LMG1020 5V、7A、5AのローサイドGaNおよびMOSFETドライバ、1nsパルス幅のアプリケーション用

1 特長

- GaNおよびシリコンFET用の超高速ローサイド・ゲート・ドライバ
- 最小入力パルス幅: 1ns
- 最高60MHzでの動作
- 標準2.5ns、最大4.5nsの伝搬遅延
- 400psの標準立ち上がりおよび立ち下がり時間
- 7Aピーク・ソース電流および5Aピーク・シンク電流
- 5Vの電源電圧
- UVLOおよび過熱保護
- 0.8mm×1.2mmのWCSPパッケージ

2 アプリケーション

- LiDAR
- タイム・オブ・フライト(ToF)レーザー・ドライバ
- 顔認識
- クラスEワイヤレス充電器
- VHF共振電力コンバータ
- GaNベースの同期整流器
- 拡張現実

3 概要

LMG1020デバイスはシングル、ローサイドのドライバで、LiDAR、タイム・オブ・フライト、顔認識などの高速アプリケーションや、ローサイド・ドライバを使用するあらゆる電力コンバータで、GaN FETおよびロジック・レベルMOSFETを駆動するよう設計されています。LMG1020は設計が単純なため、伝播遅延が2.5ナノ秒と非常に短く、最小で1ナノ秒のパルス幅に対応できます。ゲートと、OUTHおよびOUTLとの間に外付けの抵抗を接続することで、それぞれプルアップ・エッジとプルダウン・エッジの駆動強度を独立に設定できます。

ドライバには、過負荷またはフォルト状況に対応するため、低電圧誤動作防止(UVLO)および過熱保護(OTP)機能があります。

LMG1020は0.8mm×1.2mmのWCSPパッケージを使用しており、ゲート・ループのインダクタンスが最小化され、高周波数のアプリケーションで電力密度を最大化できます。

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
V_{DD}	Supply voltage		5.75	V
V_{IN}	IN+, IN- pin voltage	-0.3	V_{DD} + 0.3	V
V_{OUT}	OUTH, OUTL pin voltage	-0.3	5.75	V
T_{STG}	Storage Temperature	-55	150	°C
T_J	Operating Temperature	-40	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{DD}	Supply voltage	4.75	5	5.4	V
V_{INx}	IN+ or IN- input voltage	0		V_{DD}	V
T_J	Operating Temperature	-40		125	°C

6.4 Thermal Information

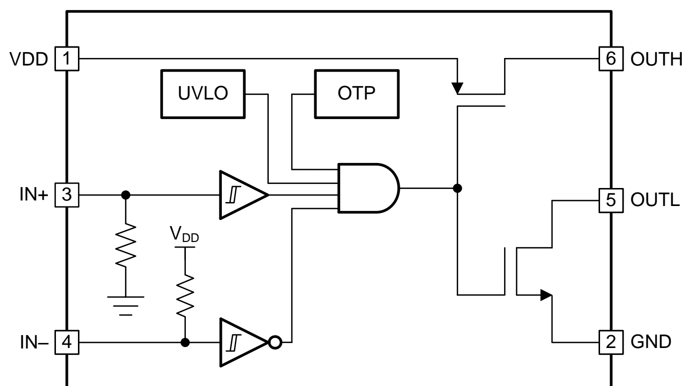
7 Detailed Description

7.1 Overview

LMG1020 is a high-performance low-side 5-V gate driver for GaN and logic-level silicon power transistors. While the LMG1020 is designed for high-speed applications, such as wireless power transmission and LiDAR applications, it is a high-performance solution for any other low-side driving applications.

The LMG1020 is optimized to provide the lowest propagation delay through the driver to the power transistor. LMG1020 is in a small 0.8×1.2mm WCSP ball-grid array package in order to minimize its parasitic inductance. This low inductance design helps achieve high current, low ringing performance in very high frequency operation when driving power FETs.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Input Stage

The input stage features two Schmitt-triggers at the pins IN+ and IN– to reduce sensitivity to noise on the inputs. IN+ signal and the inverted IN– signal are both sent to an AND gate. IN+ is connected with a pull-down resistor while IN– is connected with a pull-up resistor to prevent unintended turnon. The output signal will follow the difference between IN+ and IN–. Both IN+ and IN– are single ended inputs, and these two pins cannot be used as a differential input pair.

7.3.2 Output Stage

LMG1020 provides 7-A source, 5-A sink (asymmetrical drive) peak-drive current capability, and features a split output configuration. The OUTH and OUTL outputs of the LMG1020 allow the user to use independent resistors connecting to the gate. The two resistors allow the user to independently adjust the turnon and turnoff drive strengths to control slew rate and EMI, and to control ringing on the gate signal. For GaN FETs, controlling ringing is important to reduce stress on the GaN FET and driver. The output stage OUTL is also pulled down in undervoltage condition, which prevents the unintended charge accumulation of device C_{iss}.

7.3.3 V_{DD} and undervoltage lockout

LMG1020 features nominal 5V and maximum 5.25V of supply voltage, and its absolute maximum supply voltage is 5.75 V. In the design, it is recommended to limit the variability of the power supply to be within 5% (0.25V), and the overshoot voltage during switching transient not to exceed the absolute maximum voltage. Refer to Section VDD and Overshoot for more the detailed design guide.

