IWR1843AOP アンテナ・オン・パッケージ (AOP)、シングルチップ、77～79GHz FMCW ミリ波センサ

1 特長

- FMCW トランシーバ
  - 4 つのレシーバと 3 つのトランスミッタを内蔵したアンテナ・オン・パッケージ (AOP)
  - PLL、トランスミッタ、レシーバ、ベースバンド、ADC を内蔵
  - 76～81GHz 帯で使用可能帯域幅 4GHz
  - フラクショナル N PLL を使用した超高精度のチャープ・エンジン
  - TX 実効等方放射電力 (EIRP):16dBm
  - RX 実効等方ノイズ指数:10dB (76～81GHz)
  - 1MHz での位相ノイズ:
    - -95dBc/Hz (76～77GHz)
    - -93dBc/Hz (77～81GHz)
- 較正および自己テスト (監視機能) を内蔵
  - Arm® Cortex®-R4F ベースの無線制御システム
  - 内蔵ファームウェア (ROM)
  - プロセスおよび温度の自己較正システム
- FMCW 信号処理用の C674x DSP
- オンチップ・メモリ:2MB RAM
- 物体追跡 / 分類およびインターフェイス制御用の Arm Cortex-R4F マイクロコントローラ
  - 自律モード (QSPI フラッシュ・メモリからのユーザー・アプリケーションのロード) をサポート
- ホスト・インターフェイス
  - CAN (2 つのインスタンス、1 つは CAN-FD)
- ユーザー・アプリケーションで利用可能なその他のインターフェイス
  - 最大 6 つの汎用 ADC チャネル
  - 最大 2 つの SPI ポート
  - 最大 2 つの UART
  - I^2C
  - GPIO
  - 未加工 ADC データおよびデバッグ計測機器向け 2 レーン LVDS インターフェイス
- デバイスのセキュリティ (一部の部品番号のみ)
  - セキュアな認証および暗号化ブートのサポート
  - 顧客がプログラム可能なルート・キー、対称キー (256 ビット)、非対称キー (RSA-2K まで)、キー失効機能付き
  - 暗号化ソフトウェア・アクセラレータ - ECC 付き PKA、AES (最大 256 ビット)、SHA (最大 256 ビット)、TRNG / DRGB
- SIL-2 を対象とした機能安全
- IWR1843AOP の高度な機能
  - ホスト・プロセッサの関与を必要としない自己監視機能を内蔵
  - 複素ベースバンド・アーキテクチャ
  - 干渉検出機能を内蔵
  - 送信経路内のプログラム可能な位相ローテーターにより、ビーム形成が可能
- パワー・マネージメント
  - 内蔵 LDO ネットワークにより PSRR の向上を実現
  - I/O は 3.3V/1.8V のデュアル電圧に対応
- クロック・ソース
  - 40MHz の外部発振器をサポート
  - 40MHz の外部駆動クロック (方形波 / 正弦波) をサポート
  - 負荷コンデンサ付きの 40MHz 水晶振動子接続をサポート
- ハードウェア設計が簡単
  - 組み立てが簡単で低コストの PCB を設計できる 0.8mm ピッチ、180 ピン、15mm × 15mm のフリップチップ BGA パッケージ (ALP)
  - 小型ソリューション・サイズ
- 動作条件
  - 接合部温度範囲:-40℃～125℃

2 アプリケーション

- 自動ドア / ゲート
- モーション検出器
- 距離、速度、角度測定向け産業用センサ
- タンクの液量計測レーダー
- 変位検出
- 交通監視
- 近接検出
- セキュリティと監視
- ファクトリ・オートメーションの安全保護
- レベル・トランスミッタ
- 電動自転車
- 駐車場の車止めや輪止め
- オフ・ハイウェイ車両向けセンサ
- 電動キック・スクーター
- 自律制御型の個人用輸送機

3 概要

IWR1843AOP デバイスは、FMCW レーダー・テクノロジを採用した統合型シングルチップ・ミリ波センサであり、最大 4GHz の連続チャープにより 76～81GHz 帯で動作可能です。このデバイスは、テキサス・インスツルメンツの低消費電力 45nm RFCMOS プロセスで製造されています。このソリューションは、超小型のフォームファクタで、かつてないレベルの統合を実現しています。IWR1843AOP は、ビル・オートメーション、ファクトリ・オートメーション、ドローン、マテリアル・ハンドリング、交通監視、サーベイランスといった産業用アプリケーションにおける、低消費電力で自己監視機能を備えた超高精度の産業用レーダー・システムに最適なソリューションです。

IWR1843AOP デバイスは、76～81GHz 帯ミリ波センサの実装を簡単にする自己完結型シングルチップ・ソリューションです。IWR1843AOP は、PLL および A/D コンバータを内蔵する 3TX/4RX システムのモノリシック実装を実現しています。また、IWR1843AOP には、テキサス・インスツルメンツ製レーダー信号処理用高性能 C674x DSP を含む、DSP サブシステムも統合されています。フロントエンドの構成、制御、較正用に ARM R4F プロセッサ・サブシステムも内蔵されています。プログラミング・モデルを変更するだけで、さまざまなセンサを実装でき、マルチモード・センサの実装においては動的再構成にも対応します。ハードウェア・アクセラレータ・ブロック (HWA) はレーダー処理を実行でき、DSP の MIPS を節約して、DSP がより高いレベルのアルゴリズムを実行できるようにします。また本デバイスは、テキサス・インスツルメンツのリファレンス・デザイン、ソフトウェア・ドライバ、構成例、API ガイド、トレーニング、ユーザー・マニュアルを含む完全なプラットフォーム・ソリューションとして提供しています。

5 Device Comparison

表 5-1 shows a comparison between devices, highlighting the differences.

表 5-1. Device Features Comparison

FUNCTION		IWR6843AOP	IWR1843AOP	IWR1843	IWR1642	IWR1443
Antenna on Package (AOP)		Yes	Yes	—	—	—
Number of receivers		4	4	4	4	4
Number of transmitters		3[3]	3[3]	3[3]	2	3
RF frequency range		60 to 64 GHz	76 to 81 GHz	76 to 81 GHz	76 to 81 GHz	76 to 81 GHz
On-chip memory		1.75MB	2MB	2MB	1.5MB	576KB
Max I/F (Intermediate Frequency) (MHz)		10	10	10	5	5
Max real sampling rate (Msps)		25	25	25	12.5	12.5
Max complex sampling rate (Msps)		12.5	12.5	12.5	6.25	6.25
Device Security[1]		Yes	Yes	Yes	Yes	—
Processors						
MCU (Arm Cortex-R4F)		Yes	Yes	Yes	Yes	Yes
DSP (C674x)		Yes	Yes	Yes	Yes	—
Peripherals						
Serial Peripheral Interface (SPI) ports		2	2	2	2	1
Quad Serial Peripheral Interface (QSPI)		Yes	Yes	Yes	Yes	Yes
Inter-Integrated Circuit (I^2C) interface		1	1	1	1	1
Controller Area Network (DCAN) interface		—	1	1	1	1
Controller Area Network (CAN-FD) interface		2	1	1	1	—
Trace		Yes	Yes	Yes	Yes	—
PWM		Yes	Yes	Yes	Yes	—
Hardware In Loop (HIL/DMM)		Yes	Yes	Yes	Yes	—
GPADC		Yes	Yes	Yes	Yes	Yes
LVDS/Debug[2]		Yes	Yes	Yes	Yes	Yes
Hardware accelerator		Yes	Yes	Yes	—	Yes
1-V bypass mode		Yes	Yes	Yes	Yes	Yes
JTAG		Yes	Yes	Yes	Yes	Yes
Product status	Product Preview (PP), Advance Information (AI), or Production Data (PD)	PD[4]	PD[4]	PD[4]	PD[4]	PD[4]

(1) Device security features including Secure Boot and Customer Programmable Keys are available in select devices for only select part variants as indicated by the Device Type identifier in Section 3, Device Information table.
(2) The LVDS interface is not a production interface and is only used for debug.
(3) 3 Tx Simultaneous operation is supported only with 1-V LDO bypass and PA LDO disable mode. In this mode, the 1-V supply needs to be fed on the VOUT PA pin.
(4) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty.

5.1 Related Products

For information about other devices in this family of products or related products see the links that follow.

mmWave Sensors TI's mmWave sensors rapidly and accurately sense range, angle and velocity with less power using the smallest footprint mmWave sensor portfolio for industrial applications.

mmWave IWR The Texas Instruments IWRxxxx family of mmWave Sensors are highly integrated and built on RFCMOS technology operating in 76- to 81-GHz or 60- to 64-GHz frequency band. The devices have a closed-loop PLL for precise and linear chirp synthesis, includes a built-in radio processor (BIST) for RF calibration and safety monitoring. The devices have a very small-form factor, low power consumption, and are highly accurate. Industrial applications from long range to ultra short range can be realized using these devices.

Companion for IWR1843AOP Review products that are frequently purchased or used in conjunction with this product.

Reference Designs for IWR1843AOP TI Designs Reference Design Library is a robust reference design library spanning analog, embedded processor and connectivity. Created by TI experts to help you jump-start your system design, all TI Designs include schematic or block diagrams, BOMs and design files to speed your time to market. C10	VSENSE / GPADC6	VSENSE / GPADC6			IO		

The following list describes the table column headers:

1. **BALL NUMBER:** Ball numbers on the bottom side associated with each signal on the bottom.
2. **BALL NAME:** Mechanical name from package device (name is taken from muxmode 1).
3. **SIGNAL NAME:** Names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 1).
4. **PINCNTL ADDRESS:** MSS Address for PinMux Control
5. **MODE:** Multiplexing mode number: value written to PinMux Cntl register to select specific Signal name for this Ball number. Mode column has bit range value.
6. **TYPE:** Signal type and direction:
   - I = Input
   - O = Output
   - IO = Input or Output
7. **BALL RESET STATE:** The state of the terminal after supplies are stable after power-on-reset (NRESET) is asserted

8. **PULL UP/DOWN TYPE:** indicates the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
   - Pull Up: Internal pullup
   - Pull Down: Internal pulldown
   - An empty box means No pull.
9. Pin Mux Control Value maps to lower 4 bits of register.

IO MUX registers are available in the MSS memory map and the respective mapping to device pins is as follows:

表 6-2. PAD IO Control Registers

Default Pin/Ball Name	Package Ball /Pin (Address)	Pin Mux Config Register
SPI_HOST_INTR	B2	0xFFFFEA00
GPIO_0	M2	0xFFFFEA04
GPIO_1	L3	0xFFFFEA08
SPIA_MOSI	F2	0xFFFFEA0C
SPIA_MISO	D1	0xFFFFEA10
SPIA_CLK	D2	0xFFFFEA14
SPIA_CS_N	C2	0xFFFFEA18

The register layout is as follows:

表 6-3. PAD IO Register Bit Descriptions

BIT	FIELD	TYPE	RESET (POWER ON DEFAULT)	DESCRIPTION
31-11	NU	RW	0	Reserved
10	SC	RW	0	IO slew rate control: 0 = Higher slew rate 1 = Lower slew rate
9	PUPDSEL	RW	0	Pullup/PullDown Selection 0 = Pull Down 1 = Pull Up (This field is valid only if Pull Inhibit is set as '0')
8	PI	RW	0	Pull Inhibit/Pull Disable 0 = Enable 1 = Disable
7	OE_OVERRIDE	RW	1	Output Override
6	OE_OVERRIDE_CTRL	RW	1	Output Override Control: (A '1' here overrides any o/p manipulation of this IO by any of the peripheral block hardware it is associated with for example a SPI Chip select)
5	IE_OVERRIDE	RW	0	Input Override
4	IE_OVERRIDE_CTRL	RW	0	Input Override Control: (A '1' here overrides any i/p value on this IO with a desired value)
3-0	FUNC_SEL	RW	1	Function select for Pin Multiplexing (Refer to the Pin Mux Sheet)

6.3 Signal Descriptions

注

All IO pins of the device (except NERROR IN, NERROR_OUT, and WARM_RESET) are non-failsafe; hence, care needs to be taken that they are not driven externally without the VIO supply being present to the device.

注

The GPIO state during the power supply ramp is not ensured. In case the GPIO is used in the application where the state of the GPIO is critical, even when NRESET is low , a tri-state buffer should be used to isolate the GPIO output from the radar device and a pull resister used to define the required state in the application. The NRESET signal to the radar device could be used to control the output enable (OE) of the tri-state buffer.

6.3.1 Pin Functions - Digital and Analog [ALP Package]

表 6-4 lists the pins by function and describes that function.

