given MOSFET, then the MOSFET may not turn on or off completely within the configured t_{DRIVE} time and a gate fault may be asserted. Additionally, slow rise and fall times will lead to higher switching power losses in the external power MOSFETs. It is recommended to verify these values in system with the required external MOSFETs and load to determine the optimal settings.

The I_{DRIVEP} and I_{DRIVEN} for both the high-side and low-side external MOSFETs are adjustable on SPI device variants. On hardware interface device variants, both source and sink settings are selected simultaneously on the IDRIVE pin.

For MOSFETs with a known gate-to-drain charge (Q_{GD}), desired rise time (t_{rise}), and a desired fall time (t_{fall}), use 式 3 and 式 4 to calculate the approximate values of I_{DRIVEP} and I_{DRIVEN} (respectively).

$$I_{DRIVEP} = Q_{GD} / t_{rise} \quad (3)$$

$$I_{DRIVEN} = Q_{GD} / t_{fall} \quad (4)$$

Copyright © 2024 Texas Instruments Incorporated

Using the input design parameters as an example, we can calculate the approximate values for I_{DRIVEP} and I_{DRIVEN}.

$$I_{DRIVEP\_HI} = 5\ nC / 750\ ns = 6.67\ mA \quad (5)$$

$$I_{DRIVEP\_LO} = 5\ nC / 1000\ ns = 5\ mA \quad (6)$$

Based on these calculations a value of 6 mA was chosen for I_{DRIVEP}.

$$I_{DRIVEN\_HI} = 5\ nC / 250\ ns = 20\ mA \quad (7)$$

$$I_{DRIVEN\_LO} = 5\ nC / 500\ ns = 10\ mA \quad (8)$$

Based on these calculations, a value of 16 mA was chosen for I_{DRIVEN}.

9.2.2.1.3 t_{DRIVE} Calculation Example

The driver gate to source monitor timeout (t_{DRIVE}) should be configured to allow sufficient time for the external MOSFETs to charge and discharge for the selected I_{DRIVE} gate current. By default, the setting is 8us which is sufficient for many systems. The determine an appropriate t_{DRIVE} value, 式 9 can be utilized.

$$t_{DRIVE} > Q_{G\_TOT} / I_{DRIVE} \quad (9)$$

Using the input design parameters as an example, we can calculate the approximate values for t_{DRIVE}.

$$t_{DRIVE} > 30\ nC / 6\ mA = 5\ us \quad (10)$$

Based on these calculations a value of 8 us was chosen for t_{DRIVE}.

9.2.2.1.4 Maximum PWM Switching Frequency

The maximum PWM frequency of the driver is typically determined by multiple factors in the system. While the DRV871x-Q1 device can support up to 100kHz, system parameters may limit this to a lower value.

These system parameters include:

- The rise and fall times of the external MOSFETs.
- The MOSFET Q_G and load on the charge pump.
- The minimum and maximum duty cycle requirements (Ex. 10% to 90%)

9.2.2.2 Current Shunt Amplifier Configuration

The DRV871x-Q1 differential shunt amplifier gain and shunt resistor value are selected based on the dynamic current range, reference voltage supply, shunt resistor power rating, and operating temperature range. In bidirectional operation of the shunt amplifier, the dynamic range at the output is approximately calculated as shown in 式 11. The output of the amplifier can swing from the midpoint reference (V_{AREF} / 2) to either 0.25 V or V_{AREF} - 0.25V depending on the polarity of the input voltage to the amplifier.

$$V_{SO\_BI} = (V_{AREF} - 0.25\ V) - (V_{AREF} / 2) \quad (11)$$

If only unidirectional current sensing is required, the amplifier reference can be modified to expand the dynamic range at the output. The is modified through the CSA_DIV SPI register setting. In this mode, the dynamic range at the output is approximately calculated as shown in 式 12.

$$V_{SO\_UNI} = (V_{AREF} - 0.25\ V) - (V_{AREF} / 8) \quad (12)$$

Based on V_{AREF} = 3.3 V, the dynamic out range in both bidirectional or unidirectional sensing can be calculated as shown below:

Copyright © 2024 Texas Instruments Incorporated

$$V_{SO\_BI} = (3.3\ V - 0.25\ V) - (3.3\ V / 2) = 1.4\ V \quad (13)$$

$$V_{SO\_UNI} = (3.3\ V - 0.25\ V) - (3.3\ V / 8) = 2.6375\ V \quad (14)$$

The external shunt resistor value and shunt amplifier gain setting are selected based on the available dynamic output range, the shunt resistor power rating, and maximum motor current that needs to be measured. This exact values for the shunt resistance and amplifier gain are determine by both 式 15 and 式 16.

$$R_{SHUNT} < P_{SHUNT} / I_{MAX}^{2} \quad (15)$$

$$A_V < V_{SO} / (I_{MAX} \times R_{SHUNT}) \quad (16)$$

Based on V_{SO} = 1.4 V, I_{MAX} = 25 A and P_{SHUNT} = 3 W, the values for shunt resistance and amplifier gain can be calculated as shown below:

$$R_{SHUNT} < 3\ W / 25^2\ A = 4.8\ m\Omega \quad (17)$$

$$A_V < 1.4\ V / (25\ A \times 4.8\ m\Omega) = 11.67\ V/V \quad (18)$$

Based on the results, a shunt resistance of 4 mΩ and an amplifier gain of 10 V/V can be selected.

9.2.2.3 Power Dissipation

In high ambient operating environments, it may be important to estimate the internal self heating of the driver. To determine the temperature of the device, first the internal power dissipation must be calculate. After this an estimate can be made with the device package thermal properties.

The internal power dissipation has four primary components.

- High-Side Driver Power Dissipation (P_{HS})
- Low-Side Driver Power Dissipation (P_{LS})
- PVDD Battery Supply Power Dissipation (P_{PVDD})
- DVDD/AREF Logic/Reference Supply Power Dissipation (P_{VCC})

The values for P_{HS} and P_{LS} can be approximated by referencing the earlier equation for charge pump load current as shown below. In a typical switch scenario, 4 high-side and 4 low-side MOSFET are switching.

$$I_{HS/LS}\ (A) = Q_G\ (C) \times f_{PWM}\ (Hz) \times \#\ of\ switching\ FETs \quad (19)$$

Using the input design parameters as an example, we can calculate the current load from the high-side and low-side drivers.

$$I_{HS} = 30\ nC \times 20\ kHz \times 4 = 2.4\ mA \quad (20)$$

$$I_{LS} = 30\ nC \times 20\ kHz \times 4 = 2.4\ mA \quad (21)$$

From this, the power dissipation can be calculated from the equations below for the driver power dissipation. The high-side and low-side includes a doubling factor to account for the losses in the charge pump supplying the drivers.

$$P_{HS}\ (W) = I_{HS}\ (A) \times V_{PVDD} \times 2 \quad (22)$$

$$P_{LS}\ (W) = I_{LS}\ (A) \times V_{PVDD} \times 2 \quad (23)$$

Using the input design parameters as an example, we can calculate the power dissipation from the high-side and low-side drivers.

$$P_{HS}\ (W) = 0.0576\ W = 2.4\ mA \times 12\ V \times 2 \quad (24)$$

Copyright © 2024 Texas Instruments Incorporated

$$P_{LS}\ (W) = 0.0576\ W = 2.4\ mA \times 12\ V \times 2 \quad (25)$$

The values for P_{PVDD} and P_{VCC} can be approximated by referencing 式 26 and 式 27:

$$P_{PVDD}\ (W) = I_{PVDD}\ (A) \times V_{PVDD} \quad (26)$$

$$P_{VCC}\ (W) = (I_{DVDD}\ (A) \times V_{DVDD}) + (I_{AREF}\ (A) \times V_{AREF}) \quad (27)$$

Using the input design parameters as an example, we can calculate the power dissipation for the power supplies.