LMG1020 also features internal undervoltage lockout (UVLO) to protect the driver and circuit in case of fault conditions. The UVLO point is setup between 4.1V and 4.2V with a hysteresis of 85mV. This UVLO level is specifically designed to guarantee that GaN power devices can be switched at a low $R_{DS(ON)}$ region. During UVLO condition, the OUTL is pulled down to ground.

Feature Description (continued)

7.3.4 Overtemperature Protection (OTP)

LMG1020 features overtemperature protection (OTP) function by having a rising edge trigger point at around 170°C. With a hysteresis of 20°C, the device can restart to operate when junction temperature is below 150°C.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

To operate GaN transistors at very high switching frequencies and to reduce associated switching losses, a powerful gate driver is employed between the PWM output of controller and the gates of the GaN transistor. Also, gate drivers are indispensable when the outputs of the PWM controller do not meet the voltage or current levels needed to directly drive the gates of the switching devices. With the advent of digital power, this situation is often encountered because the PWM signal from the digital controller is often a 3.3 V logic signal, which cannot effectively turn on a power switch. A level-shift circuit is needed to boost the 3.3 V signal to the gate-drive voltage (such as 5 V) in order to fully turn on the power device and minimize conduction losses.

Gate drivers effectively provide the buffer-drive functions. Gate drivers also address other needs such as minimizing the effect of high-frequency switching noise (by placing the high-current driver IC physically close to the power switch), reducing power dissipation and thermal stress in controllers by moving gate charge power losses from the controller into the driver.

The LMG1020 is a 60-MHz low-side gate driver for enhancement mode GaN FETs and Si FETs in a single-ended configuration. The split-gate outputs with strong source and sink capability provides flexibility to adjust the turnon and turnoff strength independently. As a low side driver, LMG1020 can be used in a variety of applications, including different power converters, LiDAR, time-of-flight laser drivers, class-E wireless chargers, synchronous rectifiers, and augmented reality. LMG1020 can also be used as a high frequency low current laser diode driver, or as a signal buffer with very fast rise/fall time.

8.2 Typical Application

The LMG1020 is designed to be used with a single low-side, ground-referenced GaN or logic-level Si FET, as shown in 図 6. Independent gate drive resistors, R1 and R2, are used to independently control the turnon and turnoff drive strengths, respectively. For fast and strong turnoff, R2 can be shorted and OUTL directly connected to the transistor's gate. For symmetric drive strengths, it is acceptable to short OUTH and OUTL and use a single gate-drive resistor.

TI recommends using at least a 2 Ω resistor at each OUTH and OUTL to avoid voltage overstress due to inductive ringing. Ringing overshoot must not exceed the maximum absolute supply voltage.

For applications requiring smaller resistance values, contact TI E2E for guidance.

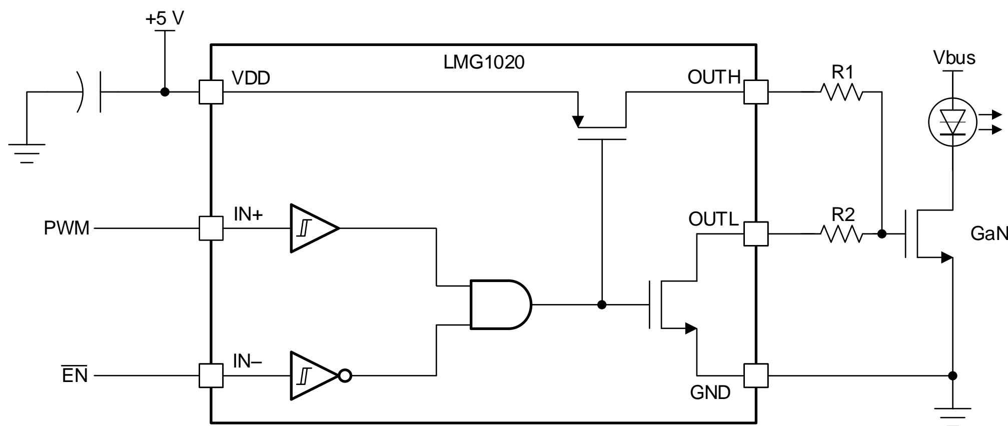

図 6. Typical Implementation of a Circuit

Copyright © 2018, Texas Instruments Incorporated

Typical Application (continued)

8.2.1 Design Requirements

When designing a multi-MHz (or nano-second pulse) application that incorporates the LMG1020 gate driver and GaN power FETs, some design considerations must be evaluated first to make the most appropriate selection. Among these considerations are layout optimization, circuit voltages, passive components, operating frequency, and controller selection.

8.2.2 Detailed Design Procedure

8.2.2.1 Handling Ground Bounce

For the best switching performance and gate loop with lowest parasitics, it is recommended to connect the ground return pin of LMG1020 as close as possible to the source of the low-side FET in a low inductance manner. However, doing so can cause the ground of LMG1020 to bounce relative to the system or controller ground and lead to erroneous switching logic on the input so as mis-turn on/off on the output.