表 6-4. Pin Functions - Digital and Analog [ALP Package]

NAME	I/O	DESCRIPTION	NO.
		DIGITAL	
BSS_UART_TX	O	Debug UART Transmit [Radar Block]	D3, E2, K3, L2, U8, U10, U16, V16

表 6-4. Pin Functions - Digital and Analog [ALP Package] (続き)

NAME	I/O	DESCRIPTION	NO.
ADC_VALID	O	When high, indicating valid ADC samples	B2, L3, M2
WARM_RESET	IO	Open drain fail safe warm reset signal. Can be driven from PMIC for diagnostic or can be used as status signal that the device is going through reset.	U13
ANALOG			
NRESET	I	Power on reset for chip. Active low	U11
CLKP	I	In XTAL mode: Differential port for reference crystal In External clock mode: Single ended input reference clock port	A7
CLKM	I	In XTAL mode: Differential port for reference crystal In External clock mode: Connect this port to ground	B7
OSC_CLKOUT	O	Reference clock output from clocking sub system after cleanup PLL (1.4-V output voltage swing).	A14, K3
VBGAP	O	Device's Band Gap Reference Output	A16
VDDIN	Power	1.2V digital power supply	E1, J1, V4, V8, V15
VIN_SRAM	Power	1.2V power rail for internal SRAM	A5, V6, V12
VNWA	Power	1.2V power rail for SRAM array back bias	C1, V7, V14
VIOIN	Power	I/O Supply (3.3V or 1.8V): All CMOS I/Os would operate on this supply	H1, V9
VIOIN_18	Power	1.8V supply for CMOS IO	B1, F1, K1, V11
VIN_18CLK	Power	1.8V supply for clock module	C15, C18
VIOIN_18DIFF	Power	1.8V supply for LVDS port	U2
VPP	Power	Voltage supply for fuse chain	V2
VIN_13RF1	Power	1.3V Analog and RF supply,VIN_13RF1 and VIN_13RF2 could be shorted on the board	J16, J17, J18
VIN_13RF2	Power	1.3V Analog and RF supply	H16, H17, H18
VIN_18BB	Power	1.8V Analog base band power supply	M16, M17, M18
VIN_18VCO	Power	1.8V RF VCO supply	A12, C11
VSS	Ground	Digital ground	A1, A2, E3, F3, N3, P3, R3, T4, T5, T6, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, U1, V1
VSSA	Ground	Analog ground	A6, A8, A11, A13, A15, A17, A18, B6, B8, B9, B10, B11, B12, B13, B14, B15, B16, B17, B18, C6, C7, C8, C12, C13, C14, C16, C17, D16, D17, D18, E16, E17, E18, F16, F17, F18, K16, K17, K18, L16, L17, L18, N16, N17, N18, P16, R16, R17, T17, U17, U18, V17, V18
VOUT_14APLL	O	Internal LDO output	A10
VOUT_14SYNTH	O	Internal LDO output	A9
VOUT_PA	IO	Internal LDO output	G16, G17, G18
Analog Test1 / GPADC1	IO	Analog IO dedicated for ADC service	P18
Analog Test2 / GPADC2	IO	Analog IO dedicated for ADC service	P17
Analog Test3 / GPADC3	IO	Analog IO dedicated for ADC service	R18
Analog Test4 / GPADC4	IO	Analog IO dedicated for ADC service	T18
ANAMUX / GPADC5	IO	Analog IO dedicated for ADC service	C9

7 Specifications

7.1 Absolute Maximum Ratings

PARAMETERS[(1)] [(2)]		MIN	MAX	UNIT
VDDIN	1.2 V digital power supply	–0.5	1.4	V
VIN_SRAM	1.2 V power rail for internal SRAM	–0.5	1.4	V
VNWA	1.2 V power rail for SRAM array back bias	–0.5	1.4	V
VIOIN	I/O supply (3.3 V or 1.8 V): All CMOS I/Os would operate on this supply.	–0.5	3.8	V
VIOIN_18	1.8 V supply for CMOS IO	–0.5	2	V
VIN_18CLK	1.8 V supply for clock module	–0.5	2	V
VIOIN_18DIFF	1.8 V supply for LVDS port	–0.5	2	V
VIN_13RF1 VIN_13RF2	1.3 V Analog and RF supply, VIN_13RF1 and VIN_13RF2 could be shorted on the board.	–0.5	1.45	V
VIN_13RF1 VIN_13RF2	1-V Internal LDO bypass mode. Device supports mode where external Power Management block can supply 1 V on VIN_13RF1 and VIN_13RF2 rails. In this configuration, the internal LDO of the device would be kept bypassed.	–0.5	1.4	V
VIN_18BB	1.8-V Analog baseband power supply	–0.5	2	V
VIN_18VCO supply	1.8-V RF VCO supply	–0.5	2	V
Input and output voltage range	Dual-voltage LVCMOS inputs, 3.3 V or 1.8 V (Steady State)	–0.3V	VIOIN + 0.3	V
	Dual-voltage LVCMOS inputs, operated at 3.3 V/1.8 V (Transient Overshoot/Undershoot) or external oscillator input		VIOIN + 20% up to 20% of signal period	
CLKP, CLKM	Input ports for reference crystal	–0.5	2	V
Clamp current	Input or Output Voltages 0.3 V above or below their respective power rails. Limit clamp current that flows through the internal diode protection cells of the I/O.	–20	20	mA
T_J	Operating junction temperature range	–40	125	°C
T_{STG}	Storage temperature range after soldered onto PC board	–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to V_{SS}, unless otherwise noted.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM)[(1)]	±1000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002	±250	

(1) ANSI/ESDA/JEDEC JS-001 specification.

7.3 Power-On Hours (POH)

JUNCTION TEMPERATURE (T_j)[(1)]	OPERATING CONDITION	NOMINAL CVDD VOLTAGE (V)	POWER-ON HOURS [POH] (HOURS)
90% at 85°C T_j 100% at 105°C T_j	50% duty cycle	1.2	80,000
100% at 85°C T_j			100,000

(1) This information is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

7.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
VDDIN	1.2 V digital power supply	1.14	1.2	1.32	V
VIN_SRAM	1.2 V power rail for internal SRAM	1.14	1.2	1.32	V
VNWA	1.2 V power rail for SRAM array back bias	1.14	1.2	1.32	V
VIOIN	I/O supply (3.3 V or 1.8 V): All CMOS I/Os would operate on this supply.	3.15	3.3	3.45	V
		1.71	1.8	1.89	
VIOIN_18	1.8 V supply for CMOS IO	1.71	1.8	1.9	V
VIN_18CLK	1.8 V supply for clock module	1.71	1.8	1.9	V
VIOIN_18DIFF	1.8 V supply for LVDS port	1.71	1.8	1.9	V
VIN_13RF1 VIN_13RF2	1.3 V Analog and RF supply. VIN_13RF1 and VIN_13RF2 could be shorted on the board	1.23	1.3	1.36	V
VIN_13RF1 (1-V Internal LDO bypass mode) VIN_13RF2 (1-V Internal LDO bypass mode)	Device supports mode where external Power Management block can supply 1 V on VIN_13RF1 and VIN_13RF2 rails. In this configuration, the internal LDO of the device would be kept bypassed.	0.95	1	1.05	V
VIN18BB	1.8-V Analog baseband power supply	1.71	1.8	1.9	V
VIN_18VCO	1.8V RF VCO supply	1.71	1.8	1.9	V
V_{IH}	Voltage Input High (1.8 V mode)	1.17			V
	Voltage Input High (3.3 V mode)	2.25			
V_{IL}	Voltage Input Low (1.8 V mode)			0.3*VIOIN	V
	Voltage Input Low (3.3 V mode)			0.62	
V_{OH}	High-level output threshold (I_{OH} = 6 mA)	VIOIN – 450			mV
V_{OL}	Low-level output threshold (I_{OL} = 6 mA)			450	mV
NRESET SOP[2:0]	V_{IL} (1.8V Mode)			0.2	V
	V_{IH} (1.8V Mode)	0.96			
	V_{IL} (3.3V Mode)			0.3	
	V_{IH} (3.3V Mode)	1.57

7.5 Power Supply Specifications

表 7-1 describes the four rails from an external power supply block of the IWR1843AOP device.

表 7-1. Power Supply Rails Characteristics

SUPPLY	DEVICE BLOCKS POWERED FROM THE SUPPLY	RELEVANT IOS IN THE DEVICE
1.8 V	Synthesizer and APLL VCOs, crystal oscillator, IF Amplifier stages, ADC, LVDS	Input: VIN_18VCO, VIN18CLK, VIN_18BB, VIOIN_18DIFF, VIOIN_18IO LDO Output: VOUT_14SYNTH, VOUT_14APLL
1.3 V (or 1 V in internal LDO bypass mode)(1)	Power Amplifier, Low Noise Amplifier, Mixers and LO Distribution	Input: VIN_13RF2, VIN_13RF1 LDO Output: VOUT_PA
3.3 V (or 1.8 V for 1.8 V I/O mode)	Digital I/Os	Input VIOIN
1.2 V	Core Digital and SRAMs	Input: VDDIN, VIN_SRAM

(1) Three simultaneous transmitter operation is supported only in 1-V LDO bypass and PA LDO disable mode. In this mode 1V supply needs to be fed on the VOUT PA pin.

The 1.3-V (1.0 V) and 1.8-V power supply ripple specifications mentioned in 表 7-2 are defined to meet a target spur level of –105 dBc (RF Pin = –15 dBm) at the RX. The spur and ripple levels have a dB-to-dB relationship, for example, a 1-dB increase in supply ripple leads to a ~1 dB increase in spur level. Values quoted are rms levels for a sinusoidal input applied at the specified frequency.

表 7-2. Ripple Specifications

FREQUENCY (kHz)	RF RAIL		VCO/IF RAIL
	1.0 V (INTERNAL LDO BYPASS) (μV_{RMS})	1.3 V (μV_{RMS})	1.8 V (μV_{RMS})
137.5	7	648	83
275	5	76	21
550	3	22	11
1100	2	4	6
2200	11	82	13
4400	13	93	19
6600	22	117	29

7.6 Power Consumption Summary

表 7-3 and summarize the power consumption at the power terminals.

表 7-3. Maximum Current Ratings at Power Terminals

PARAMETER	SUPPLY NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
Current consumption	VDDIN, VIN_SRAM, VNWA	Total current drawn by all nodes driven by 1.2V rail			1000	mA
	VIN_13RF1, VIN_13RF2	Total current drawn by all nodes driven by 1.3V or 1.0V rail (2TX, 4 RX simultaneously)(1)			2000	
	VIOIN_18, VIN_18CLK, VIOIN_18DIFF, VIN_18BB, VIN_18VCO	Total current drawn by all nodes driven by 1.8V rail			850	
	VIOIN	Total current drawn by all nodes driven by 3.3V rail			50	

(1) 3 Transmitters can simultaneously be deployed only in IWR1843AOP and IWR2243 devices with 1V / LDO bypass and PA LDO disable mode. In this mode 1V supply needs to be fed on the VOUT PA pin. In this case the peak 1V supply current goes up to 2500 mA.

表 7-4. Average Power Consumption at Power Terminals

PARAMETER	CONDITION			DESCRIPTION	MIN	TYP	MAX	UNIT
Average power consumption	1.0-V internal LDO bypass mode	25% Duty Cycle	1TX, 4RX	Use Case: Regular mode, 6.4 MSps complex transceiver, 25-ms frame time, 128 chirps, 128 samples/chirp, 5-μs idle time (25% duty cycle), 3us ADC start time and excess ramp time, DSP and HWA active		1.29		W
			2TX, 4RX			1.36		
			3TX, 4RX			1.43		
		50% Duty Cycle	1TX, 4RX	Use Case: Regular mode, 6.4 MSps complex transceiver, 25-ms frame time, 256 chirps, 128 samples/chirp, 5-μs idle time (50% duty cycle), 3us ADC start time and excess ramp time, DSP and HWA active		1.82		
			2TX, 4RX			1.96		
			3TX, 4RX			2.08

7.7 RF Specification

over recommended operating conditions (unless otherwise noted)

PARAMETER			MIN	TYP	MAX	UNIT
Receiver	Effective isotropic noise figure[(1)]			10		dB
	IF bandwidth[(2)]				10	MHz
	ADC sampling rate (real)				25	Msps
	ADC sampling rate (complex 1x)				12.5	Msps
	ADC resolution			12		Bits
	Idle Channel Spurs			–90		dBFS
Transmitter	Single transmitter effective isotropic radiated power (EIRP)			16		dBm
Antenna	Receiver antenna 8dB beamwidth			±60		deg
	Transmitter antenna 6dB beamwidth			±60		deg
Clock subsystem	Frequency range		76		81	GHz
	Ramp rate				100	MHz/µs
	Phase noise at 1-MHz offset	76 to 77 GHz		–95		dBc/Hz
		77 to 81 GHz		–93		

(1) Specification is quoted for complex 1x mode.
(2) The analog IF stages include high-pass filtering, with two independently configurable first-order high-pass corner frequencies. The set of available HPF corners is summarized as follows:

Available HPF Corner Frequencies (kHz)	
HPF1	HPF2
175, 235, 350, 700	350, 700, 1400, 2800

The filtering performed by the digital baseband chain is targeted to provide:

- Less than ±0.5 dB pass-band ripple/droop, and
- Better than 60 dB anti-aliasing attenuation for any frequency that can alias back into the pass-band.

7.8 CPU Specifications

over recommended operating conditions (unless otherwise noted)

PARAMETER		MIN	TYP	MAX	UNIT
DSP Subsystem (C674 Family)	Clock Speed		600		MHz
	L1 Code Memory		32		KB
	L1 Data Memory		32		KB
	L2 Memory		256		KB
Main Subsystem (R4F Family)	Clock Speed		200		MHz
	Tightly Coupled Memory - A (Program)		512		KB
	Tightly Coupled Memory - B (Data)		192		KB
Shared Memory	Shared L3 Memory		1024		KB

7.9 Thermal Resistance Characteristics for FCBGA Package [ALP0180A]

THERMAL METRICS[(1)] [(4)]		°C/W[(2)] [(3)]
$R\Theta_{JC}$	Junction-to-case	3.3
$R\Theta_{JB}$	Junction-to-board	10.9
$R\Theta_{JA}$	Junction-to-free air	21.1
$R\Theta_{JMA}$	Junction-to-moving air	N/A[(4)]
Psi_{JT}	Junction-to-package top	1.9
Psi_{JB}	Junction-to-board	10.8

(1) For more information about traditional and new thermal metrics, see *Semiconductor and IC Package Thermal Metrics*.
(2) °C/W = degrees Celsius per watt.
(3) These values are based on a JEDEC-defined 2S2P system (with the exception of the Theta JC [$R\Theta_{JC}$] value, which is based on a JEDEC-defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/ JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

A junction temperature of 125°C is assumed.
(4) N/A = not applicable

7.10 Timing and Switching Characteristics

7.10.1 Antenna Radiation Patterns

This section discusses transmitter and receiver antenna radiation patterns in both Azmiuth and Elevation planes for a specified frequency.

Copyright © 2023 Texas Instruments Incorporated

7.10.1.1 Antenna Radiation Patterns for Receiver

図 7-1 shows the RX effective Isotropic noise figure across the entire frequency band.

