

## ISO154x-Q1 低消費電力の双方向 I<sup>2</sup>C アイソレータ

### 1 特長

- 車載アプリケーション認定済み
- 下記内容で AEC-Q100 認定済み:
  - デバイス温度グレード 1: -40°C ~ +125°C の動作時周囲温度範囲
  - デバイス HBM ESD 分類レベル 3A
  - デバイス CDM ESD 分類レベル C6
- 機能安全対応
  - 機能安全システムの設計に役立つ資料を利用可能な [ISO1540-Q1](#)、[ISO1541-Q1](#)
- 絶縁型双方向、I<sup>2</sup>C 互換、通信
- 最高 1MHz での動作に対応
- 電源電圧範囲: 3V ~ 5.5V
- オープン・ドレイン出力、サイド 1 で 3.5mA、サイド 2 で 35mA のシンク電流能力
- ±50kV/μs の過渡耐性 (標準値)
- 安全関連の認証:
  - DIN EN IEC 60747-17 (VDE 0884-17) に準拠した絶縁耐圧: 4242V<sub>PK</sub>
  - UL 1577 に準拠した絶縁耐圧: 2500V<sub>RMS</sub> (1 分間)
  - IEC 62368-1 最終機器標準準拠の CSA 認定
  - GB4943.1-2011 に準拠した CQC 基本絶縁

### 2 アプリケーション

- 電気自動車、ハイブリッド電気自動車
- 絶縁 I<sup>2</sup>C バス
- SMBus および PMBus インターフェイス
- オープン・ドレイン・ネットワーク
- モータ制御システム
- バッテリー管理
- I<sup>2</sup>C のレベル・シフト

### 3 概要

ISO1540-Q1 および ISO1541-Q1 デバイスは、低消費電力の双方向アイソレータで、I<sup>2</sup>C インターフェイスと互換性があります。これらのデバイスにはロジック入力および出力バッファがあり、二酸化ケイ素 (SiO<sub>2</sub>) バリアを使用したテキサス・インスツルメンツの容量性絶縁テクノロジーによって分離されています。これらのデバイスは、絶縁型電源と組み合わせて使用することで、高電圧を遮断し、グラウンドを絶縁し、ノイズ電流がローカル・グラウンドに入り込んでノイズに敏感な回路に干渉したり損傷を与えたりすることを防止します。

この絶縁テクノロジーにより、フォトカプラと比較して機能、性能、サイズ、消費電力が優れています。ISO1540-Q1 および ISO1541-Q1 デバイスにより、小さなフォーム・ファクタ内に、完全に絶縁された I<sup>2</sup>C インターフェイスを実装できます。

ISO1540-Q1 にはクロックおよびデータ・ライン用の 2 つの絶縁された双方向チャンネルがあり、ISO1541-Q1 には双方向のデータ・チャンネルと単方向のクロック・チャンネルがあります。ISO1541-Q1 は 1 つのコントローラを持つアプリケーションに、ISO1540-Q1 は複数のコントローラを持つアプリケーションに適しています。ターゲットによるクロックのストレッチが可能なアプリケーションでは、ISO1540-Q1 デバイスを使用する必要があります。

絶縁された双方向通信は、これらのデバイス内で、サイド 1 の Low レベル出力電圧を、サイド 1 の High レベル入力電圧より高い値にオフセットすることによって行われるため、標準のデジタル・アイソレータで発生するような内部的なロジック・ラッチを防止できます。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