First of all, LMG1020 has input hysteresis built into the input buffers to help counteract this effect. The maximum di/dt allowed to prevent the input voltage transient from exceeding the input hysteresis is given by 式 1

$$\frac{di_S}{dt} = \frac{V_{HYST}}{L_{RS}}$$

where

- L_{RS} is the inductance between FET source and ground,
- V_{HYST} is the hysteresis of the input pin,
- and $di_s/\Delta t$ is the maximum allowed current slew rate. (1)

For an assumed parasitic inductance of 0.5 nH and a minimum hysteresis of 0.5 V, the maximum slew rate is 1 A/ns. Many applications would exhibit higher current slew rates, up to the 10 A/ns range, which would make this approach impractical. The stability of this approach can be improved by using the IN– input for the PWM signal and locally tying IN+ to VDD. By using the inverting input, the transient voltage applied to the input pin reinforces the PWM signal in a positive feedback loop. While this approach would reduce the probability of false pulses or oscillation, the transient spikes due to high di/dt may overly stress the inputs to the LMG1020. A current-limiting, 100 Ω resistor can be placed right before the IN– input to limit excessive current spikes in the device.

Secondly, for moderate ground-bounce cases, a simple R-C filter can be built with a simple resistor in series with the inputs. By utilizing the input capacitance of LMG1020, the resistor could be close to its input pin. The addition of a small capacitor on the input as supplement can also be helpful. A small time constant of the R-C filter can can enough to filter out high frequency noises. This solution is acceptable for moderate cases in applications where extra delay is acceptable and the pulse width is not extremely short such as 1ns range.

For more extreme cases, or where no delay is tolerable while pulse width is extremely short, using a common-mode choke provides the best results.

One example application where ground-bounce is particularly challenging is when using a current sense resistor. In configuration A LMG1020 ground is connected to the source of GaN FET, while the controller ground is connected to the other side of the current sense resistor as shown in 図 7. Due to the fast switching and very fast current slew rates, the high ground potential bounce induced by inductance of the sense resistor can disrupt the operation of the circuit or even damage the part. To prevent this, a common-mode choke can be used for IN+ and IN–, respectively. Resistors can also added to the signal output line before LMG1020 depending on the input signal pulse width to provide additional RC filtering. 図 9 presents the schematic using approach A with the preferred filtering method. Approach B as 図 8 places the current sense resistor within the gate drive loop path. In this case, the LMG1020 GND pin is connected to the signal ground, and with good ground plane connection, the ground bounce issue can be less severe than approach A. However, the inductance of the current sense resistor adds common-source inductance to the gate drive loop. The voltage generated across this parasitic inductance will subtract from the gate-drive voltage of the FET, slowing down the turnon and turnoff di/dt of the FET, or even cause mis-turn on and off. Additional gate resistance will have to be added to ensure the loop is stable and ring-free. The slower rise may negate the advantage of the fast switching of the GaN FET and may cause additional losses in the circuit. Therefore, this approach is not recommended.

Typical Application (continued)