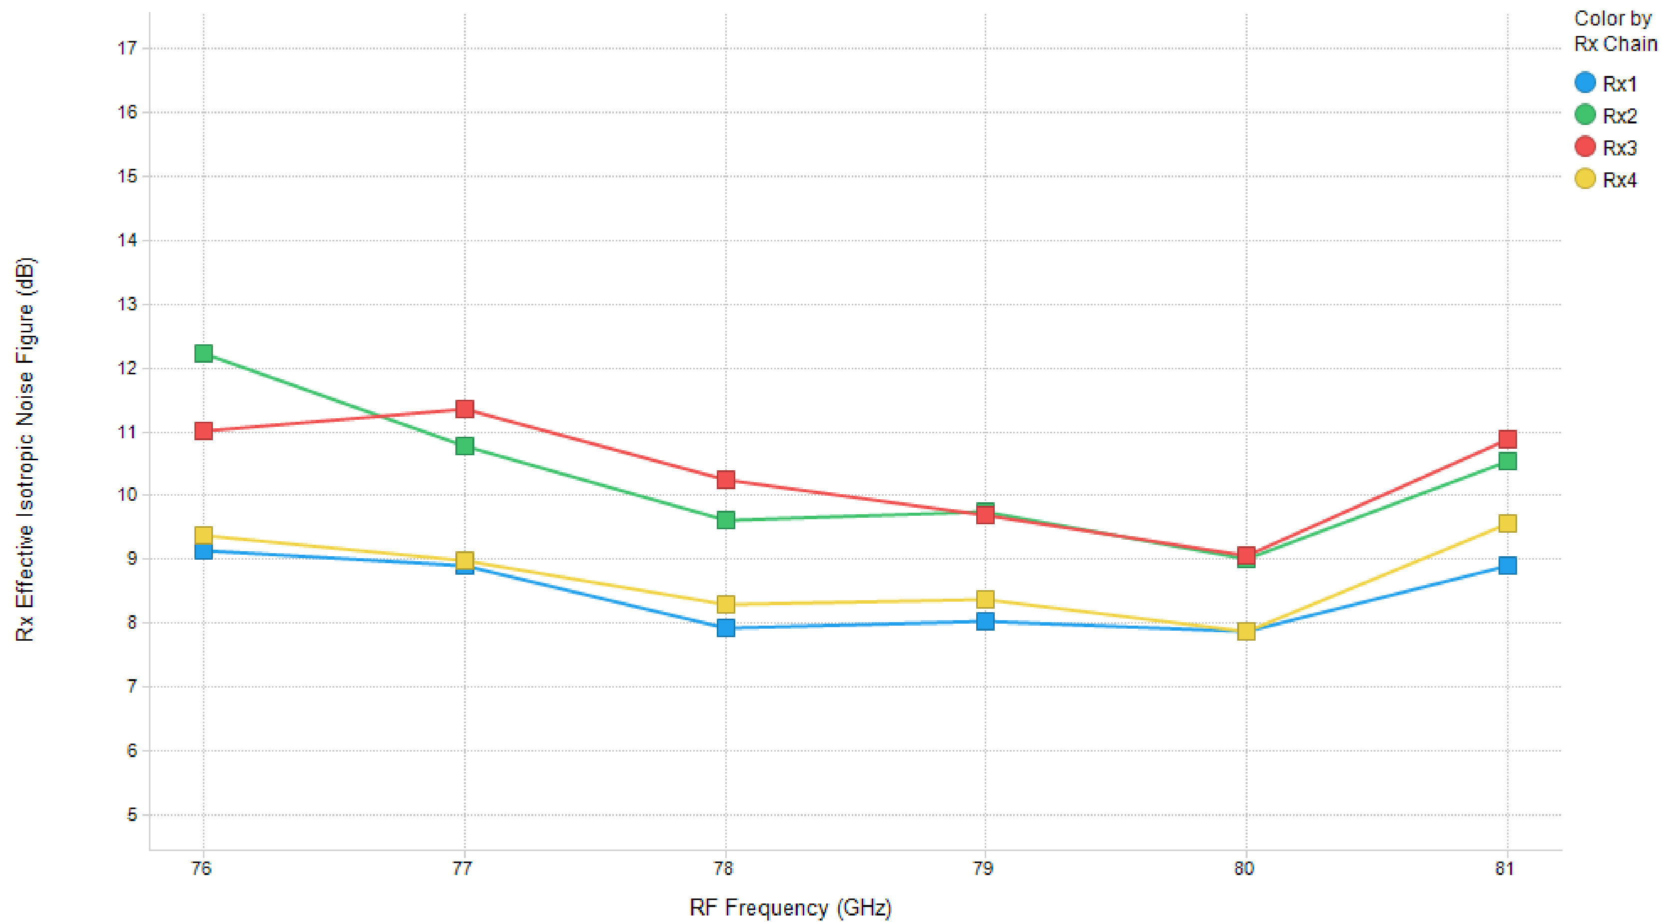

図 7-1. RX Effective Isotropic Noise Figure

図 7-2 and 図 7-3 shows typical antenna radiation patterns for the four receivers in both Azimuth and Elevation planes.