		MIN	MAX	UNIT
Voltage	VCC1, VCC2	-0.5	6	V
	SDA1, SCL1	-0.5	VCC1 + 0.5 <sup>(3)</sup>	
	SDA2, SCL2	-0.5	VCC2 + 0.5 <sup>(3)</sup>	
I <sub>O</sub> Output current	SDA1, SCL1	0	20	mA
	SDA2, SCL2	0	100	
T <sub>J(MAX)</sub> Maximum junction temperature			150	°C
T <sub>stg</sub> Storage temperature		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values here within are with respect to the local ground pin (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	All pins except bus pins	±4000	V
		Bus pins	±8000	
	Charged-device model (CDM), per AEC Q100-011		±1500	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
VCC1, VCC2	Supply voltage	3	5.5	V
V <sub>SDA1</sub> , V <sub>SCL1</sub>	Input and output signal voltages, side 1	0	VCC1	V
V <sub>SDA2</sub> , V <sub>SCL2</sub>	Input and output signal voltages, side 2	0	VCC2	V
V <sub>IL1</sub>	Low-level input voltage, side 1	0	0.5	V
V <sub>IH1</sub>	High-level input voltage, side 1	0.7 × VCC1	VCC1	V
V <sub>IL2</sub>	Low-level input voltage, side 2	0	0.3 × VCC2	V
V <sub>IH2</sub>	High-level input voltage, side 2	0.7 × VCC2	VCC2	V
I <sub>OL1</sub>	Output current, side 1	0.5	3.5	mA
I <sub>OL2</sub>	Output current, side 2	0.5	35	mA
C1	Capacitive load, side 1		40	pF
C2	Capacitive load, side 2		400	pF
f <sub>MAX</sub>	Operating frequency <sup>(1)</sup>		1	MHz
T <sub>A</sub>	Ambient temperature	-40	125	°C
T <sub>J</sub>	Junction temperature	-40	136	°C
T <sub>SD</sub>	Thermal shutdown	139	197	°C

- (1) This represents the maximum frequency with the maximum bus load (C) and the maximum current sink (I<sub>O</sub>). If the system has less bus capacitance, then higher frequencies can be achieved.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ISO154x-Q1	UNIT
		D (SOIC)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	114.6	°C/W

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (4) All pins on each side of the barrier tied together creating a two-terminal device

## 6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>S</sub>	Safety input, output, or supply current	R <sub>θJA</sub> = 114.6°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">6-1</a>			198	mA
		R <sub>θJA</sub> = 114.6°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">6-1</a>			303	
T <sub>S</sub>	Safety temperature				150	°C

The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [セクション 6.4](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

## 6.9 Electrical Characteristics

<b>BOTH SIDES</b>						
$ I_{i} $	Input leakage currents, SDA1, SCL1, SDA2, and SCL2	$V_{SDA1}, V_{SCL1} = V_{CC1};$ $V_{SDA2}, V_{SCL2} = V_{CC2}$		0.01	10	$\mu\text{A}$
$C_i$	Input capacitance to local ground, SDA1, SCL1, SDA2, and SCL2	$V_i = 0.4 \times \sin(2E6\pi t) + 2.5 \text{ V}$		7		pF
CMTI	Common-mode transient immunity	See <a href="#">7-3</a>	25	50		kV/ $\mu\text{s}$
$V_{CCUV}$	VCC undervoltage lockout threshold <sup>(3)</sup>		1.7	2.5	2.9	V

- (1) This parameter does not apply to the ISO1541-Q1 SCL1 line as it is unidirectional.
- (2)  $\Delta V_{OIT1} = V_{OL1} - V_{IHT1}$ . This represents the minimum difference between a Low-Level Output Voltage and a High-Level Input Voltage Threshold to prevent a permanent latch condition that would otherwise exist with bidirectional communication.
- (3) Any VCC voltages, on either side, less than the minimum will ensure device lockout. Both VCC voltages greater than the maximum will prevent device lockout.

## 7 Detailed Description

### 7.1 Overview

The I<sup>2</sup>C bus is used in a wide range of applications because it is simple to use. The bus consists of a two-wire communication bus that supports bidirectional data transfer between a controller device and several target devices. The controller, or processor, controls the bus, specifically the serial clock (SCL) line. Data is transferred between the controller and target through a serial data (SDA) line. This data can be transferred in four speeds: standard mode (0 to 100 kbps), fast mode (0 to 400 kbps), fast-mode plus (0 to 1 Mbps), and high-speed mode (0 to 3.4 Mbps). The most common speeds are the standard and fast modes.

The I<sup>2</sup>C bus operates in bidirectional, half-duplex mode, while standard digital isolators are unidirectional devices. To make efficient use of one technology supporting the other, external circuitry is required that separates the bidirectional bus into two unidirectional signal paths without introducing significant propagation delay. These devices have their logic input and output buffers separated by TI's capacitive isolation technology using a silicon dioxide (SiO<sub>2</sub>) barrier. When used in conjunction with isolated power supplies, these devices block high voltages, isolate grounds, and prevent noise currents from entering the local ground and interfering with or damaging sensitive circuitry.