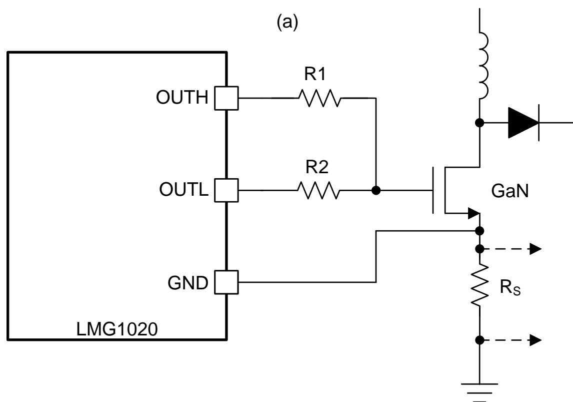

図 7. Source Resistor Current Sense A Configuration

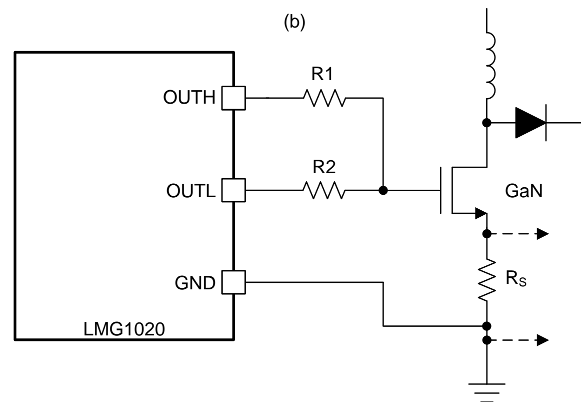

図 8. Source Resistor Current Sense B Configuration

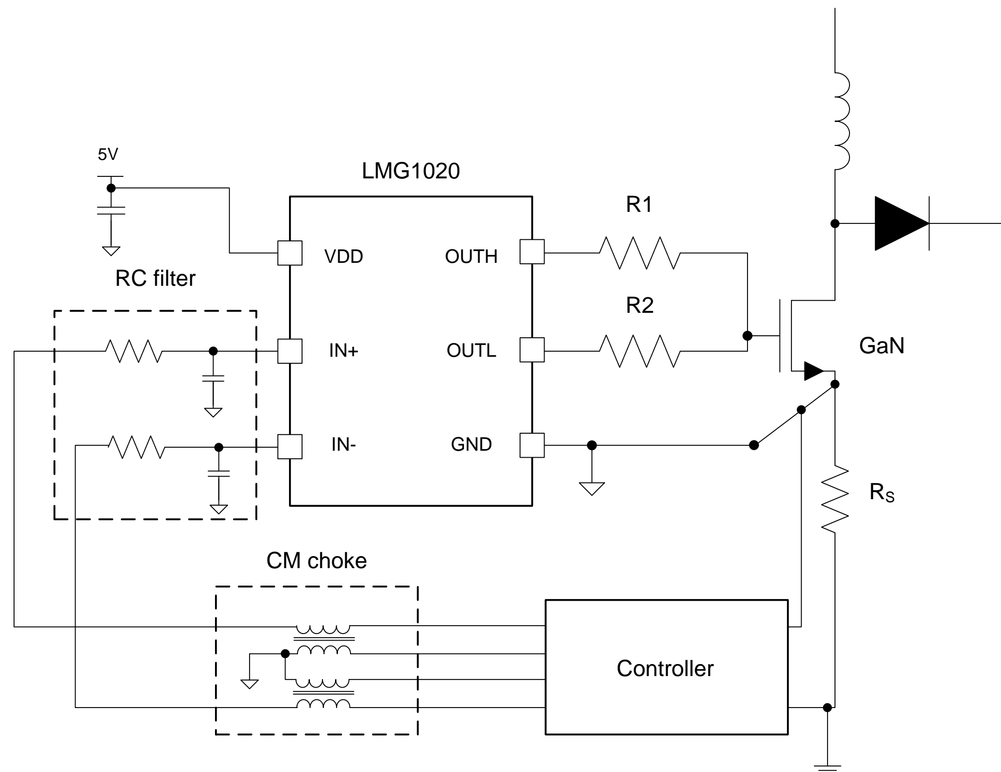

図 9. Filtering For Ground Bounce Noise Handling When Using LMG1020

8.2.2.2 Creating Nanosecond Pulse With LMG1020

LMG1020 can be used to drive pulses of nano seconds duration on to a capacitive load. LMG1020 can be driven with a equivalently short pulse on one input pin. However, this takes a sufficiently strong digital driver and careful consideration of the routing parasitics from digital output to input of LMG1020. Two inputs and included AND gate in LMG1020 provide an alternate method to create a short pulse at the LMG1020 output. Starting with both IN+ and IN– at low, taking IN+ high will cause the output to go high. Now if IN– is taken high as well, output will be pulled low. So a digital signal and its delayed version can be applied to IN+ and IN– respectively to create a

Copyright © 2018, Texas Instruments Incorporated

Typical Application (continued)

pulse at the output with width corresponding to the delay between the signals, as shown in 図 10. The delay can be digitally controlled in the nanosecond range. This method alleviates the requirements for driving the input of LMG1020. If a separate delayed version of the digital signal is not available, a RC delay followed by a buffer can be used to derive the second signal. Optionally, if LMG1020 must be driven with a single short duration pulse, that pulse can itself be generated using another LMG1020 by the above method to meet drive requirements.

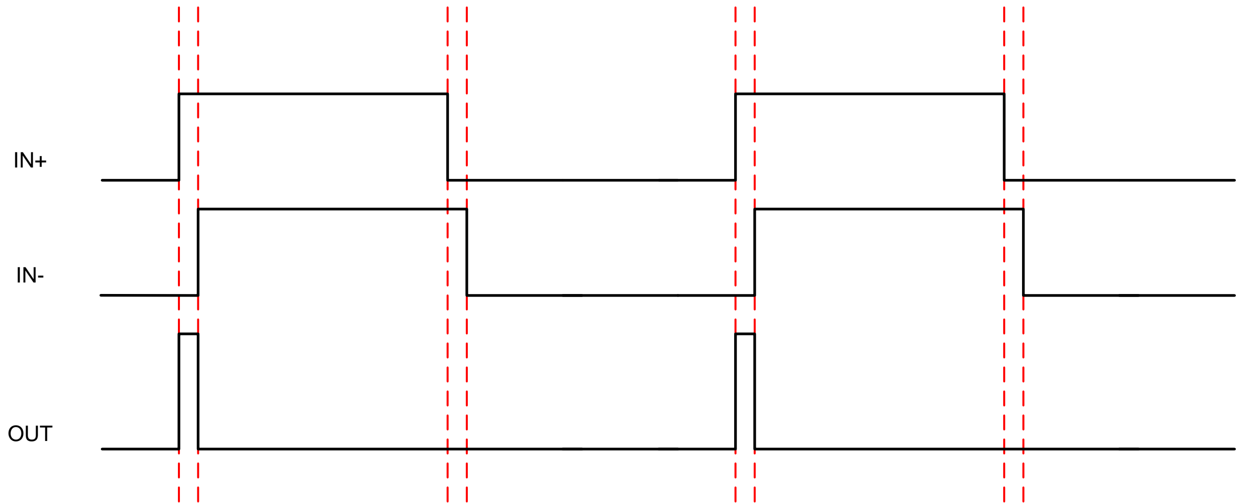

図 10. Timing Diagram To Create Short Pulses

8.2.3 VDD and Overshoot

Fast switching with high current is prone to ringing with parasitic inductances, including those on PCB traces. Overshoot associated with such ringing transients need to be evaluated and controlled as a part of the PCB design process to limit device stress. The parameters affecting stress are how high the overshoot is above the absolute maximum specification and the ratio of overshoot duration to the switching time period. Recommended design practice is to limit the overshoots to the absolute maximum pin voltages. This is accomplished with carful PCB layout to minimize parasitic inductances, choice of components with low ESL and addition of series resistance to limit rise times. For large overshoots, limiting the variability of the power supply may be required. For example, 0.5V of overshoot will be permissible with a maximum recommended supply of 5.25 V (5% variability); however, for larger overshoots, a supply with lower variability will be preferred.