Copyright © 2023 Texas Instruments Incorporated

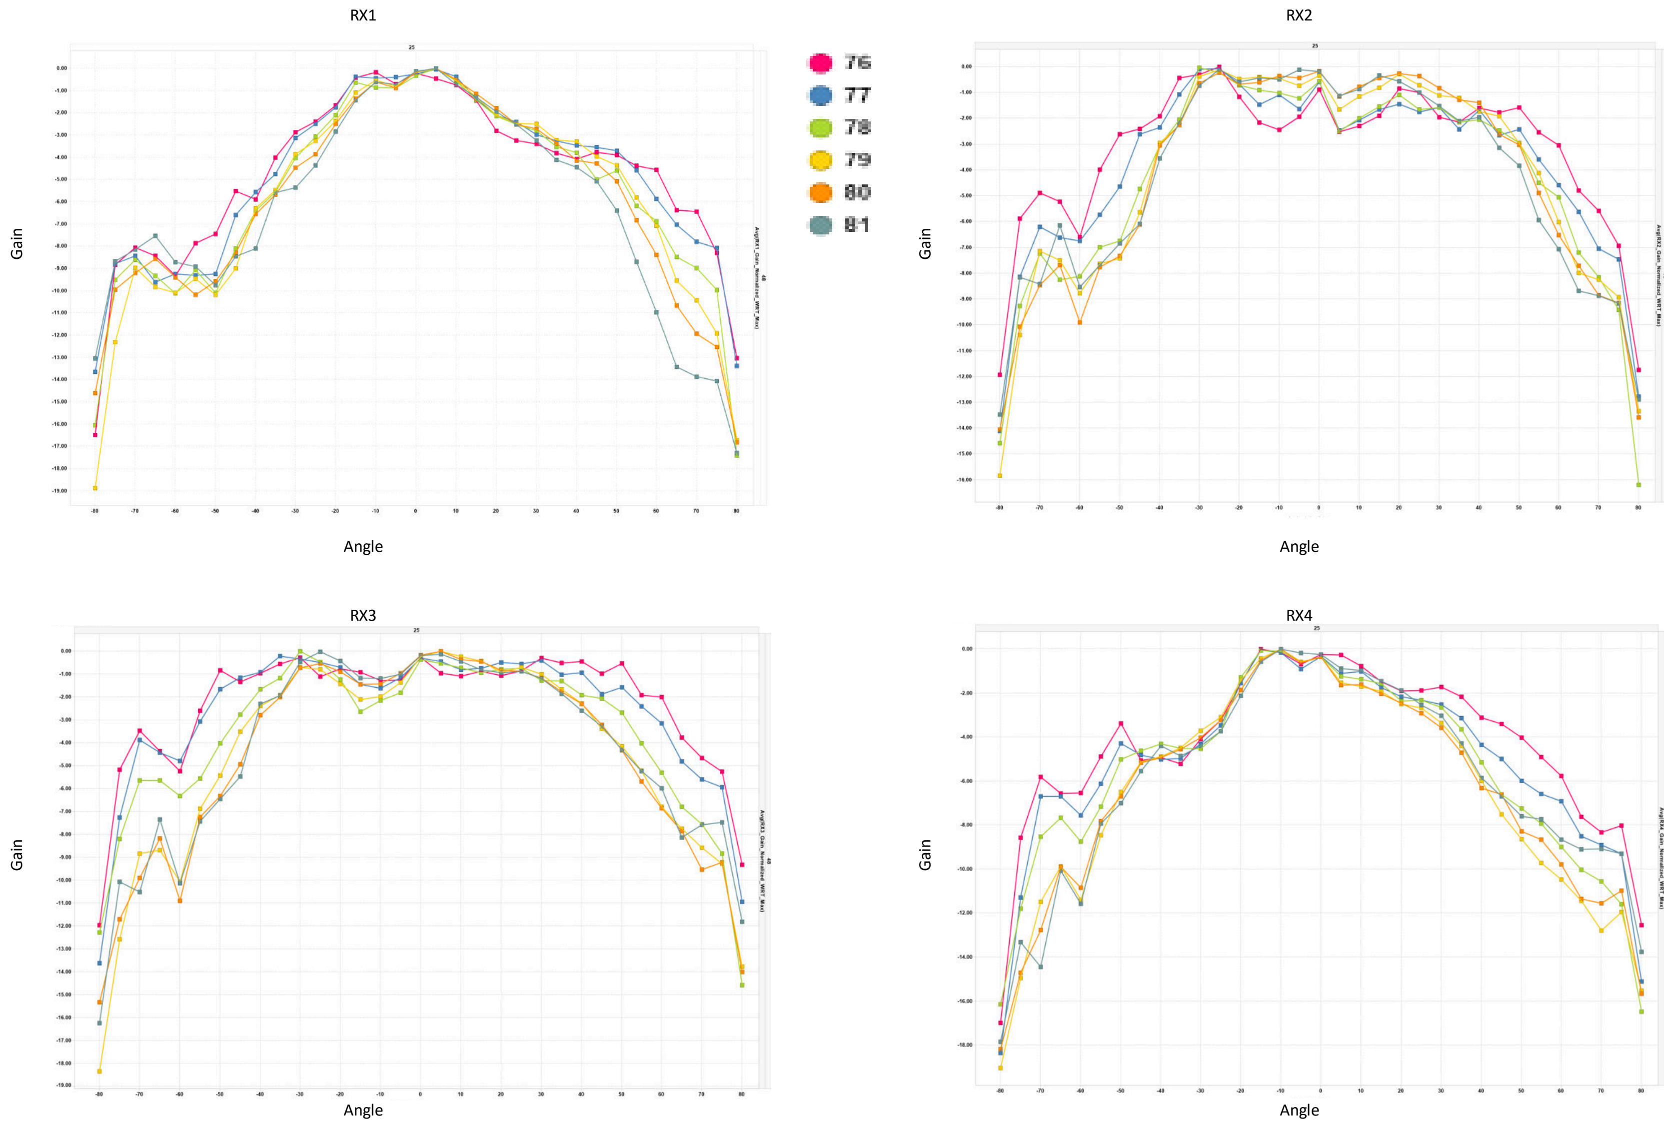

図 7-2. Receiver Antenna Radiation Pattern - Azimuth

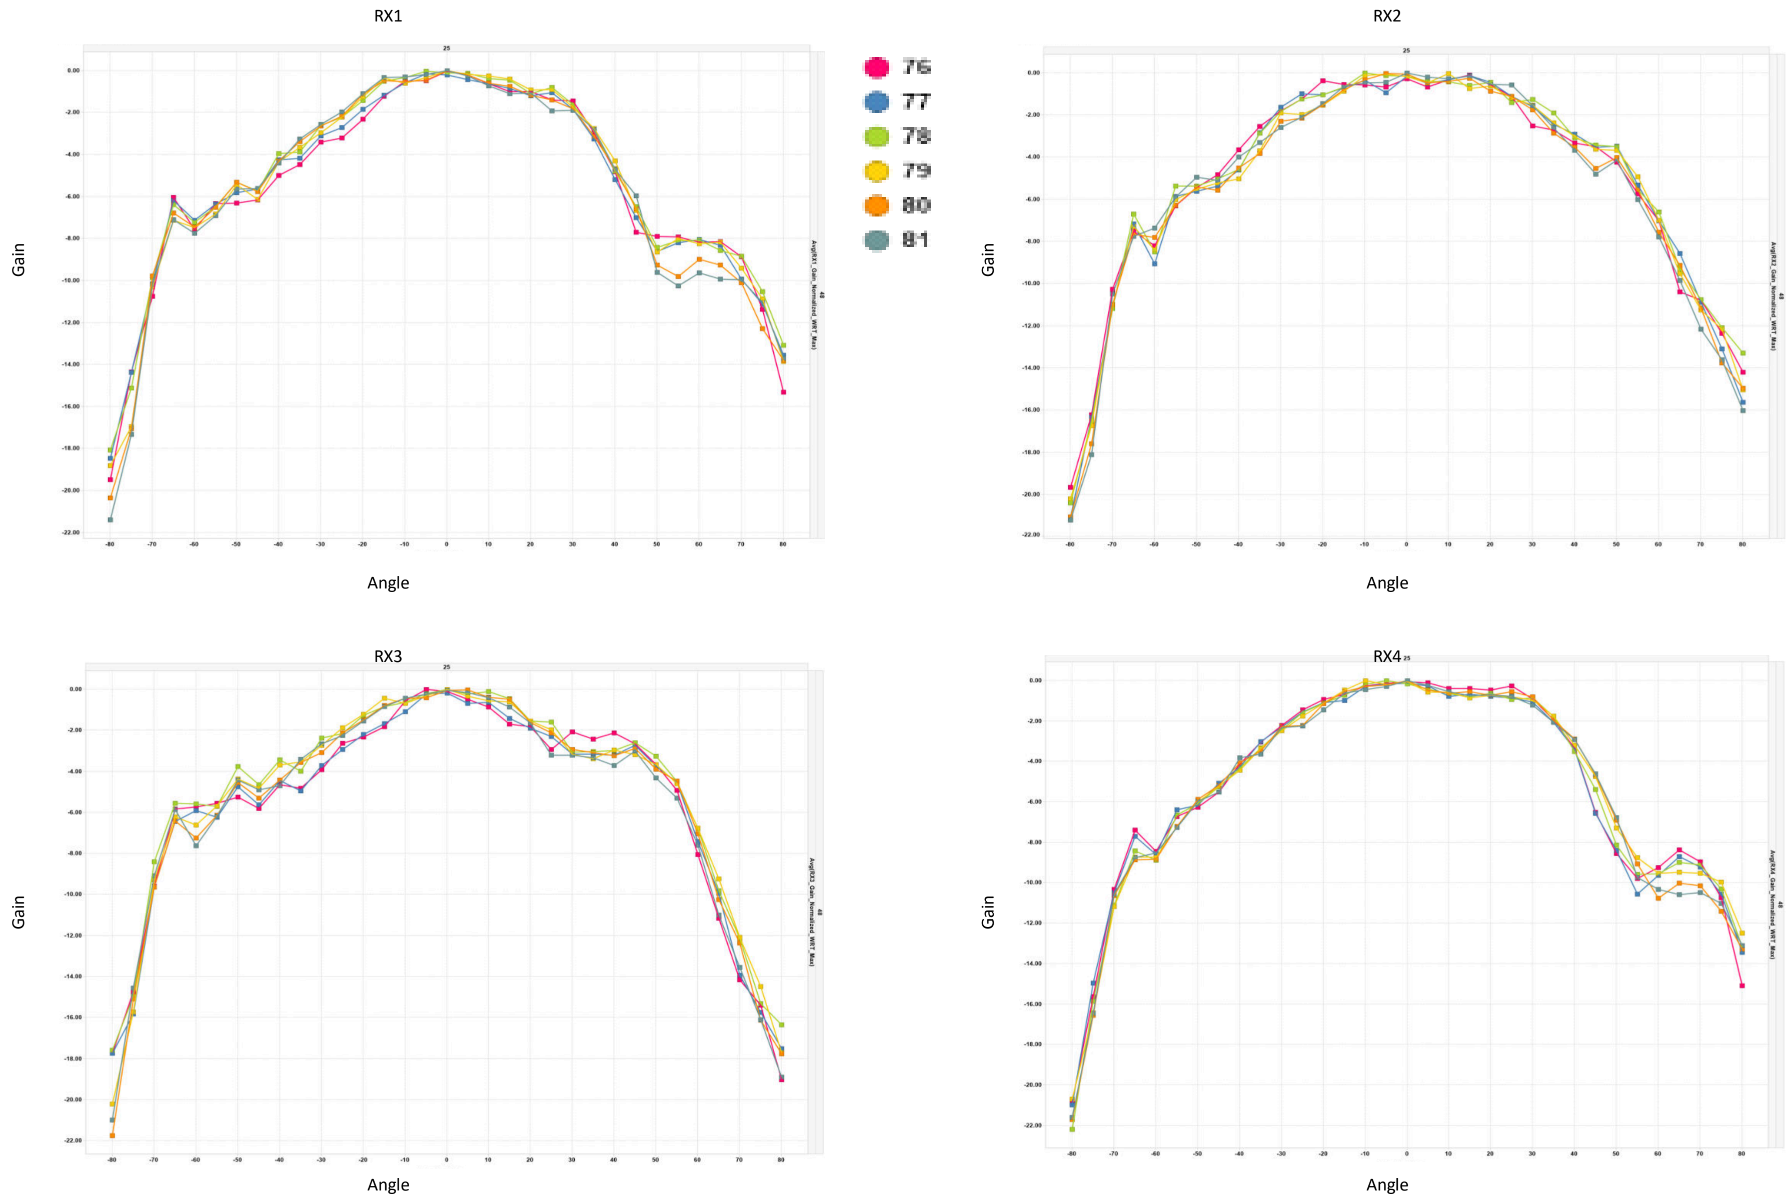

図 7-3. Receiver Antenna Radiation Pattern - Elevation

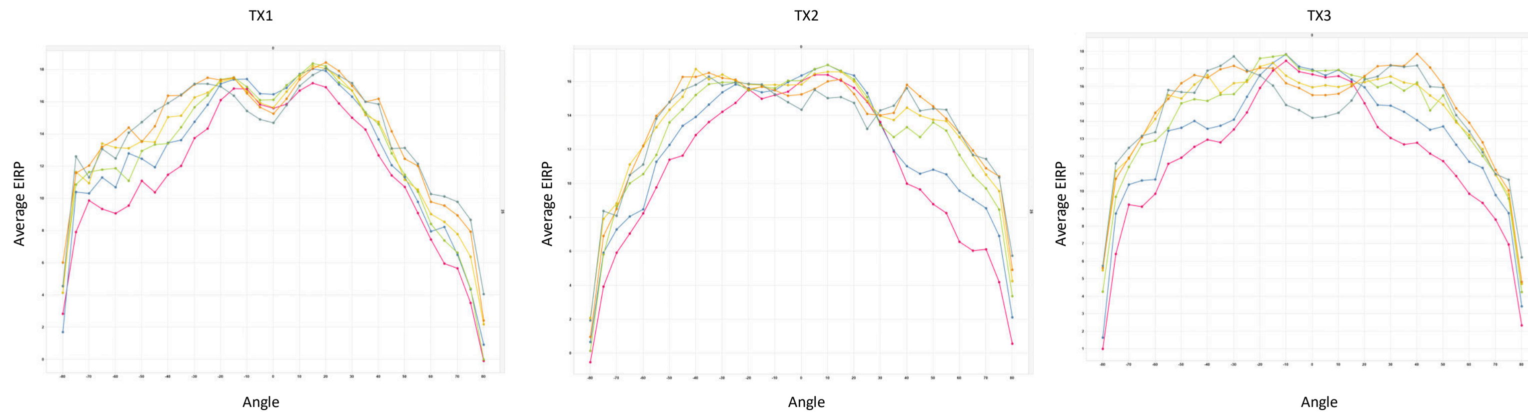
7.10.1.2 Antenna Radiation Patterns for Transmitter

図 7-4 shows typical antenna radiation patterns for the three transmitters in both Azimuth and Elevation planes.

TX Output Power Across Azimuth



TX Output Power Across Elevation

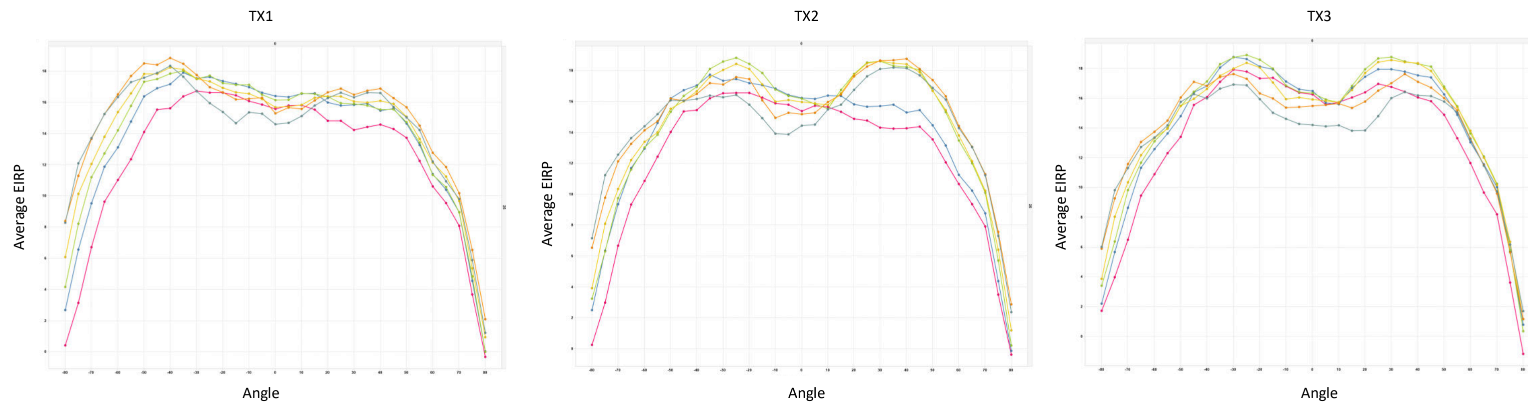


図 7-4. Transmitter Antenna Radiation Pattern

7.10.2 Antenna Positions

図 7-5 shows the placement and relative spacing of the antennas. Lambda corresponds to a frequency of 78.5 GHz.

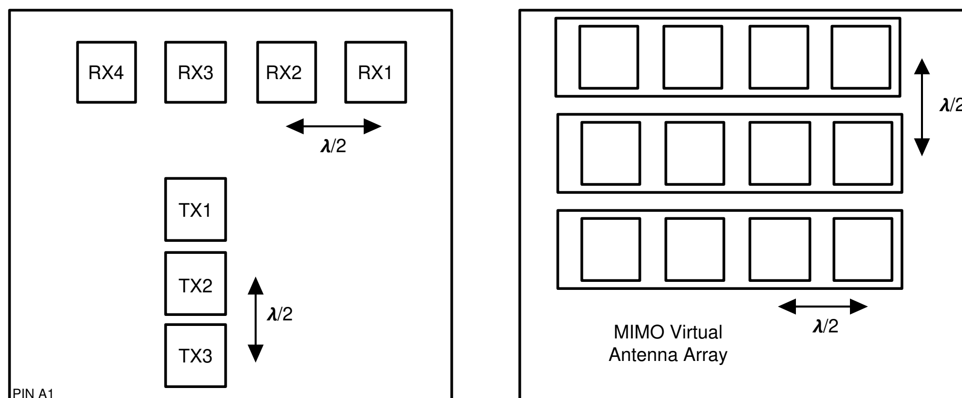

図 7-5. Antenna Positions (Placement and Relative Spacing)

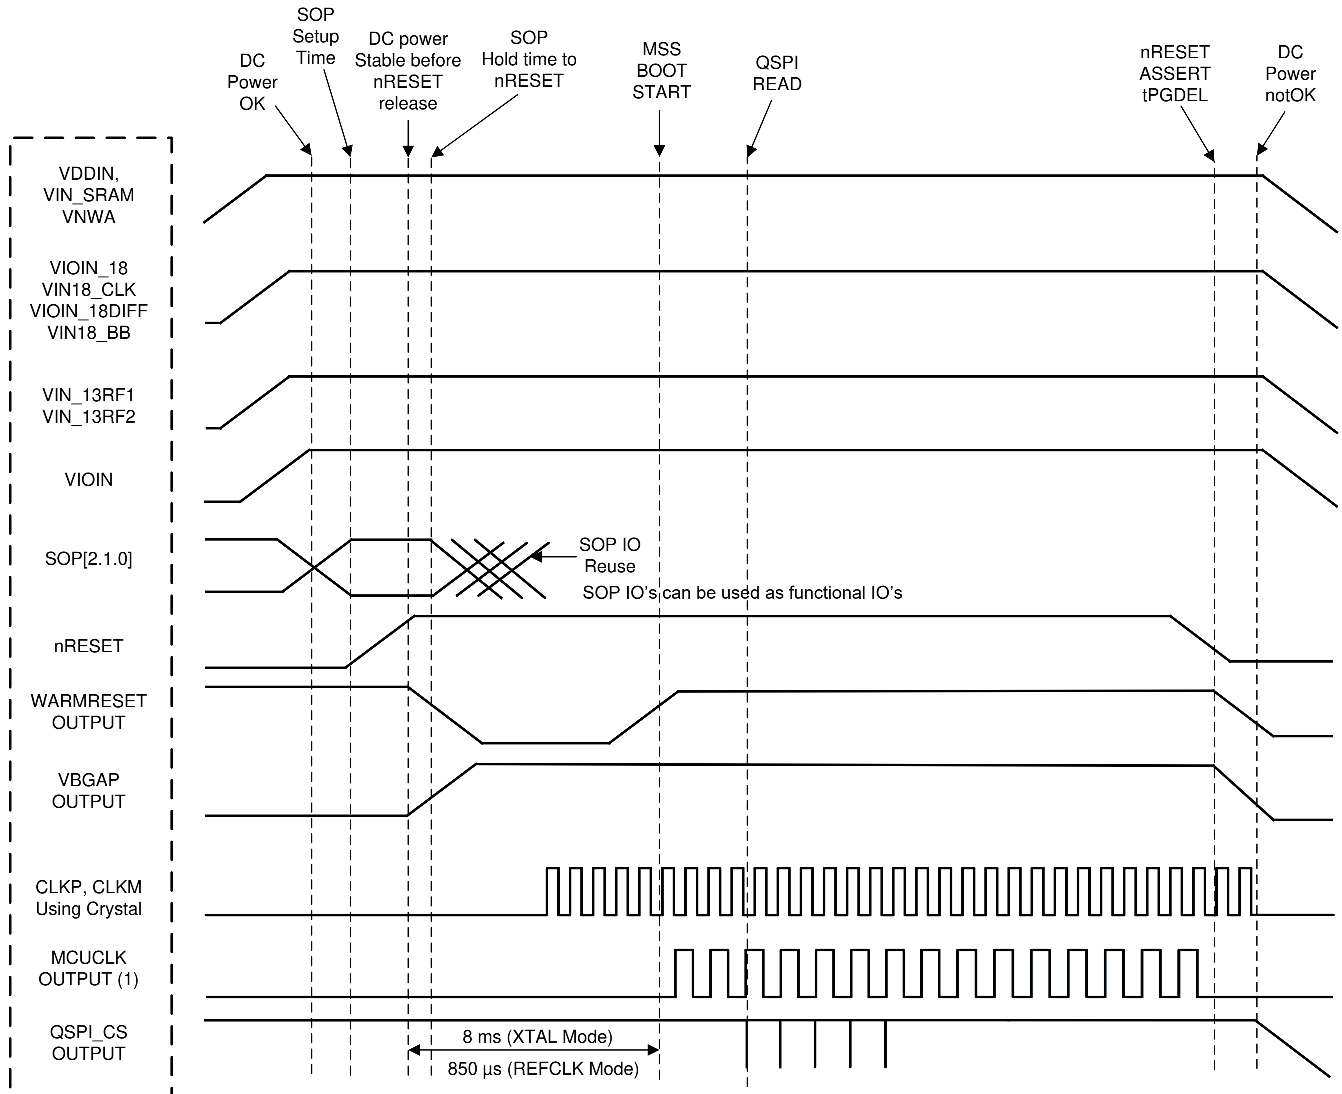
7.10.3 Power Supply Sequencing and Reset Timing

The IWR1843AOP device expects all external voltage rails and SOP lines to be stable before reset is deasserted. 図 7-6 describes the device wake-up sequence.