### 7.3 Feature Description

The device enables a complete isolated I<sup>2</sup>C interface to be implemented within a small form factor having the features listed in 表 7-1.

ISO1541-Q1	Unidirectional (SCL) Bidirectional (SDA)		

(1) See セクション 6.7 for detailed Isolation specifications.

### 7.4 Isolator Functional Principle

To isolate a bidirectional signal path (SDA or SCL), the ISO1540-Q1 internally splits a bidirectional line into two unidirectional signal lines, each of which is isolated through a single-channel digital isolator. Each channel output is made open-drain to comply with the open-drain technology of I<sup>2</sup>C. Side 1 of the ISO1540-Q1 connects to a low-capacitance I<sup>2</sup>C node, while side 2 is designed for connecting to a fully loaded I<sup>2</sup>C bus with up to 400 pF of capacitance.

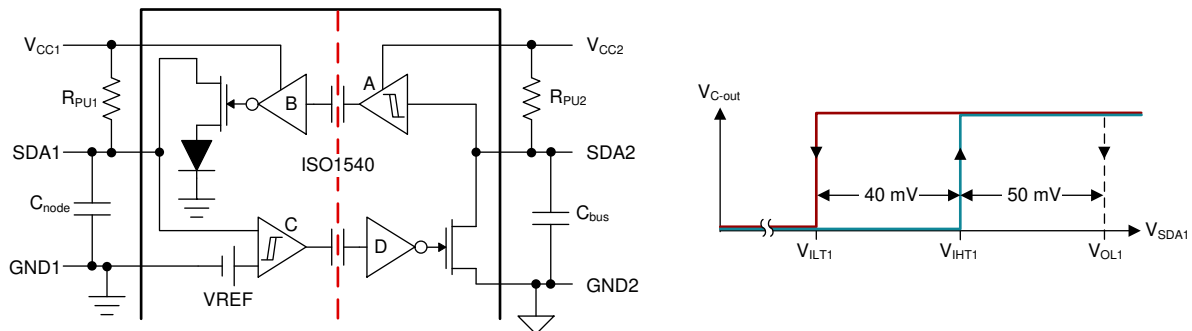

图 7-3. SDA Channel Design and Voltage Levels at SDA1

At first sight, the arrangement of the internal buffers suggests a closed signal loop that is prone to latch-up. However, this loop is broken by implementing an output buffer (B) whose output low-level is raised by a diode drop to approximately 0.75 V, and the input buffer (C) that consists of a comparator with defined hysteresis. The

comparator's upper and lower input thresholds then distinguish between the proper low-potential of 0.4 V (maximum) driven directly by SDA1 and the buffered output low-level of B.

Figure 7-4 demonstrate the switching behavior of the I<sup>2</sup>C isolator, ISO1540-Q1, between a controller node at SDA1 and a heavy loaded bus at SDA2.

**Figure 7-4. SDA Channel Timing in Receive and Transmit Directions**

#### 7.4.1 Receive Direction (Left Diagram of )

When the I<sup>2</sup>C bus drives SDA2 low, SDA1 follows after a certain delay in the receive path. The output low is the buffered output of  $V_{OL1} = 0.75\text{ V}$ , which is sufficiently low to be detected by Schmitt-trigger inputs with a minimum input-low voltage of  $V_{IL} = 0.9\text{ V}$  at 3 V supply levels.

When SDA2 is released, its voltage potential increases towards VCC2 following the time-constant formed by  $R_{PU2}$  and  $C_{bus}$ . After the receive delay, SDA1 is released and also rises towards VCC1, following the time-constant  $R_{PU1} \times C_{node}$ . Because of the significant lower time-constant, SDA1 may reach VCC1 before SDA2 reaches VCC2 potential.

#### 7.4.2 Transmit Direction (Right Diagram of )

When a controller drives SDA1 low, SDA2 follows after a certain delay in the transmit direction. When SDA2 turns low it also causes the output of buffer B to turn low but at a higher 0.75 V level. This level cannot be observed immediately as it is overwritten by the lower low-level of the controller.

However, when the controller releases SDA1, the voltage potential increases and first must pass the upper input threshold of the comparator,  $V_{IHT1}$ , to release SDA2. SDA1 then increases further until it reaches the buffered output level of  $V_{OL1} = 0.75\text{ V}$ , maintained by the receive path. When comparator C turns high, SDA2 is released after the delay in transmit direction. It takes another receive delay until B's output turns high and fully releases SDA1 to move toward VCC1 potential.