8.2.4 Operating at Higher Frequency

With fast rise/fall time, and capability of achieving 1 ns pulse width, depending on the capacitive load condition, the operating frequency of LMG1020 can be increased in a burst manner. In conditions which requires very high frequency pulsing, a pulse train with certain period of pause between each burst can be adopted to avoid overheat of the device. This will help maintain the RMS output current similar as lower frequency operation but boost the transient frequency to very high. In addition, higher decoupling capacitance will be needed to supply high frequency charging of the capacitive load.

Typical Application (continued)

8.2.5 Application Curves

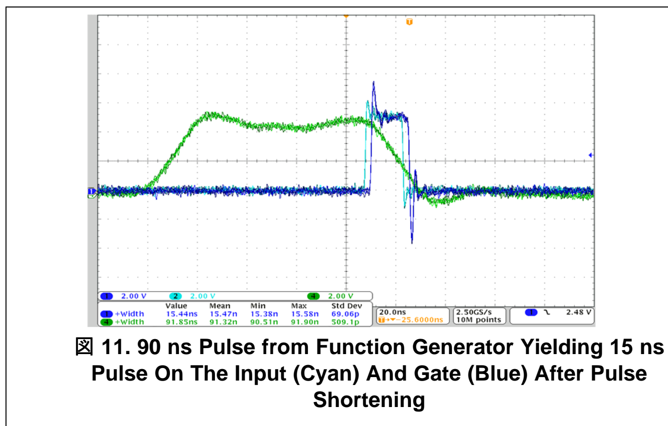

図 11. 90 ns Pulse from Function Generator Yielding 15 ns Pulse On The Input (Cyan) And Gate (Blue) After Pulse Shortening

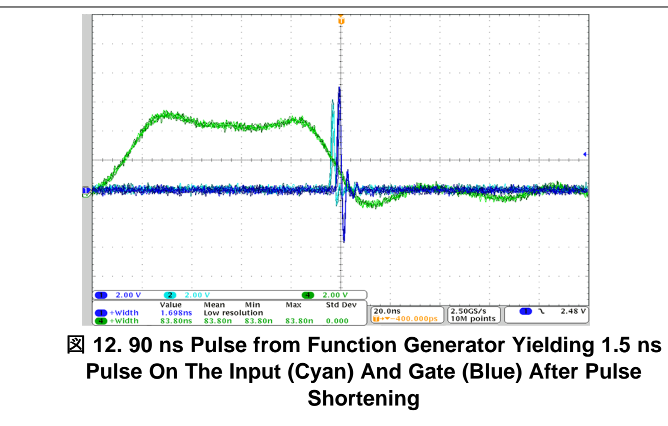

図 12. 90 ns Pulse from Function Generator Yielding 1.5 ns Pulse On The Input (Cyan) And Gate (Blue) After Pulse Shortening

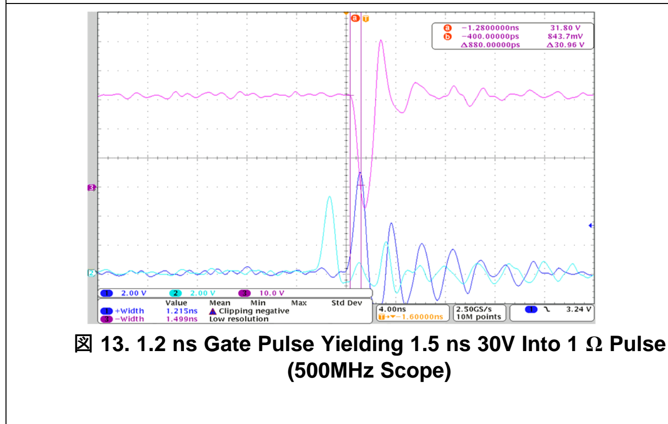

図 13. 1.2 ns Gate Pulse Yielding 1.5 ns 30V Into 1 Ω Pulse (500MHz Scope)

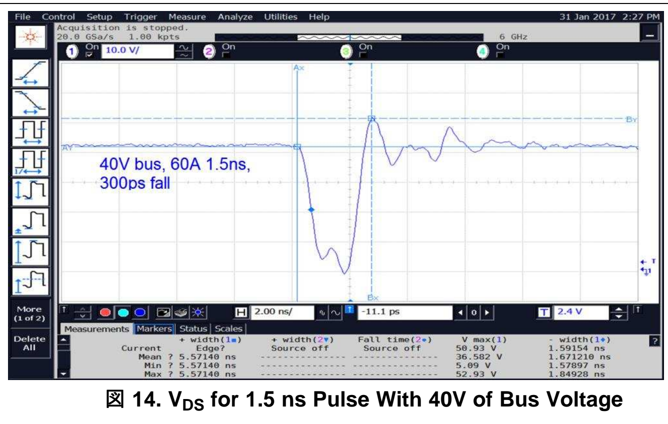

図 14. V_{DS} for 1.5 ns Pulse With 40V of Bus Voltage

図 11 and 図 12 are the waveforms showing the pulse short pulse generation and input/output pulses. The 90ns long pulse (in green color) and its delayed signal are sent through an AND gate, which outputs a short pulse signal as the input of LMG1020. The output signal (in blue color) follows the input (in cyan color) with certain propagation delay. An output pulse short as 1.5 ns can be obtained as 図 12.