Copyright © 2023 Texas Instruments Incorporated



A. MCU_CLK_OUT in autonomous mode, where IWR1843AOP application is booted from the serial flash, MCU_CLK_OUT is not enabled by default by the device bootloader.

図 7-6. Device Wake-up Sequence

7.10.4 Input Clocks and Oscillators

7.10.4.1 Clock Specifications

The IWR1843AOP requires external clock source (that is, a 40-MHz crystal or external clock) for initial boot and as a reference for an internal APLL hosted in the device. An external crystal is connected to the device pins. 図 7-7 shows the crystal implementation.

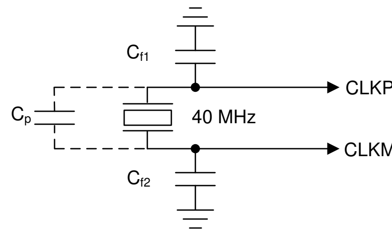


図 7-7. Crystal Implementation

注

The load capacitors, C_{f1} and C_{f2} in 図 7-7, should be chosen such that 式 1 is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator CLKP and CLKM pins.

$$C_L = C_{f1} \times \frac{C_{f2}}{C_{f1} + C_{f2}} + C_P \quad (1)$$

表 7-5 lists the electrical characteristics of the clock crystal.

表 7-5. Crystal Electrical Characteristics (Oscillator Mode)

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f_P	Parallel resonance crystal frequency		40		MHz
C_L	Crystal load capacitance	5	8	12	pF
ESR	Crystal ESR			50	Ω
Temperature range	Expected temperature range of operation	–40		140	°C
Frequency tolerance	Crystal frequency tolerance(1) (2)	–200		200	ppm
Drive level			50	200	µW

(1) The crystal manufacturer's specification must satisfy this requirement.
(2) Includes initial tolerance of the crystal, drift over temperature, aging and frequency pulling due to incorrect load capacitance.

7.10.5 Multibuffered / Standard Serial Peripheral Interface (MibSPI)

7.10.5.1 Peripheral Description

The MibSPI/SPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted into and out of the device at a programmed bit-transfer rate. The MibSPI/SPI is normally used for communication between the microcontroller and external peripherals or another microcontroller.

Standard SPI and MibSPI modules have the following features:

- 16-bit shift register
- Receive buffer register
- 8-bit baud clock generator
- SPICLK can be internally-generated (controller mode) or received from an external clock source (peripheral mode)
- Each word transferred can have a unique format.
- SPI I/Os not used in the communication can be used as digital input/output signals

7.10.5.2 MibSPI Transmit and Receive RAM Organization

The Multibuffer RAM is comprised of 256 buffers. Each entry in the Multibuffer RAM consists of 4 parts: a 16-bit transmit field, a 16-bit receive field, a 16-bit control field and a 16-bit status field. The Multibuffer RAM can be partitioned into multiple transfer group with variable number of buffers each.

セクション 7.10.5.2.2 assumes the operating conditions stated in セクション 7.10.5.2.1.

7.10.5.2.1 SPI Timing Conditions

		MIN	TYP	MAX	UNIT
Input Conditions					
t_R	Input rise time	1		3	ns
t_F	Input fall time	1		3	ns
Output Conditions					
C_{LOAD}	Output load capacitance	2		15	pF

8[(4)]	$t_{su(SOMI-SPCL)M}$	Setup time, SPISOMI before SPICLK low (clock polarity = 0)		5			ns
	$t_{su(SOMI-SPCH)M}$	Setup time, SPISOMI before SPICLK high (clock polarity = 1)		5			
9[(4)]	$t_{h(SPCL-SOMI)M}$	Hold time, SPISOMI data valid after SPICLK low (clock polarity = 0)		3			ns
	$t_{h(SPCH-SOMI)M}$	Hold time, SPISOMI data valid after SPICLK high (clock polarity = 1)		3			

(1) The Controller bit (SPIGCRx.0) is set and the CLOCK PHASE bit (SPIFMTx.16) is cleared (where x= 0 or 1).
(2) $t_{c(MSS_VCLK)}$ = main subsystem clock time = 1 / $f_{(MSS_VCLK)}$. For more details, see the Technical Reference Manual.
(3) When the SPI is in controller mode, the following must be true: For PS values from 1 to 255: $t_{c(SPC)M} \geq (PS +1)t_{c(MSS_VCLK)} \geq 25ns$, where PS is the prescale value set in the SPIFMTx.[15:8] register bits. For PS values of 0: $t_{c(SPC)M} = 2t_{c(MSS_VCLK)} \geq 25ns$.

(4) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPIFMTx.17).
(5) C2TDELAY and T2CDELAY is programmed in the SPIDELAY register

7.10.6 LVDS Interface Configuration

The supported IWR1843AOP LVDS lane configuration is two Data lanes (LVDS_TXP/M), one Bit Clock lane (LVDS_CLKP/M) and one Frame clock lane (LVDS_FRCLKP/M). The LVDS interface is used for debugging. The LVDS interface supports the following data rates:

- 900 Mbps (450 MHz DDR Clock)
- 600 Mbps (300 MHz DDR Clock)
- 450 Mbps (225 MHz DDR Clock)
- 400 Mbps (200 MHz DDR Clock)
- 300 Mbps (150 MHz DDR Clock)
- 225 Mbps (112.5 MHz DDR Clock)
- 150 Mbps (75 MHz DDR Clock)

Note that the bit clock is in DDR format and hence the numbers of toggles in the clock is equivalent to data.

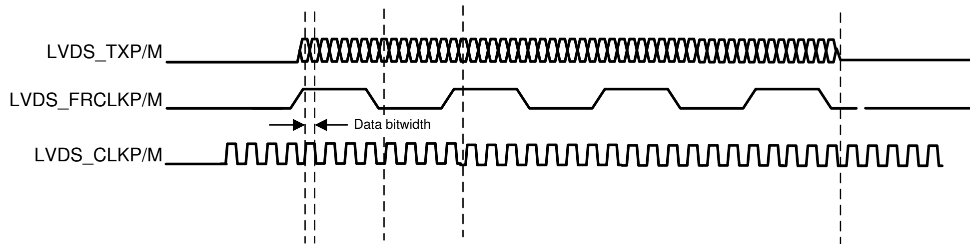

図 7-15. LVDS Interface Lane Configuration And Relative Timings

7.10.6.1 LVDS Interface Timings

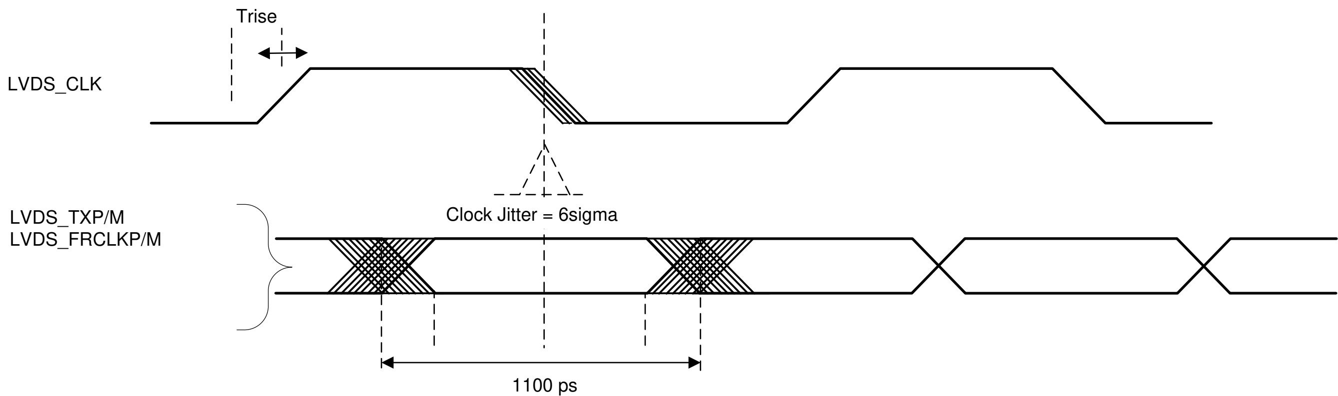

図 7-16. Timing Parameters

表 7-7. LVDS Electrical Characteristics

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Duty Cycle Requirements	max 1 pF lumped capacitive load on LVDS lanes	48%		52%	
Output Differential Voltage	peak-to-peak single-ended with 100 Ω resistive load between differential pairs	250		450	mV
Output Offset Voltage		1125		1275	mV
Trise and Tfall	20%-80%, 900 Mbps		330		ps
Jitter (pk-pk)	900 Mbps		80		ps

7.10.7 General-Purpose Input/Output

セクション 7.10.7.1 lists the switching characteristics of output timing relative to load capacitance.

7.10.7.1 Switching Characteristics for Output Timing versus Load Capacitance (C_L)(1) (2)

PARAMETER		TEST CONDITIONS		VIOIN = 1.8V	VIOIN = 3.3V	UNIT
t_r	Max rise time	Slew control = 0	C_L = 20 pF	2.8	3.0	ns
			C_L = 50 pF	6.4	6.9	
			C_L = 75 pF	9.4	10.2	
t_f	Max fall time		C_L = 20 pF	2.8	2.8	ns
			C_L = 50 pF	6.4	6.6	
			C_L = 75 pF	9.4	9.8	
t_r	Max rise time	Slew control = 1	C_L = 20 pF	3.3	3.3	ns
			C_L = 50 pF	6.7	7.2	
			C_L = 75 pF	9.6	10.5	
t_f	Max fall time		C_L = 20 pF	3.1	3.1	ns
			C_L = 50 pF	6.6	6.6	
			C_L = 75 pF	9.6	9.6	

(1) Slew control, which is configured by PADxx_CFG_REG, changes behavior of the output driver (faster or slower output slew rate).
(2) The rise/fall time is measured as the time taken by the signal to transition from 10% and 90% of VIOIN voltage.

Copyright © 2023 Texas Instruments Incorporated

7.10.8 Controller Area Network Interface (DCAN)

The DCAN supports the CAN 2.0B protocol standard and uses a serial, multicontroller communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 Mbps. The DCAN is ideal for applications operating in noisy and harsh environments that require reliable serial communication or multiplexed wiring.

The DCAN has the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 Mbps
- Configurable Message objects
- Individual identifier masks for each message object
- Programmable FIFO mode for message objects
- Suspend mode for debug support
- Programmable loop-back modes for self-test operation
- Direct access to Message RAM in test mode
- Supports two interrupt lines - Level 0 and Level 1
- Automatic Message RAM initialization

7.10.8.1 Dynamic Characteristics for the DCANx TX and RX Pins

PARAMETER		MIN	TYP	MAX	UNIT
$t_{d(CAN_tx)}$	Delay time, transmit shift register to CAN_tx pin[1]			15	ns
$t_{d(CAN_rx)}$	Delay time, CAN_rx pin to receive shift register[1]			10	ns

(1) These values do not include rise/fall times of the output buffer.

Copyright © 2023 Texas Instruments Incorporated

7.10.9 Controller Area Network - Flexible Data-rate (CAN-FD)

The CAN-FD module supports both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

The CAN-FD has the following features:

- Conforms with CAN Protocol 2.0 A, B and ISO 11898-1
- Full CAN FD support (up to 64 data bytes per frame)
- AUTOSAR and SAE J1939 support
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO, up to 32 elements
- Configurable Transmit Queue, up to 32 elements
- Configurable Transmit Event FIFO, up to 32 elements
- Up to 64 dedicated Receive Buffers
- Two configurable Receive FIFOs, up to 64 elements each
- Up to 128 11-bit filter elements
- Internal Loopback mode for self-test
- Mask-able interrupts, two interrupt lines
- Two clock domains (CAN clock / Host clock)
- Parity / ECC support - Message RAM single error correction and double error detection (SECDED) mechanism
- Full Message Memory capacity (4352 words).

7.10.9.1 Dynamic Characteristics for the CANx TX and RX Pins

PARAMETER		MIN	TYP	MAX	UNIT
$t_{d(CAN_FD_tx)}$	Delay time, transmit shift register to CAN_FD_tx pin[(1)]			15	ns
$t_{d(CAN_FD_rx)}$	Delay time, CAN_FD_rx pin to receive shift register[(1)]			10	ns

(1) These values do not include rise/fall times of the output buffer.

7.10.10 Serial Communication Interface (SCI)

The SCI has the following features:

- Standard universal asynchronous receiver-transmitter (UART) communication
- Standard non-return to zero (NRZ) format
- Double-buffered receive and transmit functions
- Asynchronous or iso-synchronous communication modes with no CLK pin
- Capability to use Direct Memory Access (DMA) for transmit and receive data
- Two external pins: RS232_RX and RS232_TX

7.10.10.1 SCI Timing Requirements

		MIN	TYP	MAX	UNIT
f(baud)	Supported baud rate at 20 pF		921.6		kHz

7.10.11 Inter-Integrated Circuit Interface (I2C)

The inter-integrated circuit (I2C) module is a multicontroller communication module providing an interface between devices compliant with Philips Semiconductor I2C-bus specification version 2.1 and connected by an I^2C-bus™. This module will support any peripheral or controller I2C compatible device.