$$P_{PVDD}\ (W) = 0.162\ W = 13.5\ mA \times 12\ V \quad (28)$$

$$P_{VCC}\ (W) = 0.033\ W = (8\ mA \times 3.3\ V) + (2\ mA \times 3.3\ V) \quad (29)$$

Finally, use 式 30 to estimate device junction temperature.

$$T_{JUNCTION}\ (°C) = T_{AMBIENT}\ (°C) + (R_{\theta JA}\ (°C/W) \times P_{TOT}(W)) \quad (30)$$

Using the previously calculated power dissipation values and the device thermal parameter from the Thermal Information table can estimate the device internal temperature:

$$T_{JUNCTION}\ (°C) = 112.9\ °C = 105\ °C + (25.6\ °C/W \times 0.3102\ W) \quad (31)$$

図 9-7. Power Off Braking Disabled

9.3 Initialization

This section provides some guidance for getting started with the DRV871x-Q1 for typical system operation.

- By default, the device is in a low-powered sleep mode with the nSLEEP pin low. In this mode, all drivers are disabled and no device communication is possible. The nSLEEP pin should be driven high, to enter its standby state.
- In the standby state, H/W interface device variants will immediately enter the active state allowing for driver operation (device settings will be derived from the pin configurations), but SPI interface device variants will power up with the drivers still disabled.
- On SPI variants, the drivers are enabled through the EN_DRV register bit. But before enabling drivers, it is recommended to configure the output drivers, sense amplifiers, setup protection circuits, and run offline diagnostics.
- The half-bridge driver PWM configurations are set through the BRG_CTRL1,2 and PWM_CTRL1,2 register and will be dependent on the output load configuration. Additionally the driver gate current level and gate driver configurations can be set through the IDRV_CTRLx and DRV_CTRLx registers.
- The sense amplifiers are configured through the CSA_CTRL1, 2, and 3 registers.
- The various protection functions can be configured through the VDS_CTRLx and UVOV_CTRL registers.
- Lastly, before enabling the drivers, offline diagnostics can be performed for open load and short circuit through the EN_OLSC and the OLSC_CTRL1,2 registers.

9.4 Power Supply Recommendations

9.4.1 Bulk Capacitance Sizing

Having appropriate local bulk capacitance is an important factor in motor drive system design. Having more bulk capacitance is generally beneficial, while the disadvantages are increased cost and physical size. The amount of local capacitance depends on a variety of factors including:

- The highest current required by the motor system
- The power supply's type, capacitance, and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable supply voltage ripple

Copyright © 2024 Texas Instruments Incorporated

- Type of motor (brushed DC, brushless DC, stepper)
- The motor startup and braking methods

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet provides a recommended minimum value, but system level testing is required to determine the appropriate sized bulk capacitor.

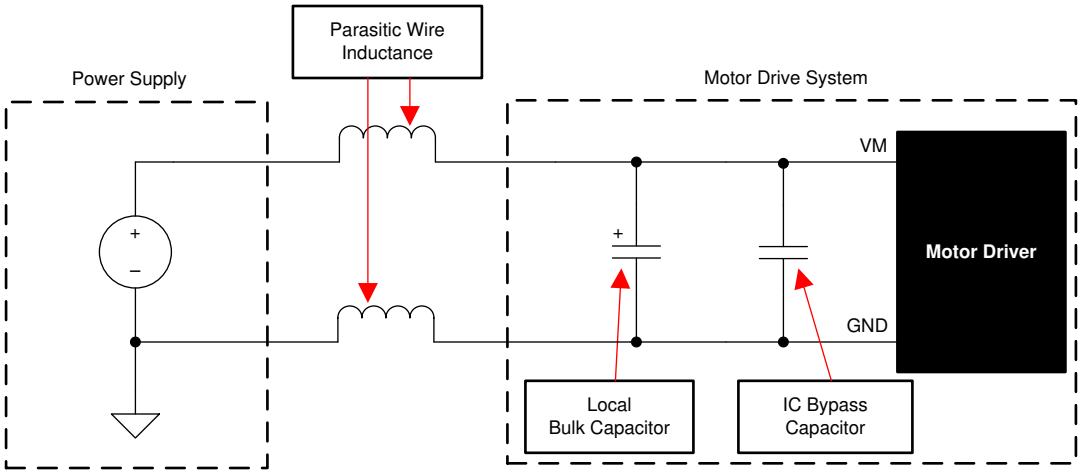

図 9-8. Motor Drive Supply Parasitics Example

9.5 Layout

9.5.1 Layout Guidelines

Bypass the PVDD pin to the GND pin using a low-ESR ceramic bypass capacitor with a recommended value of 0.1 µF. Place this capacitor as close to the PVDD pin as possible with a thick trace or ground plane connected to the GND pin. Additionally, bypass the PVDD pin using a bulk capacitor rated for PVDD. This component can be electrolytic. This capacitance must be at least 10 µF. It is acceptable if this capacitance is shared with the bulk capacitance for the external power MOSFETs.

Additional bulk capacitance is required to bypass the high current path on the external MOSFETs. This bulk capacitance should be placed such that it minimizes the length of any high current paths through the external MOSFETs. The connecting metal traces should be as wide as possible, with numerous vias connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Place a low-ESR ceramic capacitor between the CPL1 / CPH1 and CPL2 / CP2H pins. The CP1 capacitor should be 0.1 µF, rated for PVDD, and be of type X5R or X7R. The CP2 capacitor should be 0.1 µF, rated for PVDD + 16 V, and be of type X5R or X7R. Additionally, place a low-ESR ceramic capacitor between the VCP and PVDD pins. This capacitor should be 1 µF, rated for 16 V, and be of type X5R or X7R.

Bypass the DVDD pin to the DGND pin with a 1.0 µF low-ESR ceramic capacitor rated for 6.3 V and of type X5R or X7R. Place this capacitor as close to the pin as possible and minimize the path from the capacitor to the DGND pin. Bypass the AREF pin to the AGND pin with a 0.1 µF low-ESR ceramic capacitor rated for 6.3 V and of type X5R or X7R. Place this capacitor as close to the pin as possible and minimize the path from the capacitor to the AGND pin. If local bypass capacitors are already present on these power supplies in close proximity of the device to minimize noise, these additional components for DVDD and/or AREF are not required.

The DRAIN pin can be shorted directly to the PVDD pin. However, if a significant distance is between the device and the external MOSFETs, use a dedicated trace to connect to the common point of the drains of the high-side external MOSFETs. Ensure the PGNDx pins have a low impedance path to the sources of the low-side external

Copyright © 2024 Texas Instruments Incorporated

MOSFETs and to the PCB GND plane.. pins directly to the GND plane. These recommendations allow for more accurate VDS sensing of the external MOSFETs for overcurrent detection.

Minimize the loop length for the high-side and low-side gate drivers. The high-side loop is from the GHx pin of the device to the high-side power MOSFET gate, then follows the high-side MOSFET source back to the SHx pin. The low-side loop is from the GLx pin of the device to the low-side power MOSFET gate, then follows the low-side MOSFET source back to the PGNDx pin.

10.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。 変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

10.3 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの使用条件を参照してください。

10.4 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.
すべての商標は、それぞれの所有者に帰属します。

10.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

10.6 用語集

テキサス・インスツルメンツ用語集　　この用語集には、用語や略語の一覧および定義が記載されています。

11 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision C (August 2022) to Revision D (December 2022)	Page
• Added the DRV8714A-Q1 variant	3

Changes from Revision B (June 2021) to Revision C (August 2022)	Page
• QFP パッケージ オプションの情報を追加	1

Copyright © 2024 Texas Instruments Incorporated

Changes from Revision A (December 2020) to Revision B (June 2021)	Page
• V_{OFF} specification improved to +/- 1mV	14
• Amplifier CMRR MIN specification added	14
• Removed typo reference to ADDR_FLT	58

Changes from Revision * (August 2020) to Revision A (December 2020)	Page
• データシートのステータスを「事前情報」から「量産混合」に変更	1

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. (1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