図 13 is taken with a 500MHz oscilloscope and shows typical operation waveforms, including the input logic gating signal (cyan), gate signal (blue), and drain to source signal (pink) of the switching GaN FET. On the drain waveform of the FET, it is possible to see a 20V overshoot. This is due to the inductance in the power loop. Vg seems to be oscillating, but this is caused by pickup noise, which is inevitable even when using a spring ground connection.

図 14 shows the waveform of drain to source voltage of a FET driven by LMG1020 with 1.5ns pulse width and 300ps fall time, which drives maximum 60A current at 40V bus voltage.

9 Power Supply Recommendations

A low-ESR/ESL ceramic capacitor must be connected close to the IC, between V_{DD} and GND pins to support the high peak current being drawn from V_{DD} during turnon of the FETs. It is most desirable to place the V_{DD} decoupling capacitor on the same side of the PC board as the driver. The inductance of via holes can impose excessive ringing on the IC pins.

TI recommends the use of a three-terminal capacitor connecting in shunt-through manner to achieve the lowest ESL and best transient performance. This capacitor can be placed as close as possible to the IC, while another capacitor in larger capacitance can be placed closely to the three-terminal cap to supply enough charge but with slightly lower bandwidth. As a general practice, the combination of a 0.1 µF of 0402 or feed-through capacitor (closest to LMG1020) and a 1 µF 0603 capacitor is recommended.

Copyright © 2018, Texas Instruments Incorporated

10 Layout

10.1 Layout Guidelines

The layout of the LMG1020 is critical to its performance and functionality. The LMG1020 is available in a WCSP ball-grid array package, which enables low-inductance connection to a BGA-type GaN FET. 図 15 shows the recommended layout of the LMG1020 with a ball-grid array GaN FET. 図 16 presents a layout of LMG1020 with a 0.1 µF feed-through capacitor and a larger 1uF capacitor.

A four-layer or higher layer count board is required to reduce the parasitic inductances of the layout to achieve suitable performance. To minimize inductance and board space, resistors and capacitors in the 0201 package are used here. The gate drive power loss must be calculated to ensure an 0201 resistor will be able to handle the power level.

10.1.1 Gate Drive Loop Inductance and Ground Connection

A compact, low-inductance gate-drive loop is essential to achieving fast switching frequencies with the LMG1020. The LMG1020 should be placed as close to the GaN FET as possible, with gate drive resistors R1 and R2 immediately connecting OUTH and OUTL to the FET gate. Large traces must be used to minimize resistance and parasitic inductance.

To minimize gate drive loop inductance, the source return should be on layer 2 of the PCB, immediately under the component (top) layer. Vias immediately adjacent to both the FET source and the LMG1020 GND pin connect to this plane with minimal impedance. Finally, take care to connect the GND plane to the source power plane only at the FET to minimize common-source inductance and to reduce coupling to the ground plane.

10.1.2 Bypass Capacitor

The VDD power terminal of the LMG1020 must by bypassed to ground immediately adjacent to the IC. Because of the fast gate drive of the IC, the placement and value of the bypass capacitor is critical. The bypass capacitor must be place on the top layer, as close as possible to the IC, and connected to both VDD and GND using large power planes. This bypass capacitor has to be at least a 0.1 µF, up to 1 µF, with temperature coefficient X7R or better. Recommended body types are Low Inductance Chip Capacitor (LICC), Inter-Digitated Capacitor (IDC), Feed-through, and LGA. Finally, an additional 1 µF capacitor (not shown in 図 15) must be placed as close to the IC as practical.

10.2 Layout Example

図 15 presents a typical layout of LMG1020 with a 0402 decoupling capacitor C1, which is placed as close as possible to LMG1020. The ground return at GaN FET Kelvin source immediately flows through a via to the closest inner layer, and overlaps with the top layer traces.

図 16 presents a layout of LMG1020 with a 0.1 µF feed-through capacitor (C1) and a larger 1uF capacitor (C3) for decoupling. In this design, the feed-through capacitor C1 is placed in a shunt-through manner for lower noise decoupling, and C3 is placed next to C1. 0201 resistors are used at the output of LMG1020, which brings lower parasitic inductance than 0402 package.

11.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、ti.comのデバイス製品フォルダを開いてください。右上の「アラートを受け取る」をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取れます。変更の詳細については、修正されたドキュメントに含まれている改訂履歴をご覧ください。

11.3 コミュニティ・リソース

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™オンライン・コミュニティ ***TIのE2E（Engineer-to-Engineer）コミュニティ。*** エンジニア間の共同作業を促進するために開設されたものです。e2e.ti.comでは、他のエンジニアに質問し、知識を共有し、アイディアを検討して、問題解決に役立てることができます。

設計サポート ***TIの設計サポート*** 役に立つE2Eフォーラムや、設計サポート・ツールをすばやく見つけることができます。技術サポート用の連絡先情報も参照できます。

11.4 商標

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 静電気放電に関する注意事項

すべての集積回路は、適切なESD保護方法を用いて、取扱いと保存を行うようにして下さい。

静電気放電はわずかな性能の低下から完全なデバイスの故障に至るまで、様々な損傷を与えます。高精度の集積回路は、損傷に対して敏感であり、極めてわずかなパラメータの変化により、デバイスに規定された仕様に適合しなくなる場合があります。

11.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMG1020YFFR	ACTIVE	DSBGA	YFF	6	3000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 125	AT	Samples
LMG1020YFFT	ACTIVE	DSBGA	YFF	6	250	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 125	AT	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