The I2C has the following features:

- Compliance to the Philips I2C bus specification, v2.1 (The I2C Specification, Philips document number 9398 393 40011)
  - Bit/Byte format transfer
  - 7-bit and 10-bit device addressing modes
  - General call
  - START byte
  - Multi-controller transmitter/ peripheral receiver mode
  - Multi-controller receiver/ peripheral transmitter mode
  - Combined controller transmit/receive and receive/transmit mode
  - Transfer rates of 100 kbps up to 400 kbps (Phillips fast-mode rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

注

This I2C module does not support:

- High-speed (HS) mode
- C-bus compatibility mode
- The combined format in 10-bit address mode (the I2C sends the peripheral address second byte every time it sends the peripheral address first byte)

Copyright © 2023 Texas Instruments Incorporated

7.10.11.1 I2C Timing Requirements[1]

		STANDARD MODE		FAST MODE		UNIT
		MIN	MAX	MIN	MAX	
$t_{c(SCL)}$	Cycle time, SCL	10		2.5		µs
$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		µs
$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		µs
$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		µs
$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		µs
$t_{su(SDA-SCLH)}$	Setup time, SDA valid before SCL high	250		100		µs
$t_{h(SCLL-SDA)}$	Hold time, SDA valid after SCL low	0	3.45[1]	0	0.9	µs
$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		µs
$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		µs
$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
C_b [2] [3]	Capacitive load for each bus line		400		400	pF

(1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
(2) The maximum th(SDA-SCLL) for I2C bus devices has only to be met if the device does not stretch the low period (tw(SCLL)) of the SCL signal.
(3) C_b = total capacitance of one bus line in pF. If mixed with fast-mode devices, faster fall-times are allowed.

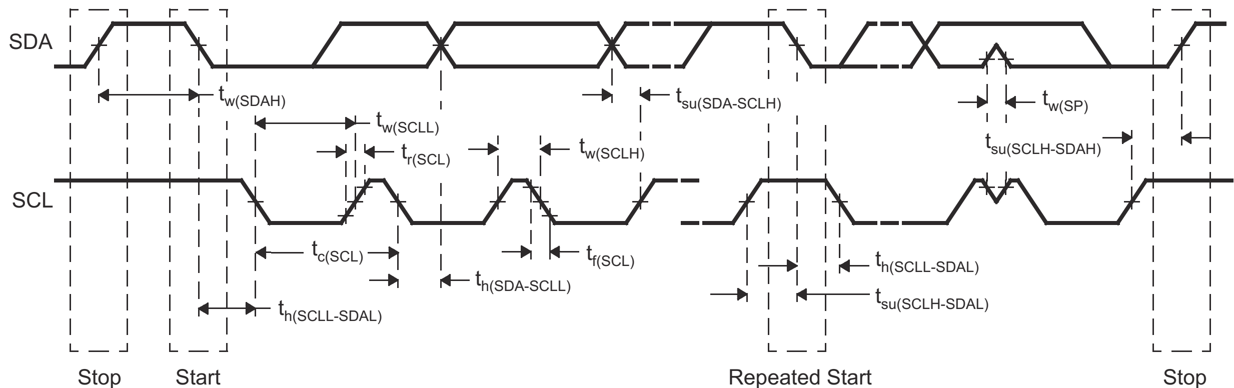

図 7-17. I2C Timing Diagram

注

- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- The maximum th(SDA-SCLL) has only to be met if the device does not stretch the LOW period (tw(SCLL)) of the SCL signal. E.A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line tr max + $t_{su(SDA-SCLH)}$.

7.10.12 Quad Serial Peripheral Interface (QSPI)

The quad serial peripheral interface (QSPI™) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a controller only. The QSPI in the device is primarily intended for fast booting from quad-SPI flash memories.

The QSPI supports the following features:

- Programmable clock divider
- Six-pin interface
- Programmable length (from 1 to 128 bits) of the words transferred
- Programmable number (from 1 to 4096) of the words transferred
- Support for 3-, 4-, or 6-pin SPI interface
- Optional interrupt generation on word or frame (number of words) completion
- Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles

セクション 7.10.12.2 and セクション 7.10.12.3 assume the operating conditions stated in セクション 7.10.12.1.

7.10.12.1 QSPI Timing Conditions

		MIN	TYP	MAX	UNIT
Input Conditions					
t_R	Input rise time	1		3	ns
t_F	Input fall time	1		3	ns
Output Conditions					
C_{LOAD}	Output load capacitance	2		15	pF

7.10.12.2 Timing Requirements for QSPI Input (Read) Timings[(1)] [(2)]

		MIN	TYP	MAX	UNIT
$t_{su(D\text{-}SCLK)}$	Setup time, d[3:0] valid before falling sclk edge (Q12)	7.3			ns
$t_{h(SCLK\text{-}D)}$	Hold time, d[3:0] valid after falling sclk edge (Q13)	1.5			ns
$t_{su(D\text{-}SCLK)}$	Setup time, final d[3:0] bit valid before final falling sclk edge	7.3 – P[(3)]			ns
$t_{h(SCLK\text{-}D)}$	Hold time, final d[3:0] bit valid after final falling sclk edge	1.5 + P[(3)]			ns

(1) Clock Mode 0 (clk polarity = 0 ; clk phase = 0) is the mode of operation.
(2) The Device captures data on the falling clock edge in Clock Mode 0, as opposed to the traditional rising clock edge. Although non-standard, the falling-edge-based setup and hold time timings have been designed to be compatible with standard SPI devices that launch data on the falling edge in Clock Mode 0.
(3) P = SCLK period in ns.

Copyright © 2023 Texas Instruments Incorporated

7.10.12.3 QSPI Switching Characteristics

NO.	PARAMETER[(1) (2) (3)]		MIN	TYP	MAX	UNIT
Q1	$t_{c(SCLK)}$	Cycle time, sclk	25			ns
Q2	$t_{w(SCLKL)}$	Pulse duration, sclk low	0.5*P – 3			ns
Q3	$t_{w(SCLKH)}$	Pulse duration, sclk high	0.5*P – 3			ns
Q4	$t_{d(CS-SCLK)}$	Delay time, sclk falling edge to cs active edge	–M*P – 1		–M*P + 2.5	ns
Q5	$t_{d(SCLK-CS)}$	Delay time, sclk falling edge to cs inactive edge	N*P – 1		N*P + 2.5	ns
Q6	$t_{d(SCLK-D1)}$	Delay time, sclk falling edge to d[0] transition	–3.5		7	ns
Q7	$t_{ena(CS-D1LZ)}$	Enable time, cs active edge to d[0] driven (lo-z)	–P – 4		–P +1	ns
Q8	$t_{dis(CS-D1Z)}$	Disable time, cs active edge to d[0] tri-stated (hi-z)	–P – 4		–P +1	ns
Q9	$t_{d(SCLK-D1)}$	Delay time, sclk first falling edge to first d[1] transition (for PHA = 0 only)	–3.5 – P		7 – P	ns

(1) The Y parameter is defined as follows: If DCLK_DIV is 0 or ODD then, Y equals 0.5. If DCLK_DIV is EVEN then, Y equals (DCLK_DIV/2) / (DCLK_DIV+1). For best performance, it is recommended to use a DCLK_DIV of 0 or ODD to minimize the duty cycle distortion. The HSDIVIDER on CLKOUTX2_H13 output of DPLL_PER can be used to achieve the desired clock divider ratio. All required details about clock division factor DCLK_DIV can be found in the device-specific Technical Reference Manual.
(2) P = SCLK period in ns.
(3) M = QSPI_SPI_DC_REG.DDx + 1, N = 2

7.10.14 Data Modification Module (DMM)

A Data Modification Module (DMM) gives the ability to write external data into the device memory.

The DMM has the following features:

- Acts as a bus controller, thus enabling direct writes to the 4GB address space without CPU intervention
- Writes to memory locations specified in the received packet (leverages packets defined by trace mode of the RAM trace port [RTP] module)
- Writes received data to consecutive addresses, which are specified by the DMM (leverages packets defined by direct data mode of RTP module)
- Configurable port width (1, 2, 4, 8, 16 pins)
- Up to 65 Mbit/s pin data rate

7.10.14.1 DMM Timing Requirements

		MIN	TYP	MAX	UNIT
$t_{cyc(DMM)}$	Clock period	15.4			ns
t_R	Clock rise time	1		3	ns

8 Detailed Description

8.1 Overview

The IWR1843AOP device includes the entire Millimeter Wave blocks and analog baseband signal chain for three transmitters and four receivers, as well as a customer-programmable MCU, Radar Hardware accelerator, and a DSP. This device is applicable as a radar-on-a-chip in use-cases with modest requirements for memory, processing capacity, and application code size. These could be cost-sensitive industrial radar-sensing applications. Examples are:

- Industrial-level sensing
- Industrial automation sensor fusion with radar
- Traffic intersection monitoring with radar
- Industrial radar-proximity monitoring
- People counting
- Gesturing

8.3 Subsystems

8.3.1 RF and Analog Subsystem

The RF and analog subsystem includes the RF and analog circuitry – namely, the synthesizer, PA, LNA, mixer, IF, and ADC. This subsystem also includes the crystal oscillator and temperature sensors. The three transmit channels can be operated up to a maximum of two at a time (simultaneously) for transmit beamforming purpose as required; whereas the four receive channels can all be operated simultaneously.

Copyright © 2023 Texas Instruments Incorporated

8.3.1.1 Clock Subsystem

The IWR1843AOP clock subsystem generates 76 to 81 GHz from an input reference of 40-MHz crystal. It has a built-in oscillator circuit followed by a clean-up PLL and a RF synthesizer circuit. The output of the RF synthesizer is then processed by an X4 multiplier to create the required frequency in the 76 to 81 GHz spectrum. The RF synthesizer output is modulated by the timing engine block to create the required waveforms for effective sensor operation.

The clean-up PLL also provides a reference clock for the host processor after system wakeup.

The clock subsystem also has built-in mechanisms for detecting the presence of a crystal and monitoring the quality of the generated clock.

図 8-1 describes the clock subsystem.

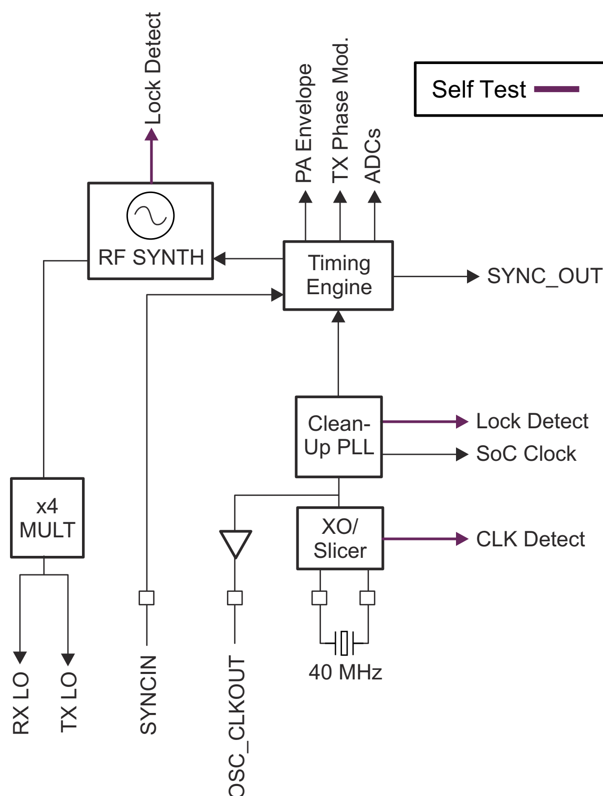

図 8-1. Clock Subsystem

Copyright © 2023 Texas Instruments Incorporated

8.3.1.2 Transmit Subsystem

The IWR1843AOP transmit subsystem consists of three parallel transmit chains, each with independent phase and amplitude control. All three transmitters can be used simultaneously. For IWR1843AOP, additional phase shifters are associated with Tx channels, and these can programmed on a per chirp basis.

Each transmit chain can deliver a maximum of 16 dBm EIRP. The transmit chains also support programmable backoff for system optimization.

図 8-2 describes the transmit subsystem.

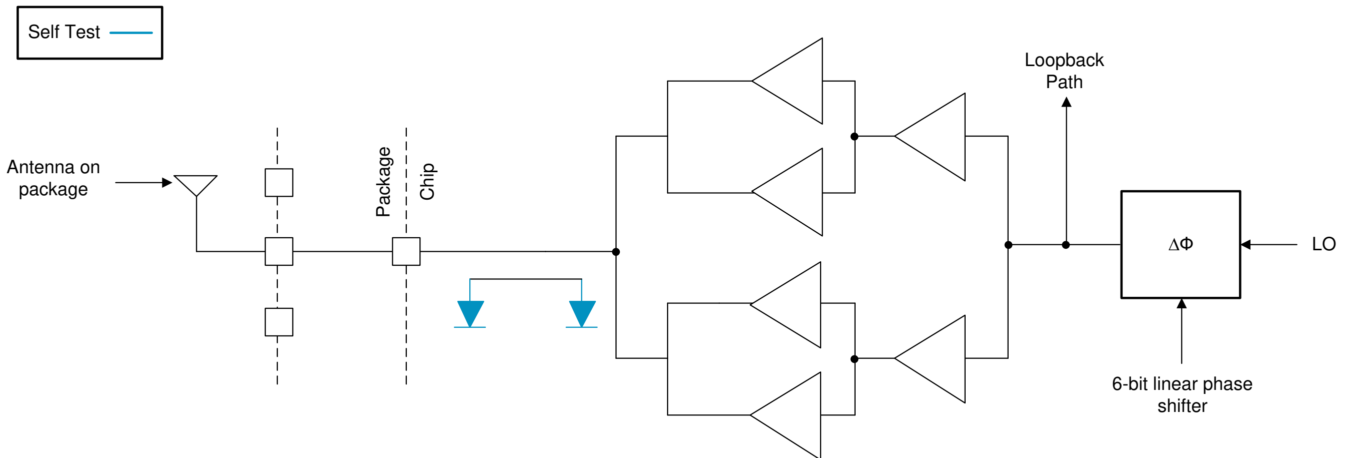

図 8-2. Transmit Subsystem (Per Channel)

8.3.1.3 Receive Subsystem

The IWR1843AOP receive subsystem consists of four parallel channels. A single receive channel consists of an LNA, mixer, IF filtering, ADC conversion, and decimation. All four receive channels can be operational at the same time an individual power-down option is also available for system optimization.

Unlike conventional real-only receivers, the IWR1843AOP device supports a complex baseband architecture, which uses quadrature mixer and dual IF and ADC chains to provide complex I and Q outputs for each receiver channel. The IWR1843AOP is targeted for fast chirp systems. The band-pass IF chain has configurable lower cutoff frequencies above 175 kHz and can support bandwidths up to 10 MHz.