### 7.5 Device Functional Modes

Table 7-2 lists the ISO154x-Q1 functional modes.

## 8 Application and Implementation

注

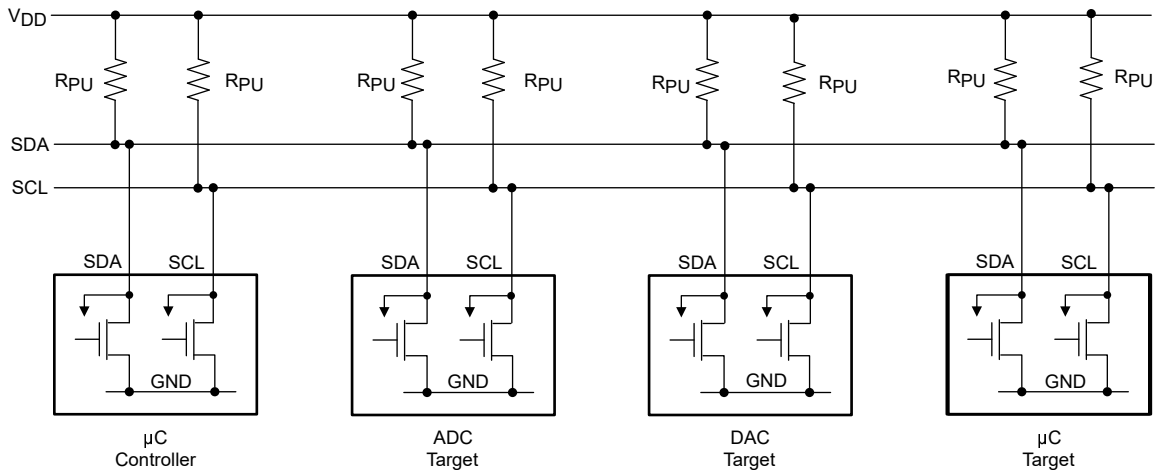

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

#### 8.1.1 I<sup>2</sup>C Bus Overview

The inter-integrated circuit (I<sup>2</sup>C) bus is a single-ended, multi-controller, 2-wire bus for efficient inter-IC communication in half-duplex mode.

I<sup>2</sup>C uses open-drain technology, requiring two lines, serial data (SDA) and serial clock (SCL), to be connected to VDD by resistors (see [Figure 8-1](#)). Pulling the line to ground is considered a logic zero while letting the line float is a logic one. This logic is used as a channel access method. Transitions of logic states must occur while the SCL pin is low. Transitions while the SCL pin is high indicate START and STOP conditions. Typical supply voltages are 3.3 V and 5 V, although systems with higher or lower voltages are allowed.

**Figure 8-1. I<sup>2</sup>C Bus**

I<sup>2</sup>C communication uses a 7-bit address space with 16 reserved addresses, so a theoretical maximum of 112 nodes can communicate on the same bus. In practice, however, the number of nodes is limited by the specified, total bus capacitance of 400 pF, which restricts communication distances to a few meters.

The specified signaling rates for the ISO1540-Q1 and ISO1541-Q1 devices are 100 kbps (standard mode), 400 kbps (fast mode), 1 Mbps (fast mode plus).

The bus has two roles for nodes: controller and target. A controller node issues the clock and target addresses, and also initiates and ends data transactions. A target node receives the clock and addresses and responds to requests from the controller. [Figure 8-2](#) shows a typical data transfer between controller and target.

**8-2. Timing Diagram of a Complete Data Transfer**

The controller initiates a transaction by creating a START condition, following by the 7-bit address of the target it wishes to communicate with. This is followed by a single read and write (R/W) bit, representing whether the controller wishes to write to 0, or to read from 1 the target. The controller then releases the SDA line to allow the target to acknowledge the receipt of data.