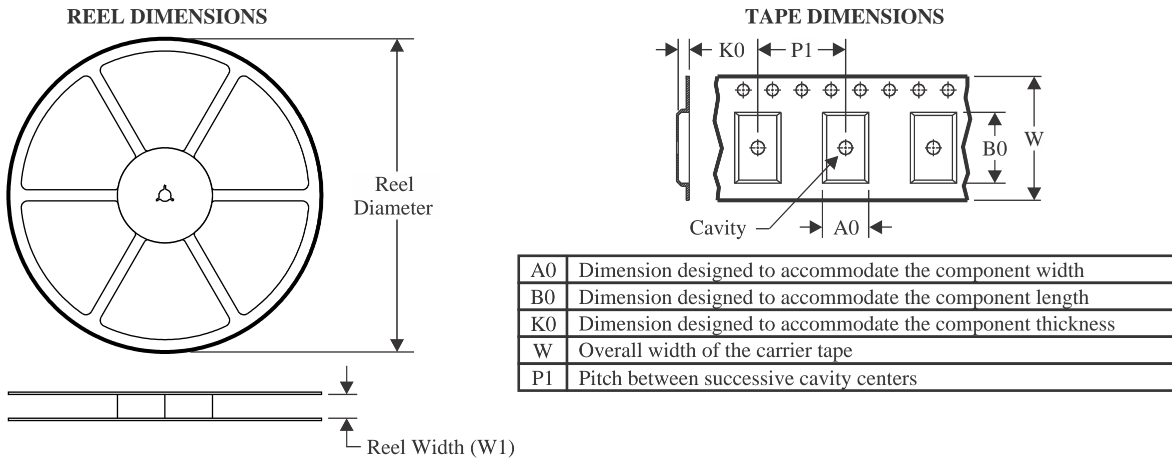
(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

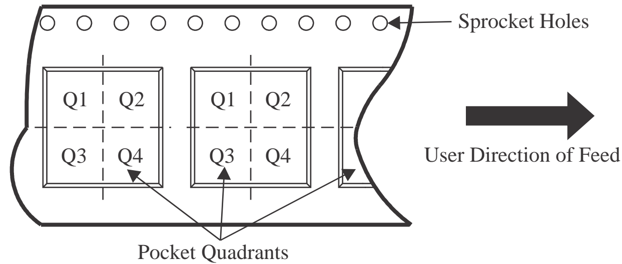
Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION



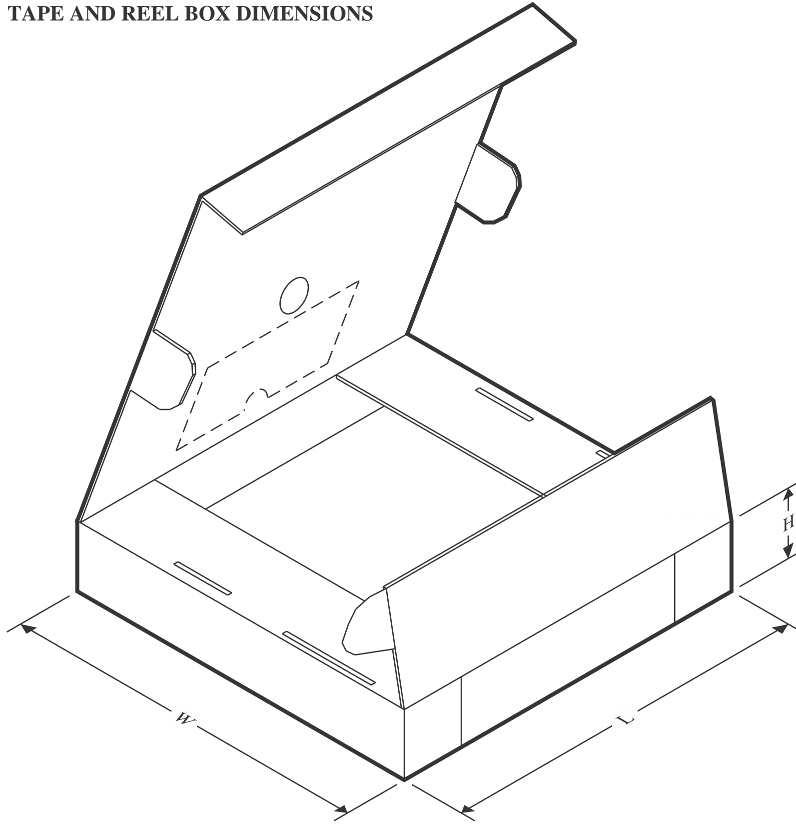
QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