図 8-3 describes the receive subsystem.

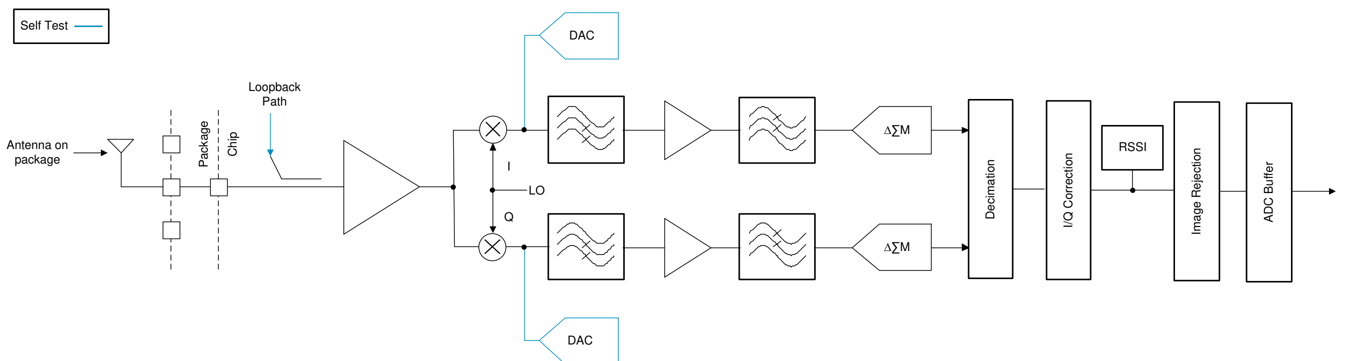

図 8-3. Receive Subsystem (Per Channel)

8.3.2 Processor Subsystem

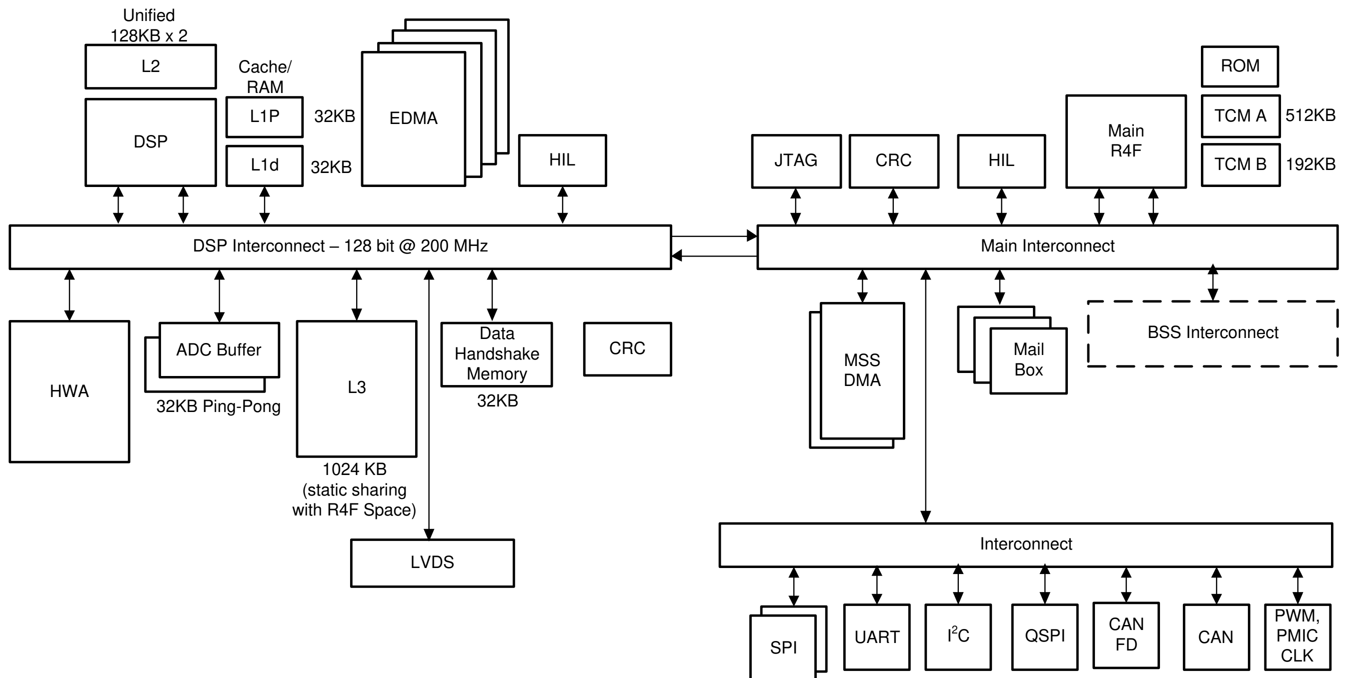

図 8-4. Processor Subsystem

図 8-4 shows the block diagram for customer programmable processor subsystems in the IWR1843AOP device. At a high level there are two customer programmable subsystems. Left hand side shows the DSP Subsystem which contains TI's high-performance C674x DSP, a high-bandwidth interconnect for high performance (128-bit, 200MHz) and associated peripherals – four DMAs for data transfer,

LVDS interface for Measurement data output, L3 Radar data cube memory, ADC buffers, CRC engine, and data handshake memory (additional memory provided on interconnect).

The right side of the diagram shows the Main subsystem. Main subsystem as name suggests is the main device and controls all the device peripherals and house-keeping activities of the device. Main subsystem contains Cortex-R4F (MSS R4F) processor and associated peripherals and house-keeping components such as DMAs, CRC and Peripherals (I^2C, UART, SPIs, CAN, PMIC clocking module, PWM, and others) connected to Main Interconnect through Peripheral Central Resource (PCR interconnect).

Details of the DSP CPU core can be found at http://www.ti.com/product/TMS320C6748.

HIL module is shown in both the subsystems and can be used to perform the radar operations feeding the captured data from outside into the device without involving the RF subsystem. HIL on MSS is for controlling the configuration and HIL on DSPSS for high speed ADC data input to the device. Both HIL modules uses the same IOs on the device, one additional IO (DMM_MUX_IN) allows selecting either of the two.

Copyright © 2023 Texas Instruments Incorporated

8.3.3 Host Interface

The host interface can be provided through a SPI, UART, or CAN-FD interface. In some cases the serial interface for industrial applications is transcoded to a different serial standard.

The IWR1843AOP device communicates with the host radar processor over the following main interfaces:

- Reference Clock – Reference clock available for host processor after device wakeup
- Control – 4-port standard SPI (peripheral) for host control . All radio control commands (and response) flow through this interface.
- Reset – Active-low reset for device wakeup from host
- Error – Used for notifying the host in case the radio controller detects a fault

8.3.4 Main Subsystem Cortex-R4F Memory Map

表 8-1 shows the main subsystem, Cortex-R4F memory map.

注

There are separate Cortex-R4F addresses and DMA MSS addresses for the main subsystem. See the Technical Reference Manual for a complete list.

8.4 Other Subsystems

8.4.1 ADC Channels (Service) for User Application

The IWR1843AOP device includes provision for an ADC service for user application, where the

GPADC engine present inside the device can be used to measure up to six external voltages. The ADC1, ADC2, ADC3, ADC4, ADC5, and ADC6 pins are used for this purpose.

- ADC itself is controlled by TI firmware running inside the BIST subsystem and access to it for customer's external voltage monitoring purpose is via 'monitoring API' calls routed to the BIST subsystem. This API could be linked with the user application running on the MSS R4F.
- BIST subsystem firmware will internally schedule these measurements along with other [1]RF and Analog monitoring operations. The API allows configuring the settling time (number of ADC samples to skip) and number of consecutive samples to take. At the end of a frame, the minimum, maximum and average of the readings will be reported for each of the monitored voltages.

GPADC Specifications:

- 625 Ksps SAR ADC
- 0 to 1.8V input range
- 10-bit resolution
- For 5 out of the 6 inputs, an optional internal buffer is available. Without the buffer, the ADC has a switched capacitor input load modeled with 5pF of sampling capacitance and 12pF parasitic capacitance (GPADC channel 6, the internal buffer is not available).

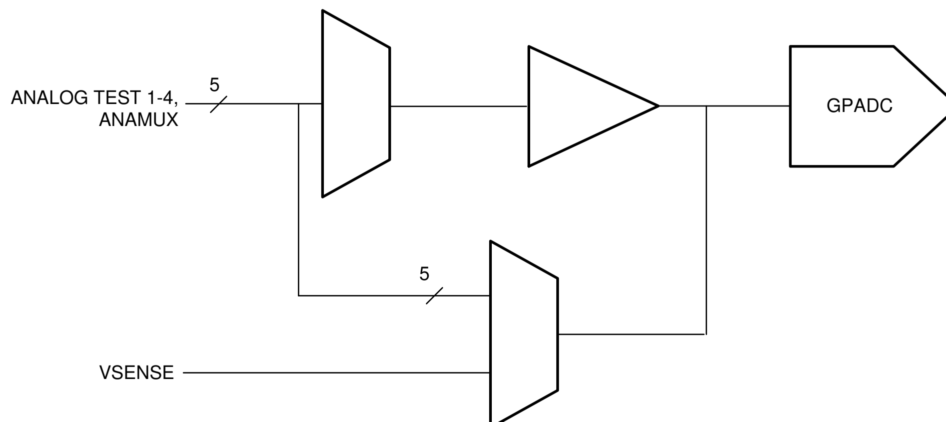

図 8-5. ADC Path

[1] GPADC structures are used for measuring the output of internal temperature sensors. The accuracy of these measurements is ±7°C

8.4.1.1 GP-ADC Parameter

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TYP	UNIT
ADC supply	1.8	V
ADC unbuffered input voltage range	0 – 1.8	V
ADC buffered input voltage range(1)	0.4 – 1.3	V
ADC resolution	10	bits
ADC offset error	±5	LSB
ADC gain error	±5	LSB
ADC DNL	–1/+2.5	LSB
ADC INL	±2.5	LSB
ADC sample rate(2)	625	Ksps
ADC sampling time(2)	400	ns
ADC internal cap	10	pF
ADC buffer input capacitance	2	pF
ADC input leakage current	3	uA

(1) Outside of given range, the buffer output will become nonlinear.
(2) ADC itself is controlled by TI firmware running inside the BIST subsystem. For more details please refer to the API calls.

9 Monitoring and Diagnostics

9.1 Monitoring and Diagnostic Mechanisms

Below is the list given for the main monitoring and diagnostic mechanisms available in the Functional Safety-Compliant IWR1843AOP device.

表 9-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant IWR1843AOP device

S No	Feature	Description
1	Boot time LBIST For MSS R4F Core and associated VIM	IWR1843AOP architecture supports hardware logic BIST (LBIST) engine self-test Controller (STC). This logic is used to provide a very high diagnostic coverage (>90%) on the MSS R4F CPU core and Vectored Interrupt Module (VIM) at a transistor level. LBIST for the CPU and VIM need to be triggered by application code before starting the functional safety application. CPU stays there in while loop and does not proceed further if a fault is identified.
2	Boot time PBIST for MSS R4F TCM Memories	MSS R4F has three Tightly coupled Memories (TCM) memories TCMA, TCMB0 and TCMB1. IWR1843AOP architecture supports a hardware programmable memory BIST (PBIST) engine. This logic is used to provide a very high diagnostic coverage (March-13n) on the implemented MSS R4F TCMs at a transistor level. PBIST for TCM memories is triggered by Bootloader at the boot time before starting download of application from Flash or peripheral interface. CPU stays there in while loop and does not proceed further if a fault is identified.
3	End to End ECC for MSS R4F TCM Memories	TCMs diagnostic is supported by Single error correction double error detection (SECDED) ECC diagnostic. An 8-bit code word is used to store the ECC data as calculated over the 64-bit data bus. ECC evaluation is done by the ECC control logic inside the CPU. This scheme provides end-to-end diagnostics on the transmissions between CPU and TCM. CPU can be configured to have predetermined response (Ignore or Abort generation) to single and double bit error conditions.
4	MSS R4F TCM bit multiplexing	Logical TCM word and its associated ECC code is split and stored in two physical SRAM banks. This scheme provides an inherent diagnostic mechanism for address decode failures in the physical SRAM banks. Faults in the bank addressing are detected by the CPU as an ECC fault. Further, bit multiplexing scheme implemented such that the bits accessed to generate a logical (CPU) word are not physically adjacent. This scheme helps to reduce the probability of physical multi-bit faults resulting in logical multi-bit faults; rather they manifest as multiple single bit faults. As the SECDED TCM ECC can correct a single bit fault in a logical word, this scheme improves the usefulness of the TCM ECC diagnostic. Both these features are hardware features and cannot be enabled or disabled by application software.
5	Clock Monitor	IWR1843AOP architecture supports Three Digital Clock Comparators (DCCs) and an internal RCOSC. Dual functionality is provided by these modules – Clock detection and Clock Monitoring. DCCint is used to check the availability/range of Reference clock at boot otherwise the device is moved into limp mode (Device still boots but on 10MHz RCOSC clock source. This provides debug capability). DCCint is only used by boot loader during boot time. It is disabled once the APLL is enabled and locked. DCC1 is dedicated for APLL lock detection monitoring, comparing the APLL output divided version with the Reference input clock of the device. Initially (before configuring APLL), DCC1 is used by bootloader to identify the precise frequency of reference input clock against the internal RCOSC clock source. Failure detection for DCC1 would cause the device to go into limp mode. DCC2 module is one which is available for user software . From the list of clock options given in detailed spec, any two clocks can be compared. One example usage is to compare the CPU clock with the Reference or internal RCOSC clock source. Failure detection is indicated to the MSS R4F CPU via Error Signaling Module (ESM).