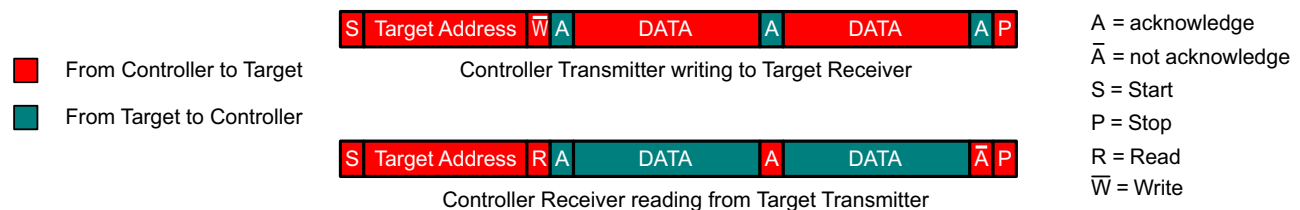

The target responds with an acknowledge bit (ACK) by pulling the SDA pin low during the entire high time of the 9th clock pulse on the SCL signal, after which the controller continues in either transmit or receive mode (according to the R/W bit sent), while the target continues in the complementary mode (receive or transmit, respectively).

The address and the 8-bit data bytes are sent most significant bit (MSB) first. The START bit is indicated by a high-to-low transition of SDA while SCL is high. The STOP condition is created by a low-to-high transition of SDA while SCL is high.

If the controller writes to a target, it repeatedly sends a byte with the target sending an ACK bit. In this case, the controller is in controller-transmit mode and the target is in target-receive mode.

If the controller reads from a target, it repeatedly receives a byte from the target, while acknowledging (ACK) the receipt of every byte but the last one (see 8-3). In this situation, the controller is in controller-receive mode and the target is in target-transmit mode.

The controller ends the transmission with a STOP bit, or may send another START bit to maintain bus control for further transfers.

**8-3. Transmit or Receive Mode Changes During a Data Transfer**

When writing to a target, a controller mainly operates in transmit-mode and only changes to receive-mode when receiving acknowledgment from the target.

When reading from a target, the controller starts in transmit-mode and then changes to receive-mode after sending a READ request (R/W bit = 1) to the target. The target continues in the complementary mode until the end of a transaction.

**注**

The controller ends a reading sequence by not acknowledging (NACK) the last byte received. This procedure resets the target state machine and allows the controller to send the STOP command.

## 8.2 Typical Application

Figure 8-4 shows an isolated I<sup>2</sup>C data acquisition system built with TI microcontroller, analog-to-digital converter, and I<sup>2</sup>C isolator, ISO1541-Q1.

The entire circuit operates from a single 3.3-V supply. A low-power push-pull converter, SN6501-Q1, drives a center-tapped transformer with an output that is rectified and linearly regulated to provide a stable 5-V supply for the data converter.

### 8.2.1 Design Requirements

The recommended power supply voltages (VCC1 and VCC2) must be from 3 V to 5.5 V. A recommended decoupling capacitor with a value of 0.1 µF is required between both the VCC1 and GND1 pins, and the VCC2 and GND2 pins to support of power supply voltages transient and to ensure reliable operation at all data rates.

### 8.2.2 Detailed Design Procedure

The power-supply capacitor with a value of 0.1-µF must be placed as close to the power supply pins as possible. The recommended placement of the capacitors must be 2-mm maximum from input and output power supply pins (VCC1 and VCC2).

The maximum load permissible on the input lines, SDA1 and SCL1, is ≤ 40 pF and on the output lines, SDA2 and SCL2, is ≤ 400 pF.

The minimum pullup resistors on the input lines, SDA1 and SCL1 to VCC1 must be selected in such a way that input current drawn is ≤ 3.5 mA. The minimum pullup resistors on the input lines, SDA2 and SCL2, to VCC2 must be selected in such a way that output current drawn is ≤ 35 mA. The maximum pullup resistors on the input

lines (SDA1 and SCL1) to VCC1 and on output lines (SDA1 and SCL1) to VCC2, depends on the load and rise time requirements on the respective lines.

## 9 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, TI recommends connecting a 0.1- $\mu$ F bypass capacitor at the input and output supply pins (VCC1 and VCC2). The capacitors should be placed as close to the supply pins as possible. If only a single, primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as TI's [SN6501-Q1](#) device. For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501-Q1 Transformer Driver for Isolated Power Supplies](#) (SLLSEF3).

## 10 Layout

### 10.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 10-1](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, see the [Digital Isolator Design Guide](#) (SLLA284)

#### 10.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