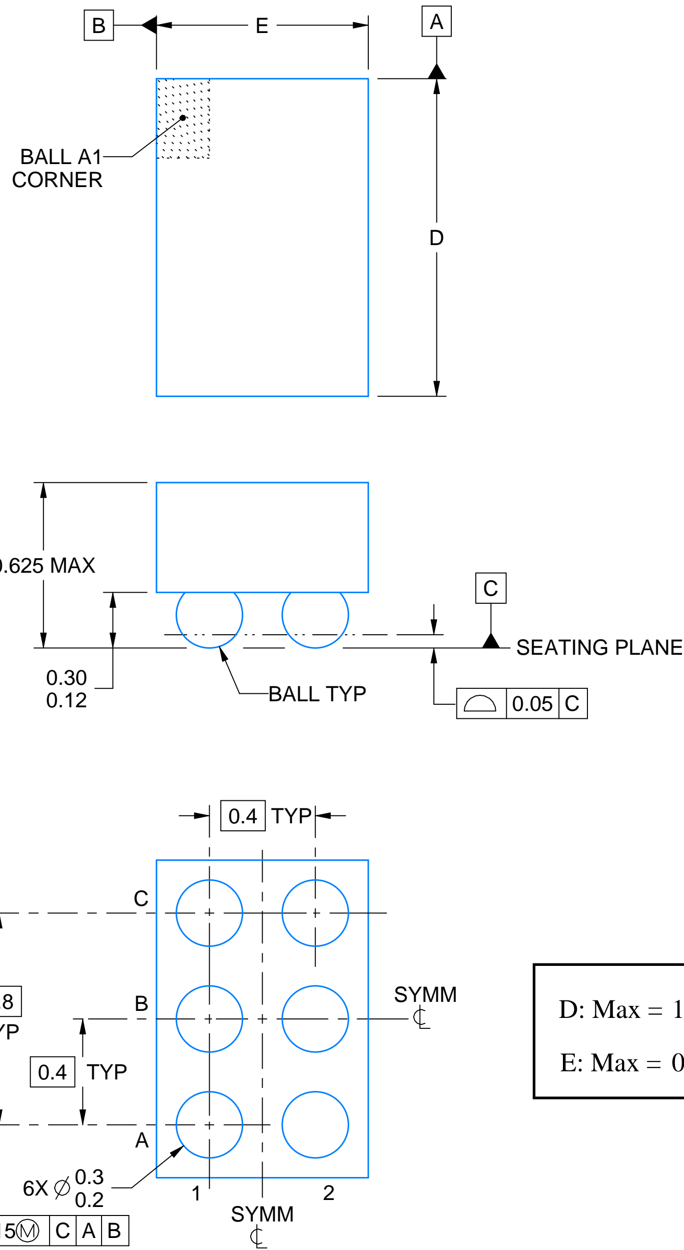
Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMG1020YFFR	DSBGA	YFF	6	3000	180.0	8.4	0.96	1.36	0.69	4.0	8.0	Q1
LMG1020YFFT	DSBGA	YFF	6	250	180.0	8.4	0.96	1.36	0.69	4.0	8.0	Q1

TAPE AND REEL BOX DIMENSIONS



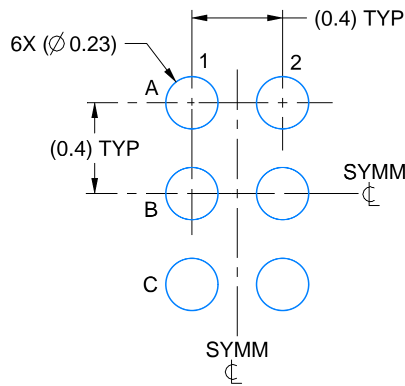
*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LMG1020YFFR	DSBGA	YFF	6	3000	182.0	182.0	20.0
LMG1020YFFT	DSBGA	YFF	6	250	182.0	182.0	20.0

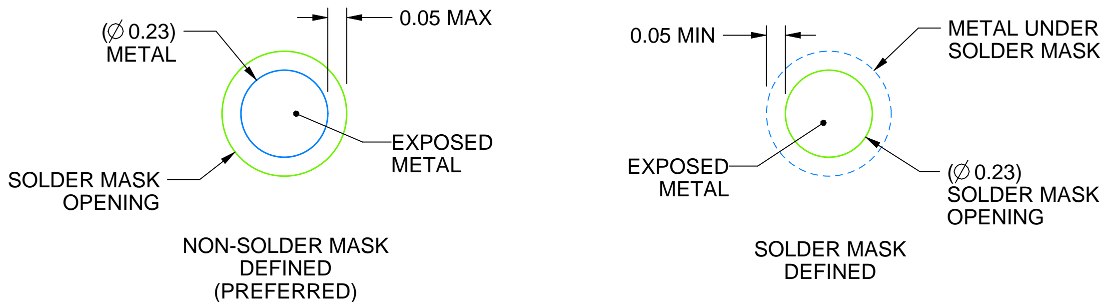


NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:30X



NON-SOLDER MASK
DEFINED
(PREFERRED)

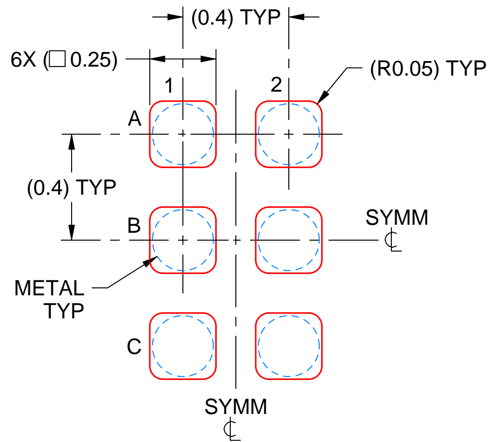
SOLDER MASK
DEFINED

SOLDER MASK DETAILS
NOT TO SCALE

4223785/A 06/2017

NOTES: (continued)

3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. For more information, see Texas Instruments literature number SNVA009 (www.ti.com/lit/snva009).



SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
SCALE:35X

4223785/A 06/2017

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.