Copyright © 2023 Texas Instruments Incorporated

表 9-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant IWR1843AOP device (続き)

S No	Feature	Description
7	RTI/WD for MSS R4F	IWR1843AOP architecture supports the use of an internal watchdog that is implemented in the real-time interrupt (RTI) module. The internal watchdog has two modes of operation: digital watchdog (DWD) and digital windowed watchdog (DWWD). The modes of operation are mutually exclusive; the designer can elect to use one mode or the other but not both at the same time. Watchdog can issue either an internal (warm) system reset or a CPU non-mask able interrupt upon detection of a failure. The Watchdog is enabled by the bootloader in DWD mode at boot time to track the boot process. Once the application code takes up the control, Watchdog can be configured again for mode and timings based on specific customer requirements.
8	MPU for MSS R4F	Cortex-R4F CPU includes an MPU. The MPU logic can be used to provide spatial separation of software tasks in the device memory. Cortex-R4F MPU supports 12 regions. It is expected that the operating system controls the MPU and changes the MPU settings based on the needs of each task. A violation of a configured memory protection policy results in a CPU abort.
9	PBIST for Peripheral interface SRAMs - SPIs, CANs	IWR1843AOP architecture supports a hardware programmable memory BIST (PBIST) engine for Peripheral SRAMs as well. PBIST for peripheral SRAM memories can be triggered by the application. User can elect to run the PBIST on one SRAM or on groups of SRAMs based on the execution time, which can be allocated to the PBIST diagnostic. The PBIST tests are destructive to memory contents, and as such are typically run only at boot time. However, the user has the freedom to initiate the tests at any time if peripheral communication can be hindered. Any fault detected by the PBIST results in an error indicated in PBIST status registers.
10	ECC for Peripheral interface SRAMs – SPIs, CANs	Peripheral interface SRAMs diagnostic is supported by Single error correction double error detection (SECDED) ECC diagnostic. When a single or double bit error is detected the MSS R4F is notified via ESM (Error Signaling Module). This feature is disabled after reset. Software must configure and enable this feature in the peripheral and ESM module. ECC failure (both single bit corrected and double bit uncorrectable error conditions) is reported to the MSS R4F as an interrupt via ESM module.
11	Configuration registers protection for MSS peripherals	All the MSS peripherals (SPIs, CANs, I2C, DMAs, RTI/WD, DCCs, IOMUX etc.) are connected to interconnect via Peripheral Central resource (PCR). This provides two diagnostic mechanisms that can limit access to peripherals. Peripherals can be clock gated per peripheral chip select in the PCR. This can be utilized to disable unused features such that they cannot interfere. In addition, each peripheral chip select can be programmed to limit access based on privilege level of transaction. This feature can be used to limit access to entire peripherals to privileged operating system code only. These diagnostic mechanisms are disabled after reset. Software must configure and enable these mechanisms. Protection violation also generates an ‘error’ that result in abort to MSS R4F or error response to other controllers such as DMAs.
12	Cyclic Redundancy Check – MSS	IWR1843AOP architecture supports hardware CRC engine on MSS implementing the below polynomials. • CRC16 CCITT – 0x10 • CRC32 Ethernet – 0x04C11DB7 • CRC64 • CRC 32C – CASTAGNOLI – 0x1EDC6F4 • CRC32P4 – E2E Profile4 – 0xF4ACFB1 • CRC-8 – H2F Autosar – 0x2F • CRC-8 – VDA CAN – 0x1D The read operation of the SRAM contents to the CRC can be done by CPU or by DMA. The comparison of results, indication of fault, and fault response are the responsibility of the software managing the test.
13	MPU for DMAs	IWR1843AOP architecture supports MPUs on MSS DMAs. Failure detection by MPU is reported to the MSS R4F CPU core as an interrupt via ESM. DSPSS’s high performance EDMAs also includes MPUs on both read and writes controller ports. EDMA MPUs supports 8 regions. Failure detection by MPU is reported to the DSP core as an interrupt via local ESM.

表 9-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant IWR1843AOP device (続き)

S No	Feature	Description
14	Boot time LBIST For BIST R4F Core and associated VIM	IWR1843AOP architecture supports hardware logic BIST (LBIST) even for BIST R4F core and associated VIM module. This logic provides very high diagnostic coverage (>90%) on the BIST R4F CPU core and VIM. This is triggered by MSS R4F boot loader at boot time and it does not proceed further if the fault is detected.
15	Boot time PBIST for BIST R4F TCM Memories	IWR1843AOP architecture supports a hardware programmable memory BIST (PBIST) engine for BIST R4F TCMs which provide a very high diagnostic coverage (March-13n) on the BIST R4F TCMs. PBIST is triggered by MSS R4F Bootloader at the boot time and it does not proceed further if the fault is detected.
16	End to End ECC for BIST R4F TCM Memories	BIST R4F TCMs diagnostic is supported by Single error correction double error detection (SECDED) ECC diagnostic. Single bit error is communicated to the BIST R4FCPU while double bit error is communicated to MSS R4F as an interrupt so that application code becomes aware of this and takes appropriate action.
17	BIST R4F TCM bit multiplexing	Logical TCM word and its associated ECC code is split and stored in two physical SRAM banks. This scheme provides an inherent diagnostic mechanism for address decode failures in the physical SRAM banks and helps to reduce the probability of physical multi-bit faults resulting in logical multi-bit faults.
18	RTI/WD for BIST R4F	Device architecture supports an internal watchdog for BIST R4F. Timeout condition is reported via an interrupt to MSS R4F and rest is left to application code to either go for SW reset for BIST SS or warm reset for the device to come out of faulty condition.
19	Boot time PBIST for L1P, L1D, L2 and L3 Memories	Device architecture supports a hardware programmable memory BIST (PBIST) engine for DSPSS's L1P, L1D, L2 and L3 memories which provide a very high diagnostic coverage (March-13n). PBIST is triggered by MSS R4F Bootloader at the boot time and it does not proceed further if the fault is detected.
20	Parity on L1P	Device architecture supports Parity diagnostic on DSP's L1P memory. Parity error is reported to the CPU as an interrupt. Note:- L1D memory is not covered by parity or ECC and need to be covered by application level diagnostics.
21	ECC on DSP's L2 Memory	Device architecture supports both Parity Single error correction double error detection (SECDED) ECC diagnostic on DSP's L2 memory. L2 Memory is a unified 256KB of memory used to store program and Data sections for the DSP. A 12-bit code word is used to store the ECC data as calculated over the 256-bit data bus (logical instruction fetch size). The ECC logic for the L2 access is located in the DSP and evaluation is done by the ECC control logic inside the DSP. This scheme provides end-to-end diagnostics on the transmissions between DSP and L2. Byte aligned Parity mechanism is also available on L2 to take care of data section.
22	ECC on Radar Data Cube (L3) Memory	L3 memory is used as Radar data section in Device. Device architecture supports Single error correction double error detection (SECDED) ECC diagnostic on L3 memory. An 8-bit code word is used to store the ECC data as calculated over the 64-bit data bus. Failure detection by ECC logic is reported to the MSS R4F CPU core as an interrupt via ESM.
23	RTI/WD for DSP Core	Device architecture supports the use of an internal watchdog for BIST R4F that is implemented in the real-time interrupt (RTI) module – replication of same module as used in MSS. This module supports same features as that of RTI/WD for MSS/BIST R4F. This watchdog is enabled by customer application code and Timeout condition is reported via an interrupt to MSS R4F and rest is left to application code in MSS R4F to either go for SW reset for DSP SS or warm reset for the device to come out of faulty condition.
24	CRC for DSP Sub-System	Device architecture supports dedicated hardware CRC on DSPSS implementing the below polynomials. • CRC16 CCITT - 0x10 • CRC32 Ethernet - 0x04C11DB7 • CRC64 The read of SRAM contents to the CRC can be done by DSP CPU or by DMA. The comparison of results, indication of fault, and fault response are the responsibility of the software managing the test.

表 9-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant IWR1843AOP device (続き)

S No	Feature	Description
25	MPU for DSP	Device architecture supports MPUs for DSP memory accesses (L1D, L1P, and L2). L2 memory supports 64 regions and 16 regions for L1P and L1D each. Failure detection by MPU is reported to the DSP core as an abort.
26	Temperature Sensors	Device architecture supports various temperature sensors all across the device (next to power hungry modules such as PAs, DSP etc) which is monitored during the inter-frame period.(1)
27	Tx Power Monitors	Device architecture supports power detectors at the Tx output.(2)
28	Error Signaling Error Output	When a diagnostic detects a fault, the error must be indicated. The Device architecture provides aggregation of fault indication from internal monitoring/diagnostic mechanisms using a peripheral logic known as the Error Signaling Module (ESM). The ESM provides mechanisms to classify errors by severity and to provide programmable error response. ESM module is configured by customer application code and specific error signals can be enabled or masked to generate an interrupt (Low/High priority) for the MSS R4F CPU. Device supports Nerror output signal (IO) which can be monitored externally to identify any kind of high severity faults in the design which could not be handled by the R4F.
29	Synthesizer (Chirp) frequency monitor	Monitors Synthesizer's frequency ramp by counting (divided-down) clock cycles and comparing to ideal frequency ramp. Excess frequency errors above a certain threshold, if any, are detected and reported.
30	Ball break detection for TX ports (TX Ball break monitor)	Device architecture supports a ball break detection mechanism based on Impedance measurement at the TX output(s) to detect and report any large deviations that can indicate a ball break. Monitoring is done by TIs code running on BIST R4F and failure is reported to the MSS R4F via Mailbox. It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F.
31	RX loopback test	Built-in TX to RX loopback to enable detection of failures in the RX path(s), including Gain/ Noise figure, inter-RX balance, etc.
32	IF loopback test	Built-in IF (square wave) test tone input to monitor IF filter's frequency response and detect failure.
33	RX saturation detect	Provision to detect ADC saturation due to excessive incoming signal level and/or interference.
34	Boot time LBIST for DSP core	Device supports boot time LBIST for the DSP Core. LBIST can be triggered by the MSS R4F application code during boot time.

(1) Monitoring is done by the TI's code running on BIST R4F. There are two modes in which it could be configured to report the temperature sensed via API by customer application.
  a. Report the temperature sensed after every N frames
  b. Report the condition once the temperature crosses programmed threshold.

  It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4Fvia Mailbox.

(2) Monitoring is done by the TI's code running on BIST R4F.
  There are two modes in which it could be configured to report the detected output power via API by customer application.
  a. Report the power detected after every N frames
  b. Report the condition once the output power degrades by more than configured threshold from the configured.

  It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F.

注

Refer to the Device Safety Manual or other relevant collaterals for more details on applicability of all diagnostics mechanisms. For Certification details, refer to the Device product folder.

9.1.1 Error Signaling Module

When a diagnostic detects a fault, the error must be indicated. IWR1843AOP architecture provides aggregation of fault indication from internal diagnostic mechanisms using a peripheral logic known as the error signaling module (ESM). The ESM provides mechanisms to classify faults by severity and allows programmable error response. Below is the high level block diagram for ESM module.

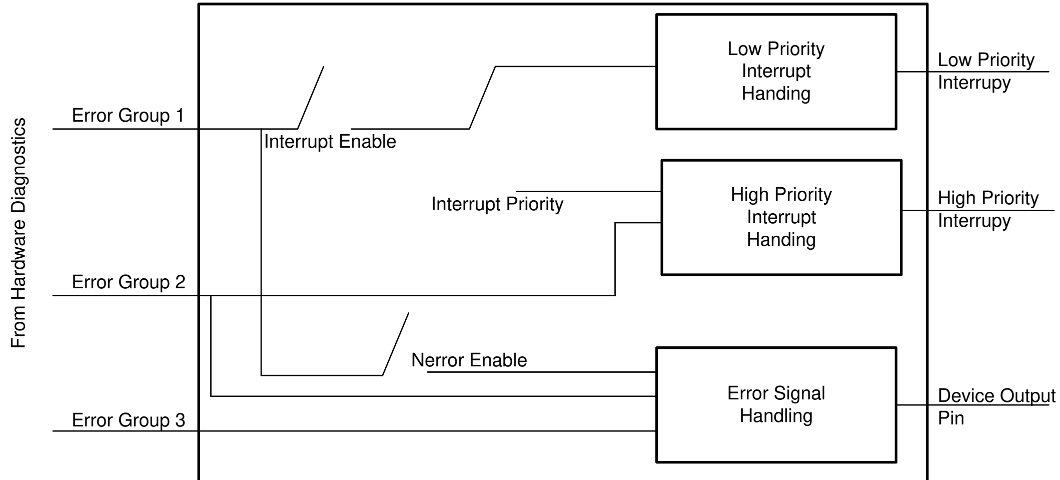

図 9-1. ESM Module Diagram

10 Applications, Implementation, and Layout

注

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

Application information can be found on IWR Application web page.

10.2 Reference Schematic

The reference schematic and power supply information can be found in the IWR1843AOP EVM Documentation.

Listed for convenience are: Design Files, Schematics, Layouts, and Stack up for PCB.

11 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions follow.

11.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *IWR1843AOP*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ALP0180A), the temperature range (for example, blank is the default commercial temperature range). 図 11-1 provides a legend for reading the complete device name for any *IWR1843AOP* device.

For orderable part numbers of *IWR1843AOP* devices in the ALP0180 package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the *IWR1843AOP Device Errata*.

図 11-1. Device Nomenclature

注

The silicon revision information, Rev2.0, is different from the device revision information, ES1.0, mentioned in the Errata document. The device revision information ES1.0 is related to both silicon and package revisions.

11.2 Tools and Software

Models

IWR1843AOP IBIS model IO buffer information model for the IO buffers of the device. For simulation on a circuit board, see IBIS Open Forum.

11.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the DSP, related peripherals, and other technical collateral follows.

Errata

IWR1843AOP device errata Describes known advisories, limitations, and cautions on silicon and provides workarounds.

11.4 サポート・リソース

TI E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の使用条件を参照してください。

11.6 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

12 Mechanical, Packaging, and Orderable Information

12.1 Packaging Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

注意

The following package information is subject to change without notice.

注

Variability in the color (or appearance) of Texas Instrument's (TI's) Antenna-on-Package (AoP) product is normal and expected. This variation is not indicative of any degradation or variability to the performance specifications of the AoP products.

IWR1843ARQGALPR	ACTIVE	FCCSP	ALP	180	1000	RoHS & Green	Call TI	Level-3-260C-168 HR	-40 to 105	IWR1843 QG	Samples

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:
