参考資料

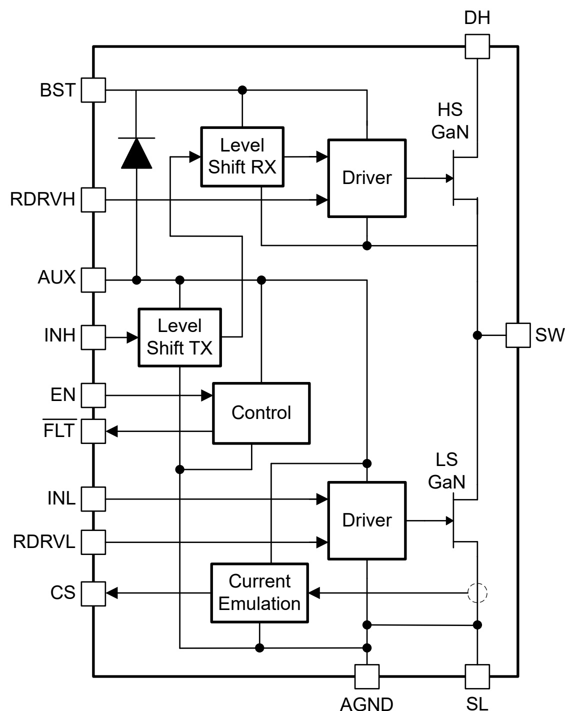
LMG2640 650V GaN を内蔵したハーフブリッジ

1 特長

- 650V GaN パワー FET ハーフブリッジ
- 105mΩ ローサイドおよびハイサイド GaN FET
- 伝搬遅延が小さく、内蔵ゲート ドライバ
- 広い帯域幅で高精度の電流検出エミュレーション
- ローサイド / ハイサイド ゲート ドライブ インターロック
- ハイサイド ゲート ドライブ信号レベル シフタ
- スマート スイッチ付きブートストラップ ダイオード機能
- ハイサイドの起動:8µs 未満
- ローサイド / ハイサイドのサイクルごとの過電流保護
- $\overline{\text{FLT}}$ ピン通知付きの過熱保護
- AUX アイドル静止電流:250µA
- AUX スタンバイ静止電流:50µA
- BST アイドル静止電流:65µA
- 電源および入力ロジック ピン最大電圧:26 V
- デュアル サーマル パッド付き 9mm × 7mm QFN パッケージ

2 アプリケーション

- AC/DC アダプタおよびチャージャ
- AC/DC USB 壁コンセント電源
- AC/DC 補助電源
- モバイル向け充電器の設計
- USB 電源コンセント



概略ブロック図

3 概要

LMG2640 は、スイッチ モード電源アプリケーション用 650V GaN パワー FET ハーフブリッジです。LMG2640 は、ハーフブリッジ パワー FET、ゲート ドライバ、ブートストラップ ダイオード、ハイサイド ゲート ドライブ レベル シフタを 9mm x 7mm の QFN パッケージに統合することで、設計の簡素化、部品点数の低減、基板面積の低減を実現しています。

ローサイド電流検出エミュレーションにより、従来の電流検出抵抗方式よりも消費電力を低減でき、またローサイドのサーマル パッドを冷却用 PCB 電源グランドに接続できます。

ハイサイド ゲート ドライブ信号レベル シフタにより、外付けソリューションに見られるノイズとバースト モード電力消費の問題を解消できます。スマート スイッチ付き GaN ブートストラップ FET は、ダイオードの順方向電圧降下がなく、ハイサイド電源の過充電を回避でき、逆方向回復電荷はゼロです。

LMG2640 は、小さい静止電流と高速な起動時間によって、コンバータの軽負荷効率要件とバースト モード動作に対応しています。保護機能には、FET ターンオン インターロック、低電圧誤動作防止 (UVLO)、サイクル単位の電流制限、過熱シャットダウンが含まれます。

パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ(2)
LMG2640	RRG (QFN、40)	9.00mm × 7.00mm

(1) 詳細については、「セクション 11」セクションを参照してください。
(2) パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

4 Pin Configuration and Functions

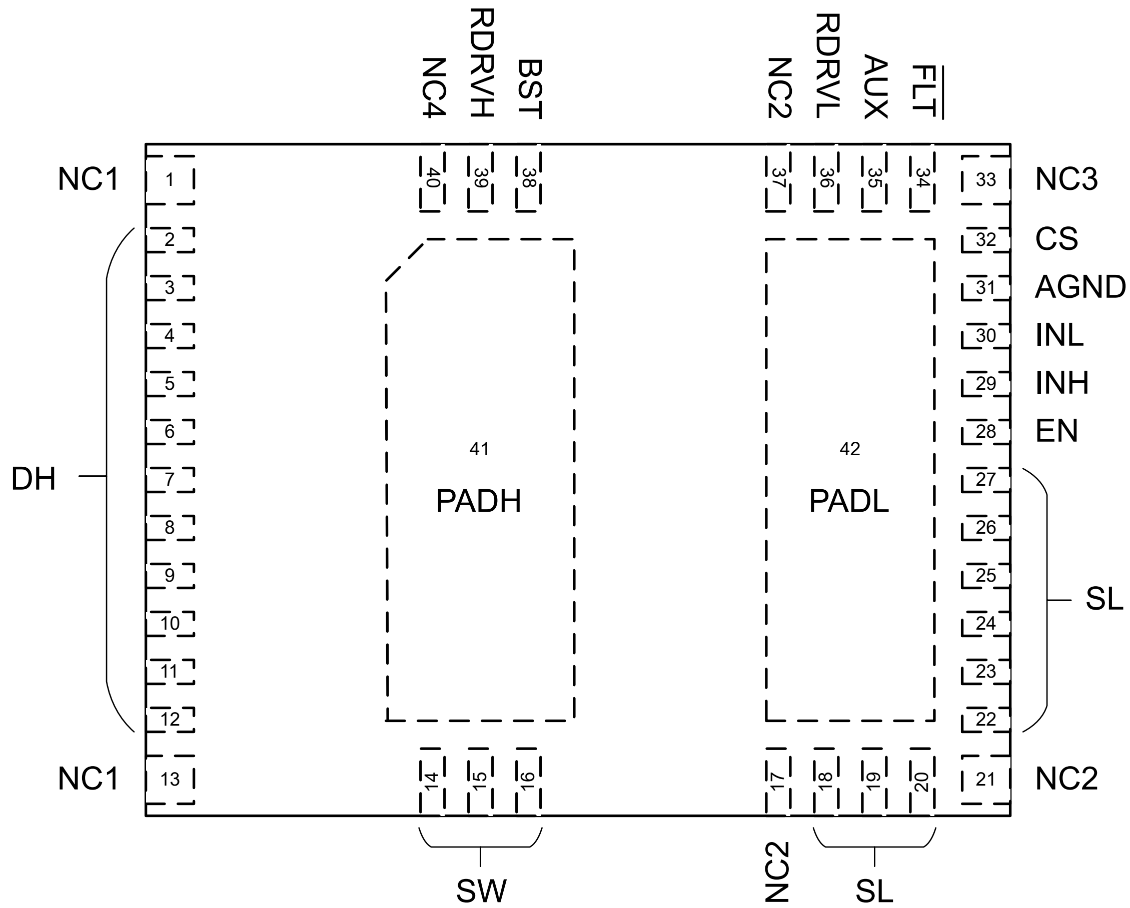

図 4-1. RRG Package, 40-Pin VQFN (Top View)

表 4-1. Pin Functions

PIN		TYPE[(1)]	DESCRIPTION
NAME	NO.		
NC1	1, 13	NC	Used to anchor QFN package to PCB. Pins must be soldered to PCB landing pads. The PCB landing pads are non-solder mask defined pads and must not be physically connected to any other metal on the PCB. Internally connected to DH.
DH	2–12	P	High-side GaN FET drain. Internally connected to NC1.
SW	14–16	P	GaN FET half-bridge switch node between the high-side GaN FET source and low-side GaN FET drain. Internally connected to PADH.
NC2	17, 21, 37	NC	Used to anchor QFN package to PCB. Pins must be soldered to PCB landing pads. The PCB landing pads are non-solder mask defined pads and must not be physically connected to any other metal on the PCB. Internally connected to AGND, SL, and PADL.
SL	18–20, 22–27	P	Low-side GaN FET source. Internally connected to AGND, PADL, and NC2.
EN	28	I	Enable. Used to toggle between active and standby modes. The standby mode has reduced quiescent current to support converter light load efficiency targets. There is a forward biased ESD diode from EN to AUX so avoid driving EN higher than AUX.
INH	29	I	High-side gate-drive control input. Referenced to AGND. Signal is level shifted internally to the high-side GaN FET driver. There is a forward biased ESD diode from INH to AUX so avoid driving INH higher than AUX.
INL	30	I	Low-side gate-drive control input. Referenced to AGND. There is a forward biased ESD diode from INL to AUX so avoid driving INL higher than AUX.
AGND	31	GND	Low-side analog ground. Internally connected to SL, PADL, and NC2.
CS	32	O	Current-sense emulation output. Outputs 0.616 ma/A scaled replica of the low-side GaN FET current. Feed output current into a resistor to create a current sense voltage signal. Reference the resistor to the power supply controller IC local ground. This function replaces the external current-sense resistor that is used in series with the low-side FET.
NC3	33	NC	Used to anchor QFN package to PCB. Pin must be soldered to a PCB landing pad. The PCB landing pad is non-solder mask defined pad and must not be physically connected to any other metal on the PCB. Pin not connected internally.
$\overline{FLT}$	34	O	Active-low fault output. Open-drain output that asserts during an over-temperature shutdown.
AUX	35	P	Auxiliary voltage rail. Low-side supply voltage. Connect a local bypass capacitor between AUX and AGND.
RDRVL	36	I	Short to AGND.
BST	38	P	Bootstrap voltage rail. High-side supply voltage. The bootstrap diode function between AUX and BST is internally provided. Connect an appropriately sized bootstrap capacitor between BST and SW. Recommend to make the SW connection using NC4 as a pass through connection to PADH (PADH = SW) as explained in the NC4 description.
RDRVH	39	I	Short to SW.Recommend to make the SW connection using NC4 as a pass through connection to PADH (PADH = SW) as explained in the NC4 description.
NC4	40	NC	Pin is not functional. Pin is high impedance and referenced to SW. Recommend to connect pin to PADH (PADH = SW) to use as convenient connection for the BST bypass capacitor and the RDRVH. See the example board layout in the *Layout Example* section.
PADH	41	TP	High-side thermal pad. Internally connected to SW. All the SW current can be conducted with PADH (PADH = SW).
PADL	42	TP	Low-side thermal pad. Internally connected to SL, AGND, and NC2. All the SL current can be conducted with PADL (PADL = SL).

(1) I = Input, O = Output, G = Ground, P = Power, NC = No Connect, TP = Thermal Pad.

5 Specifications

5.1 Absolute Maximum Ratings

Unless otherwise noted: voltages are respect to AGND[(1)]

			MIN	MAX	UNIT
$V_{DS(ls)}$	Low-side drain-source (SW to SL) voltage, FET off			650	V
$V_{DS(surge)(ls)}$	Low-side drain-source (SW to SL) voltage, surge condition, FET off [(2)]			720	V
$V_{DS(tr)(surge)(ls)}$	Low-side drain-source (SW to SL) transient ringing peak voltage, surge condition, FET off [(2)]			800	V
$V_{DS(hs)}$	High-side drain source (DH to SW) voltage, FET off			650	V
$V_{DS(surge)(hs)}$	High-side drain-source (DH to SW) voltage, surge condition, FET off [(2)]			720	V
$V_{DS(tr)(surge)(hs)}$	High-side drain-source (DH to SW) transient ringing peak voltage, surge condition, FET off [(2)]			800	V
	Pin voltage	AUX	–0.3	30	V
		EN, INL, INH, $\overline{FLT}$	–0.3	V_{AUX} + 0.3	V
		CS	–0.3	5.5	V
		RDRVL	–0.3	4	V
	Pin voltage to SW	BST	–0.3	30	V
		RDRVH	–0.3	4	V
$I_{D(cnts)(ls)}$	Low-side drain (SW to SL) continuous current, FET on		–10	Internally limited	A
$I_{S(cnts)(ls)}$	Low-side source (SL to SW) continuous current, FET off			10	A
$I_{D(cnts)(hs)}$	High-side drain (DH to SW) continuous current, FET on		–10	Internally limited	A
$I_{S(cnts)(hs)}$	High-side source (SW to DH) continuous current, FET off			10	A
	Positive sink current	CS		10	mA
		$\overline{FLT}$ (while asserted)		Internally limited	mA
T_J	Operating junction temperature		–40	150	°C
T_{stg}	Storage temperature		–65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) See セクション 7.3.1 for more information on the GaN power FET switching capability.

5.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[(1)]	Pins 1 through 16, Pins 38 through 40	±1000	V
			Pins 17 through 37	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002[(2)]		±500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

Unless otherwise noted: voltages are respect to AGND

			MIN	NOM	MAX	UNIT
	Supply voltage	AUX	10		26	V
	Supply voltage to SW	BST	7.5		26	V
	Input voltage	EN, INL, INH	0		V_{AUX}	V
	Pull-up voltage on open-drain output	$\overline{FLT}$	0		V_{AUX}	V
V_{IH}	High-level input voltage	EN, INL, INH	2.5			V
V_{IL}	Low-level input voltage				0.6	V
$I_{D(cnts)(ls)}$	Low-side drain (SW to SL) continuous current, FET on		–8.2		8.2	A
$I_{D(cnts)(hs)}$	High-side drain (DH to SW) continuous current, FET on		–8.2		8.2	A
C_{AUX}	AUX to AGND capacitance from external bypass capacitor		3 x C_{BST}			µF
C_{BST_SW}	BST to SW capacitance from external bypass capacitor		0.010			µF

5.4 Thermal Information

THERMAL METRIC[1]		LMG2640	UNIT
		RRG (VQFN)	
		40 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	22.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.21	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

5.5 Electrical Characteristics

1) Symbol definitions: $V_{DS(ls)}$ = SW to SL voltage; $I_{DS(ls)}$ = SW to SL current; $V_{DS(hs)}$ = DH to SW voltage; $I_{D(hs)}$ = DH to SW current; 2) Unless otherwise noted: voltage, resistance, and capacitance are respect to AGND; –40°C ≤ T_J ≤ 125°C; 10V ≤ V_{AUX} ≤ 26V; 7.5V ≤ V_{BST_SW} ≤ 26V; V_{EN} = 5V; V_{INL} = 0V; V_{INH} = 0V; R_{CS} = 100Ω

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
LOW-SIDE GAN POWER FET						
$R_{DS(on)(ls)}$	Drain-source (SW to SL) on resistance	V_{INL} = 5V, $I_{D(ls)}$ = 4.8A, T_J = 25°C		105		mΩ
		V_{INL} = 5V, $I_{D(ls)}$ = 4.8A, T_J = 125°C		200		
$I_{DSS(ls)}$	Drain (SW to SL) leakage current	$V_{DS(hs)}$ = 0V, $V_{DS(ls)}$ = 650V, T_J = 25°C		3.1		µA
		$V_{DS(hs)}$ = 0V, $V_{DS(ls)}$ = 650V, T_J = 125°C		15.4		
$Q_{OSS(ls)}$	Output (SW to SL) charge	$V_{DS(hs)}$ = 0V, $V_{DS(ls)}$ = 400V		33.6		nC
$C_{OSS(ls)}$	Output (SW to SL) capacitance			51.0		pF
$E_{OSS(ls)}$	Output (SW to SL) capacitance stored energy			4.64		µJ
$C_{OSS,er(ls)}$	Energy related effective output (SW to SL) capacitance			58.0		pF
$C_{OSS,tr(ls)}$	Time related effective output (SW to SL) capacitance	$V_{DS(hs)}$ = 0V, $V_{DS(ls)}$ = 0V to 400V		84.0		pF
$Q_{RR(ls)}$	Reverse recovery charge			0		nC
HIGH-SIDE GAN POWER FET						
$R_{DS(on)(hs)}$	Drain-source (DH to SW) on resistance	V_{INH} = 5V, $I_{D(hs)}$ = 4.8A, T_J = 25°C		105		mΩ
		V_{INH} = 5V, $I_{D(hs)}$ = 4.8A, T_J = 125°C		200		
$I_{DSS(hs)}$	Drain (DH to SW) leakage current	$V_{DS(ls)}$ = 0V, $V_{DS(hs)}$ = 650V, T_J = 25°C		3.1		µA
		$V_{DS(ls)}$ = 0V, $V_{DS(hs)}$ = 650V, T_J = 125°C		15.4		
$Q_{OSS(hs)}$	Output (DH to SW) charge	$V_{DS(ls)}$ = 0V, $V_{DS(hs)}$ = 400V		33.6		nC
$C_{OSS(hs)}$	Output (DH to SW) capacitance			51.0		pF
$E_{OSS(hs)}$	Output (DH to SW) capacitance stored energy			4.64		µJ
$C_{OSS,er(hs)}$	Energy related effective output (DH to SW) capacitance			58.0		pF
$C_{OSS,tr(hs)}$	Time related effective output (DH to SW) capacitance	$V_{DS(ls)}$ = 0V, $V_{DS(hs)}$ = 0V to 400V		84.0		pF
$Q_{RR(hs)}$	Reverse recovery charge			0		nC
LOW-SIDE OVERCURRENT PROTECTION						
$I_{T(OC)(ls)}$	Overcurrent fault – threshold current		8.2	9.1	10	A
HIGH-SIDE OVERCURRENT PROTECTION						
$I_{T(OC)(hs)}$	Overcurrent fault – threshold current		8.2	9.1	10	A
BOOTSTRAP RECTIFIER						
$R_{DS(on)}$	AUX to BST on resistance	V_{INL} = 5V, V_{AUX_BST} = 1V, T_J = 25°C		8		Ω
		V_{INL} = 5V, V_{AUX_BST} = 1V, T_J = 125°C		14		
	AUX to BST current limit	V_{INL} = 5V, V_{AUX_BST} = 7V	210	240	270	mA
	BST to AUX reverse current blocking threshold	V_{INL} = 5V		15		mA

5.5 Electrical Characteristics (続き)

1) Symbol definitions: $V_{DS(ls)}$ = SW to SL voltage; $I_{DS(ls)}$ = SW to SL current; $V_{DS(hs)}$ = DH to SW voltage; $I_{D(hs)}$ = DH to SW current; 2) Unless otherwise noted: voltage, resistance, and capacitance are respect to AGND; –40°C ≤ T_J ≤ 125°C; 10V ≤ V_{AUX} ≤ 26V; 7.5V ≤ V_{BST_SW} ≤ 26V; V_{EN} = 5V; V_{INL} = 0V; V_{INH} = 0V; R_{CS} = 100Ω

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
CS						
	Current sense gain ($I_{CS(src)}$ / $I_{D(LS)}$)	V_{INL} = 5V, 0V ≤ V_{CS} ≤ 2V, 0A ≤ $I_{D(ls)}$< $I_{T(OC)(ls)}$		0.616		mA/A
	Current sense input offset current	V_{INL} = 5V, 0V ≤ V_{CS} ≤ 2V, 0A ≤ $I_{D(ls)}$ < $I_{T(OC)(ls)}$	–82		82	mA
	Initial held output after overcurrent fault occurs while INL remains high	V_{INL} = 5V, 0V ≤ V_{CS} ≤ 2V			7	mA
$I_{CS(src)(OC)(final)}$	Final held output after overcurrent fault occurs while INL remains high	V_{INL} = 5V, 0V ≤ V_{CS} ≤ 2V	10	12	15.5	mA
	Output clamp voltage	V_{INL} = 5V, $I_{D(ls)}$ = 8.1A, CS sinking 5mA from external source		2.5		V
EN, INL, INH						
V_{IT+}	Positive-going input threshold voltage		1.7		2.45	V
$V_{IT–}$	Negative-going input threshold voltage		0.7		1.3	V
	Input threshold voltage hysteresis			1		V
	Pull-down input resistance	0V ≤ V_{PIN} ≤ 3V	200	400	600	kΩ
	Pull-down input current	10V ≤ V_{PIN} ≤ 26V; V_{AUX} = 26V		10		µA
OVER-TEMPERATURE PROTECTION						
	Temperature fault – postive-going threshold temperature			150		°C
	Temperature fault – negative-going threshold temperature			130		°C
	Temperature fault – threshold temperature hysteresis			20		°C
$\overline{FLT}$						
	Low-level output voltage	$\overline{FLT}$ sinking 1mA while asserted			200	mV
	Off-state sink current	$V_{\overline{FLT}}$ = V_{AUX} while de-asserted			1	µA
AUX						
$V_{AUX,T+(UVLO)}$	UVLO – positive-going threshold voltage		8.9	9.3	9.7	V
	UVLO – negative-going threshold voltage		8.6	9.0	9.4	V
	UVLO – threshold voltage hysteresis			250		mV
	Standby quiescent current	V_{EN} = 0V		50	80	µA
	Quiescent current			250	370	µA
	Quiescent current	V_{INL} = 5V, $I_{D(ls)}$ = 0A		1250		µA
	Operating current	V_{INL} = 0V or 5V, $V_{DS(ls)}$ = 0V, $I_{D(ls)}$ = 0A, f_{INL} = 500kHz		3.5		mA
BST						
$V_{BST_SW,T+(UVLO)}$	V_{BST_SW} UVLO for FET to turn on – positive-going threshold voltage		6.7	7	7.3	V
	V_{BST_SW} UVLO for FET to stay on– negative-going threshold voltage		4.8	5.1	5.4	V
	Quiescent current			65	100	µA
	Quiescent current	V_{INH} = 5V		350		µA

6 Parameter Measurement Information

6.1 GaN Power FET Switching Parameters

図 6-1 shows the circuit used to measure the GaN power FET switching parameters. The circuit is operated as a double-pulse tester. Consult external references for double-pulse tester details. The circuit is placed in the boost configuration to measure the low-side GaN switching parameters. The circuit is placed in the buck configuration to measure the high-side GaN switching parameters. The GaN FET not being measured in each configuration (high-side in the boost and low-side in the buck) acts as the double-pulse tester diode and circulates the inductor current in the off-state, third-quadrant conduction mode. 表 6-1 shows the details for each configuration.

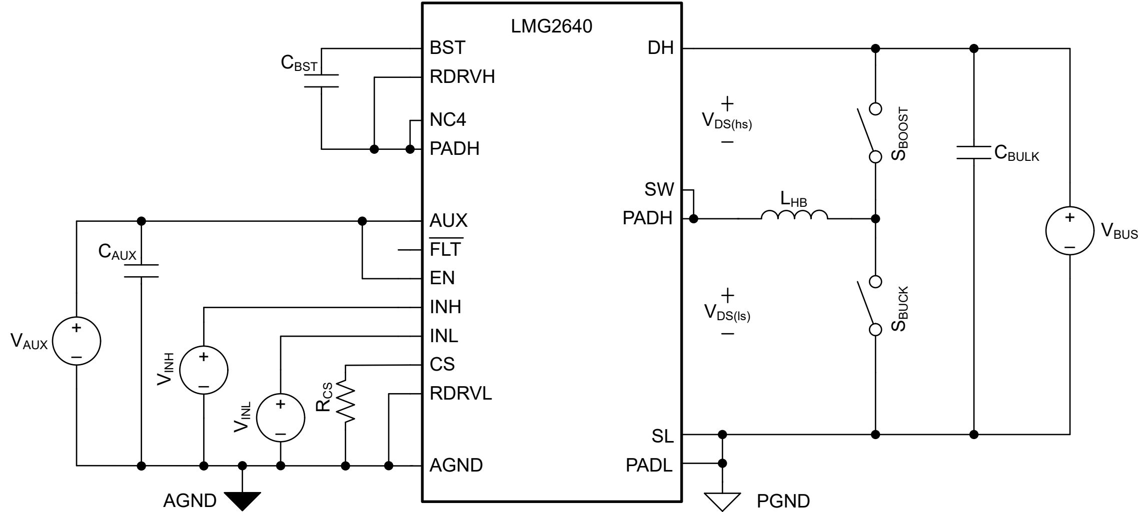

図 6-1. GaN Power FET Switching Parameters Test Circuit

表 6-1. GaN Power FET Switching Parameters Test Circuit Configuration Details

Configuration	GaN FET Under Test	GaN FET Acting as Diode	S_{BOOST}	S_{BUCK}	V_{INL}	V_{INH}
Boost	Low-side	High-side	Closed	Open	Double-pulse waveform	0V
Buck	High-side	Low-side	Open	Closed	0V	Double-pulse waveform

図 6-2 shows the GaN power FET switching parameters.

The GaN power FET turn-on transition has three timing components: drain-current turn-on delay time, turn-on delay time, and turn-on rise time. Note that the turn-on rise time is the same as the V_{DS} 80% to 20% fall time.

The GaN power FET turn-off transition has two timing components: turn-off delay time, and turn-off fall time. Note that the turn-off fall time is the same as the V_{DS} 20% to 80% rise time. The turn-off timing components are heavily dependent on the L_{HB} current.

The turn-on slew rate is measured over a smaller voltage delta (100V) compared to the turn-on rise time voltage delta (240V) to obtain a faster slew rate which is useful for EMI design.

図 6-2. GaN Power FET Switching Parameters

7 Detailed Description

7.1 Overview

The LMG2640 is a highly-integrated 650V GaN power-FET half bridge. The LMG2640 combines the half-bridge power FETs, gate drivers, low-side current-sense emulation function, high-side gate-drive level shifter, and bootstrap diode function in a 9mm by 7mm QFN package.

The GaN half-bridge consists of 105mΩ low-side FET and high-side FETs.

The LMG2640 internal gate drivers regulate the drive voltage for optimum GaN power-FET on-resistance. Internal drivers also reduce total gate inductance and GaN FET common-source inductance for improved switching performance, including common-mode transient immunity (CMTI).

Current-sense emulation places a scaled replica of the low-side drain current on the output of the CS pin. The CS pin is terminated with a resistor to AGND to create the current-sense input signal to the external power supply controller. This CS pin resistor replaces the traditional current-sense resistor, placed in series with the low-side GaN FET source, at significant power and space savings. Furthermore, with no current-sense resistor in series with the GaN source, the low-side GaN FET thermal pad can be connected directly to the PCB power ground. This thermal pad connection both improves system thermal performance and provides additional device routing flexibility since full device current can be conducted through the thermal pads.

The high-side gate-drive level-shifter reduces the capacitive coupling of the sensitive high-side gate drive path for lower noise susceptibility and better CMTI compared to external solutions where the signal path has a much larger PCB footprint. The level shifter also has minimal impact on device quiescent current and no impact on device start-up time compared to external solutions with worse quiescent current and start up performance.

The bootstrap diode function between AUX and BST is implemented with a smart-switched GaN bootstrap FET. The switched GaN bootstrap FET allows more complete charging of the BST-to-SW capacitor since the on-state GaN bootstrap FET does not have the forward voltage drop of a traditional bootstrap diode. The smart-switched GaN bootstrap FET also avoids the traditional bootstrap diode problem of BST-to-SW capacitor overcharging due to off-state third-quadrant current flow in the low-side half-bridge GaN power FET. Finally, the bootstrap function has more efficient switching due to low capacitance and no reverse-recovery charge compared to the traditional bootstrap diode.

The AUX input supply wide voltage range is compatible with the corresponding wide range supply rail created by power supply controllers. The BST input supply range is even wider on the low end to account for capacitive droop in between bootstrap recharge cycles. Low AUX / BST idle quiescent currents and fast BST start-up time support converter burst-mode operation critical for meeting government light-load efficiency mandates. Further AUX quiescent current reduction is obtained by placing the device in standby mode with the EN pin.

The INL, INH, and EN control pins have high input impedance, low input threshold voltage and maximum input voltage equal to the AUX voltage. This allows the pins to support both low voltage and high voltage input signals and be driven with low-power outputs.

The LMG2640 protection features are low-side / high-side under-voltage lockout (UVLO), low-side / high-side input gate-drive interlock, low-side / high-side cycle-by-cycle current limit, and over-temperature shut down. The UVLO features also help achieve well-behaved converter operation. The over-temperature shut down is reported on the open drain $\overline{FLT}$ output.

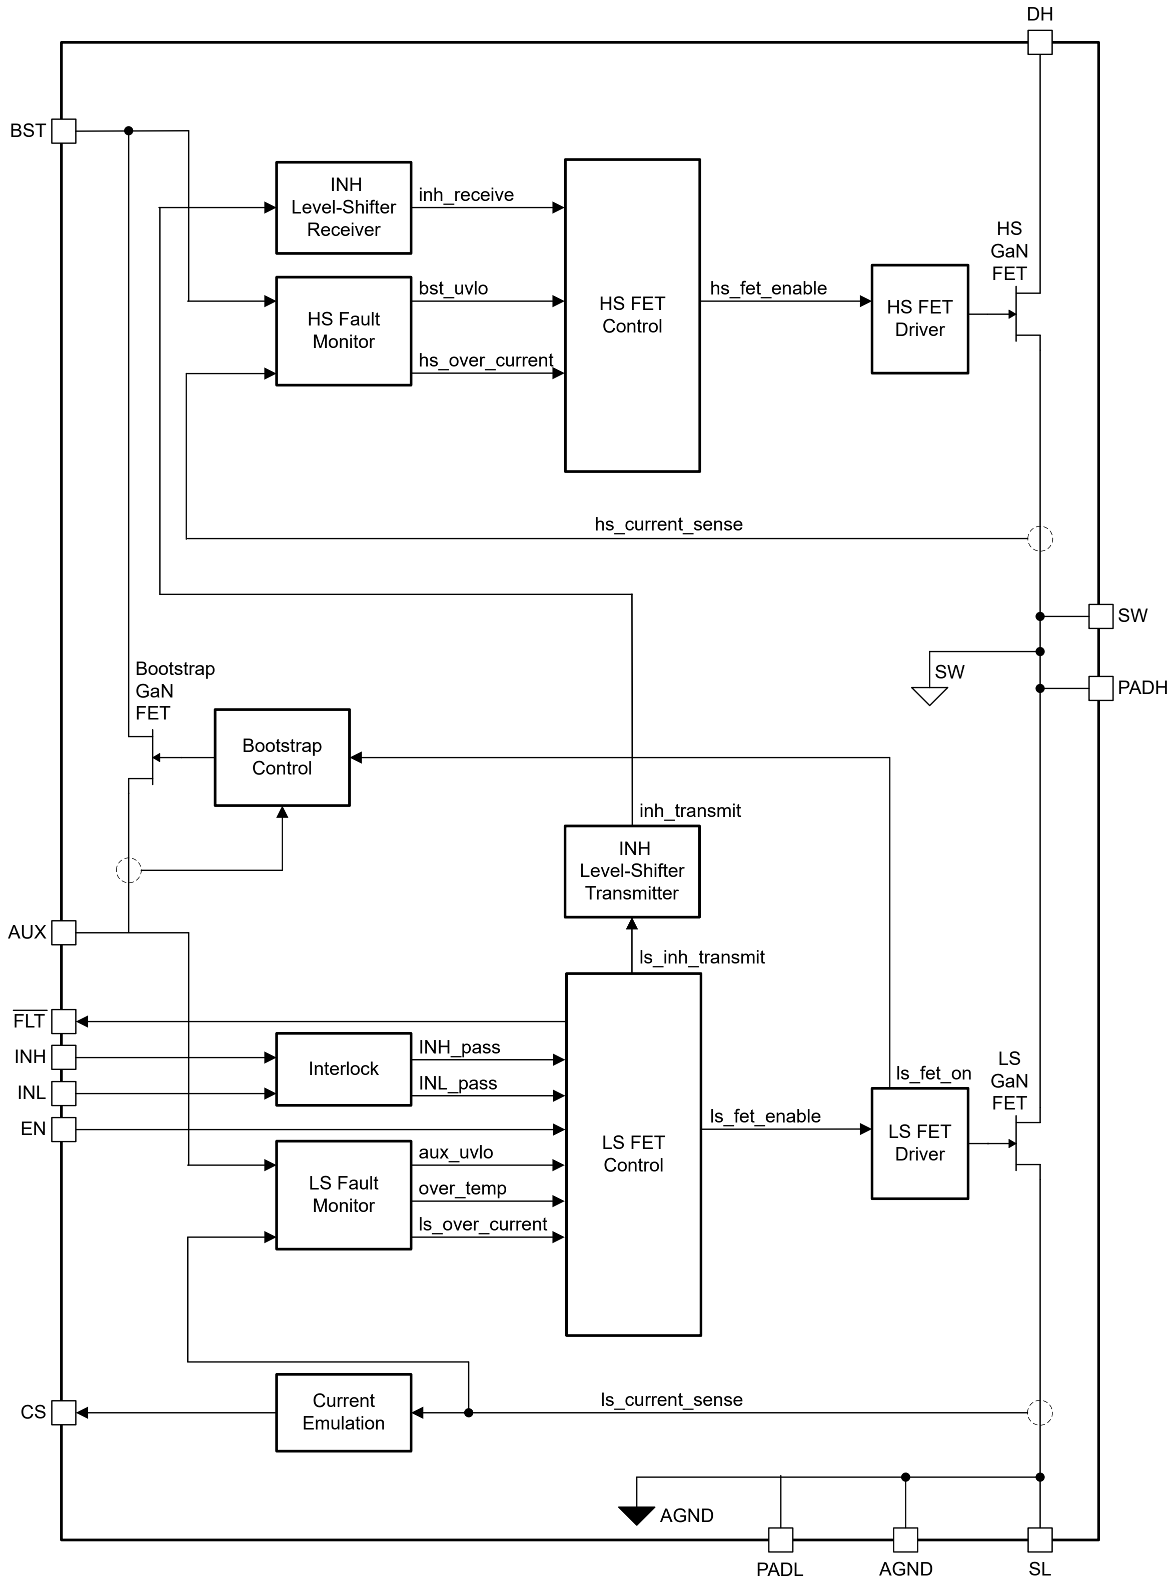
7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 GaN Power FET Switching Capability

Due to the silicon FET's long reign as the dominant power-switch technology, many designers are unaware that the nameplate drain-source voltage cannot be used as an equivalent point to compare devices across technologies. The nameplate drain-source voltage of a silicon FET is set by the avalanche breakdown voltage. The nameplate drain-source voltage of a GaN FET is set by the long term compliance to data sheet specifications.

Exceeding the nameplate drain-source voltage of a silicon FET can lead to immediate and permanent damage. Meanwhile, the breakdown voltage of a GaN FET is much higher than the nameplate drain-source voltage. For example, the breakdown drain-source voltage of the LMG2640 GaN power FET is more than 800V which allows the LMG2640 to operate at conditions beyond an identically nameplate rated silicon FET.

The LMG2640 GaN power FET switching capability is explained with the assistance of 図 7-1. The figure shows the drain-source voltage versus time for the LMG2640 GaN power FET for four distinct switch cycles in a switching application. No claim is made about the switching frequency or duty cycle. The first two cycles show normal operation and the second two cycles show operation during a rare input voltage surge. The LMG2640 GaN power FETs are intended to be turned on in either zero-voltage switching (ZVS) or discontinuous-conduction mode (DCM) switching conditions.

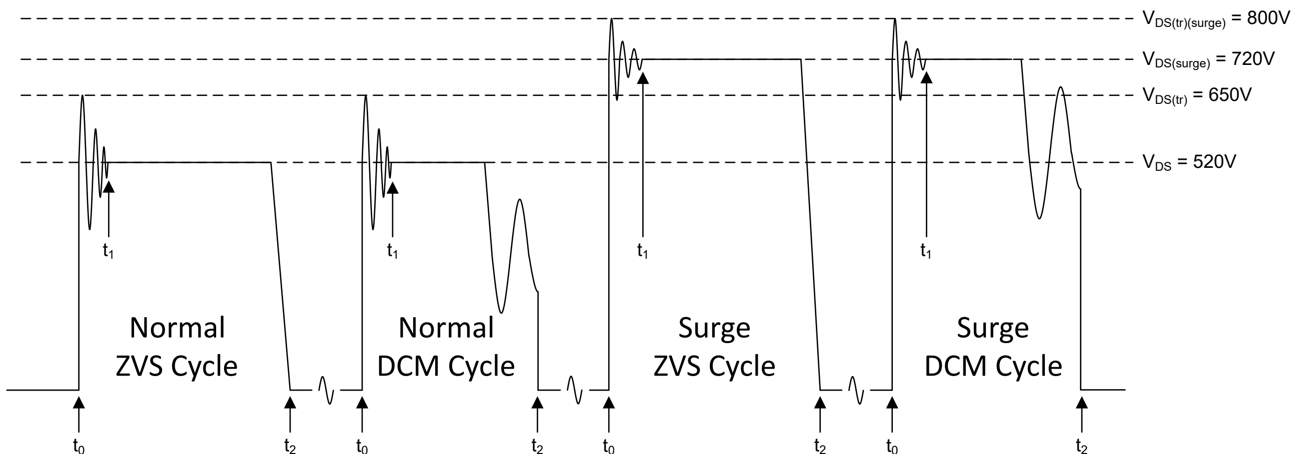


図 7-1. GaN Power FET Switching Capability

Each cycle starts before t_0 with the FET in the on state. At t_0 the GaN FET turns off and parasitic elements cause the drain-source voltage to ring at a high frequency. The high frequency ringing has damped out by t_1. Between t_1 and t_2 the FET drain-source voltage is set by the characteristic response of the switching application. The characteristic is shown as a flat line (plateau), but other responses are possible. At t_2 the GaN FET is turned on. For normal operation, the transient ring voltage is limited to 650V and the plateau voltage is limited to 520V. For rare surge events, the transient ring voltage is limited to 800V and the plateau voltage is limited to 720V.

Copyright © 2025 Texas Instruments Incorporated

7.3.2 Current-Sense Emulation

The current-sense emulation function creates a scaled replica of the low-side GaN power FET positive drain current at the output of the CS pin. The current-sense emulation gain, G_{CSE}, is 0.616mA output from the CS pin, I_{CS} for every 1A passing into the drain of the low-side GaN power FET, I_D.

$$G_{CSE} = I_{CS} / I_D = 0.616mA / 1A = 0.000616 \quad (1)$$

The CS pin is terminated with a resistor to AGND, R_{CS}, to create the current-sense voltage input signal to the external power supply controller.

R_{CS} is determined by solving for the traditional current-sense design resistance, $R_{CS(trad)}$, and multiplying by the inverse of G_{CSE}. The traditional current-sense design creates the current-sense voltage, $V_{CS(trad)}$, by passing the low-side GaN power FET drain current, I_D, through $R_{CS(trad)}$. The LMG2640 creates the current-sense voltage, V_{CS}, by passing the CS pin output current, I_{CS}, through R_{CS}. The current-sense voltage must be the same for both designs.

$$V_{CS} = I_{CS} \times R_{CS} = V_{CS(trad)} = I_D \times R_{CS(trad)} \quad (2)$$

$$R_{CS} = I_D / I_{CS} \times R_{CS(trad)} = 1 / G_{CSE} \times R_{CS(trad)} \quad (3)$$

$$R_{CS} = 1{,}623 \times R_{CS(trad)} \quad (4)$$

The CS pin is clamped internally to a typical 2.5V. The clamp protects vulnerable power-supply controller current-sense input pins from over voltage if, for example, the current sense resistor on the CS pin were to become disconnected.

図 7-2 shows the current-sense emulation operation. In both cycles, the CS pin current emulates the low-side GaN power-FET drain current while the low-side FET is enabled. The first cycle shows normal operation where the controller turns off the low-side GaN power FET when the controller current-sense input threshold is tripped. The second cycle shows a fault situation where the LMG2640 *Overcurrent Protection* turns off the low-side GaN power FET before the controller current-sense input threshold is tripped. In this second cycle, the LMG2640 avoids a hung controller INL pulse by generating a fast-ramping artificial current-sense emulation signal to trip the controller current-sense input threshold. The artificial signal persists until the INL pin goes to logic-low which indicates the controller is back in control of switch operation.

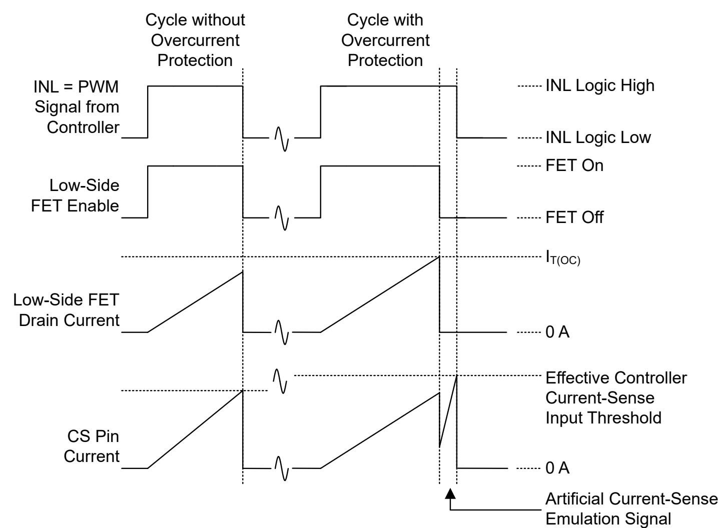

図 7-2. Current-Sense Emulation Operation

7.3.3 Bootstrap Diode Function

The internal bootstrap diode function is implemented with a smart-switched GaN bootstrap FET. The GaN bootstrap FET blocks current in both directions between AUX and BST when The GaN bootstrap FET is turned off.

The bootstrap diode function is active when the low-side GaN power FET is turned on and inactive when the low-side GaN power FET is turned off. The GaN bootstrap FET is held off in the bootstrap diode inactive phase. The GaN bootstrap FET is turned on a single time at the beginning of the bootstrap active phase and is controlled as an ideal diode with diode current flowing from AUX to BST to charge the BST-to-SW capacitor. If a small reverse current from BST to AUX is detected after the GaN bootstrap FET is turned on, the GaN bootstrap FET is turned off for the remainder of the bootstrap active phase.

The bootstrap diode function implements a current limit to protect the GaN bootstrap FET when the BST-to-SW capacitor is significantly discharged at the beginning of the bootstrap active phase. If there is no current limit situation during the GaN bootstrap FET turn on, or if the bootstrap function drops out of current limit as the BST-to-SW capacitor charges, the current limit function is disabled for the remainder of the GaN bootstrap FET turn-on time. The current limit function is disabled to save quiescent current.

7.3.4 Input Control Pins (EN, INL, INH)

The EN pin is used to toggle the device between the active and standby modes described in *Device Functional Modes*.

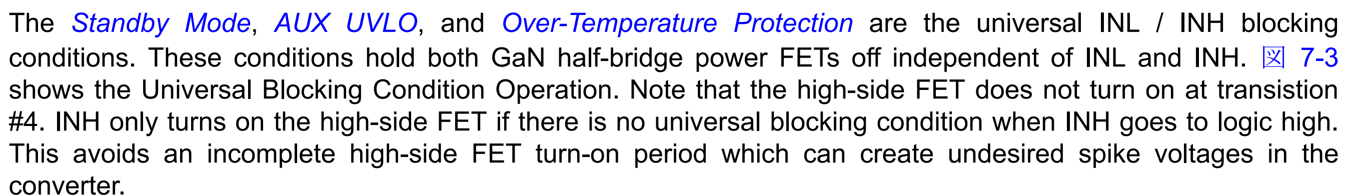
The INL pin is used to turn the low-side GaN power FET on and off.

The INH pin is used to turn the high-side GaN power FET on and off.

The input control pins have a typical 1V input-voltage-threshold hysteresis for noise immunity. The pins also have a typical 400kΩ pull-down resistance to protect against floating inputs. The 400kΩ saturates for typical input voltages above 4V to limit the maximum input pull-down current to a typical 10uA.

The INL turn-on action is impacted by the following conditions 1) *Standby Mode*, 2) *AUX UVLO*, 3) INH in control of *Interlock*, 4) Low-Side *Over-Current Protection*, and 5) *Over-Temperature Protection*.

The INH turn-on action is impacted by the following conditions 1) *Standby Mode*, 2) *AUX UVLO*, 3) INL in control of *Interlock*, 4) High-Side *Over-Current Protection*, and 5) *Over-Temperature Protection*.



The *Standby Mode*, *AUX UVLO*, and *Over-Temperature Protection* are the universal INL / INH blocking conditions. These conditions hold both GaN half-bridge power FETs off independent of INL and INH. 図 7-3 shows the Universal Blocking Condition Operation. Note that the high-side FET does not turn on at transistion #4. INH only turns on the high-side FET if there is no universal blocking condition when INH goes to logic high. This avoids an incomplete high-side FET turn-on period which can create undesired spike voltages in the converter.

Copyright © 2025 Texas Instruments Incorporated

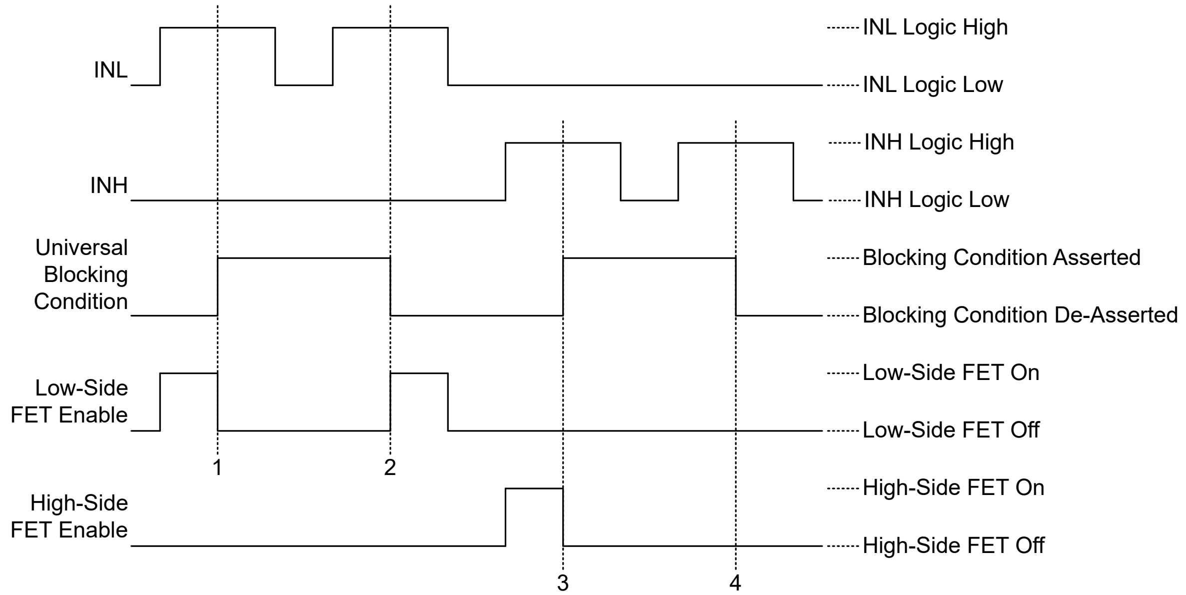


図 7-3. Universal INL / INH Blocking Condition Operation

7.3.5 INL - INH Interlock

The interlock function keeps the low-side and high-side GaN power FETs from being simultaneously turned on when the INL and INH pins are both logic-high. Either the INL or the INH pin gains control of the interlock if it is logic high when the other pin is logic low. Once the INL or INH pin gains control of the interlock, it retains control as long as it remains logic high. Only the INL or INH pin in control of the interlock passes a logic-high signal through the interlock.

The interlock is disabled if any of the universal INL / INH blocking conditions defined in *Input Control Pins* are asserted. When the interlock is disabled, the interlock outputs are held at logic low. If both INL and INH are logic-high when the interlock is enabled, the INL takes priority, gains control of the interlock, and passes the INL logic-high signal through the interlock.

7.3.6 AUX Supply Pin

The AUX pin is the input supply for the low-side internal circuits and is the power source to charge the BST-to-SW capacitor through the internal bootstrap diode function.

7.3.6.1 AUX Power-On Reset

The AUX Power-On Reset disables all low-side functionality if the AUX voltage is below the AUX Power-On Reset voltage. The AUX Power-On Reset voltage is not specified but is around 5V. The AUX Power-On Reset enables the over-temperature protection function if the AUX voltage is above the AUX Power-On Reset voltage.

7.3.6.2 AUX Under-Voltage Lockout (UVLO)

The AUX UVLO holds off both the low-side and high-side GaN power FETs if the AUX voltage is below the AUX UVLO voltage. The AUX UVLO voltage is set higher than the BST UVLO voltage so the high-side GaN power FET can be operated when the low-side GaN power FET is operating. The voltage separation between the AUX UVLO voltage and BST UVLO voltage accounts for operating conditions where the bootstrap charging of the BST-to-SW capacitor from the AUX supply is incomplete. The AUX UVLO voltage hysteresis prevents on-off chatter near the UVLO voltage trip point.

Copyright © 2025 Texas Instruments Incorporated

7.3.7 BST Supply Pin

The BST pin is the input supply for the high-side internal circuits. The BST pin and corresponding high-side circuits are referenced to the SW pin. The BST pin is powered by the low-side AUX Supply pin through the internal bootstrap diode function. The bootstrap function is inactive when the low-side GaN FET is off and the BST pin must rely on an external BST-to-SW capacitor for the BST power source.

Designing the BST-to-SW capacitance is a trade-off between high-side charge-up time and hold-up time. The BST-to-SW external capacitance is recommended to be a ceramic capacitor that is at least 10nF over operating conditions.

7.3.7.1 BST Power-On Reset

The BST Power-On Reset voltage is with respect to the SW pin. The BST Power-On Reset disables all high-side functionality if the BST-to-SW voltage is below the BST Power-On Reset voltage. The BST Power-On Reset voltage is not specified but is around 5V.

7.3.7.2 BST Under-Voltage Lockout (UVLO)

The BST UVLO voltage is with respect to the SW pin. The BST UVLO only controls the high-side GaN power FET. The BST UVLO does not control the low-side GaN power FET. The BST UVLO consists of two separate UVLO functions to create a two-level BST UVLO. The upper BST UVLO is called the BST Turn-On UVLO and only controls if the high-side GaN power FET is turned on. The lower BST UVLO is called the BST Turn-Off UVLO and only controls if the high-side GaN power FET is turned off after the high-side GaN power FET is turned on. The operation of the two-level UVLO is not the same as a single UVLO with wide hysteresis.

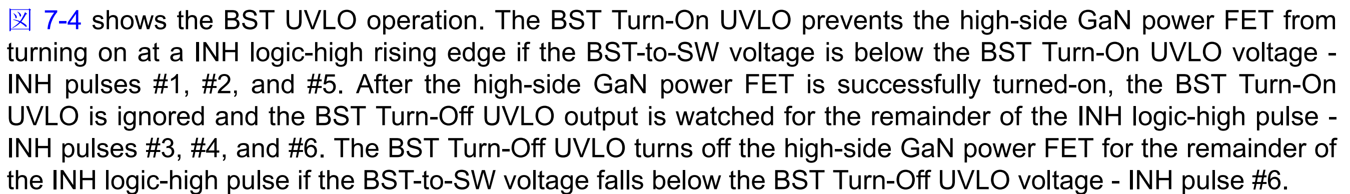

図 7-4 shows the BST UVLO operation. The BST Turn-On UVLO prevents the high-side GaN power FET from turning on at a INH logic-high rising edge if the BST-to-SW voltage is below the BST Turn-On UVLO voltage - INH pulses #1, #2, and #5. After the high-side GaN power FET is successfully turned-on, the BST Turn-On UVLO is ignored and the BST Turn-Off UVLO output is watched for the remainder of the INH logic-high pulse - INH pulses #3, #4, and #6. The BST Turn-Off UVLO turns off the high-side GaN power FET for the remainder of the INH logic-high pulse if the BST-to-SW voltage falls below the BST Turn-Off UVLO voltage - INH pulse #6.

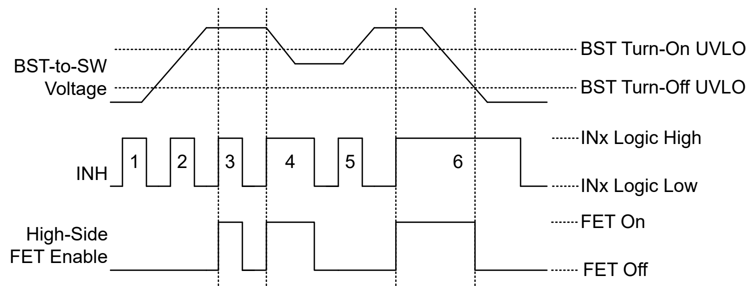

図 7-4. BST UVLO Operation

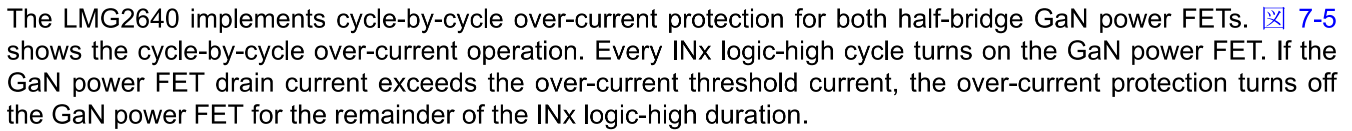
The effective voltage hysteresis of the two-level BST UVLO is the difference between the upper and lower BST UVLO voltages. A single-level BST UVLO can be implemented with the same hysteresis but allows subsequent high-side GaN power FET turn on anywhere in the hysteresis range. The two-level UVLO design prevents any turn on in the hysteresis range. A single-level BST UVLO would allow INH pulse #5 to turn on the high-side GaN power FET.

The two-level BST UVLO allows a wide hysteresis while making sure the BST-to-SW capacitor is adequately charged at the beginning of every INH pulse. The wide hysteresis allows a smaller BST-to-SW capacitor to be used which is useful for faster high-side start-up time. The adequate capacitor charge at the beginning of the INH pulse helps make sure the high-side GaN power FET is not turned-off early in the INH pulse which can create undesired spike voltages in the converter.

Copyright © 2025 Texas Instruments Incorporated

7.3.8 Over-Current Protection



The LMG2640 implements cycle-by-cycle over-current protection for both half-bridge GaN power FETs. 図 7-5 shows the cycle-by-cycle over-current operation. Every INx logic-high cycle turns on the GaN power FET. If the GaN power FET drain current exceeds the over-current threshold current, the over-current protection turns off the GaN power FET for the remainder of the INx logic-high duration.

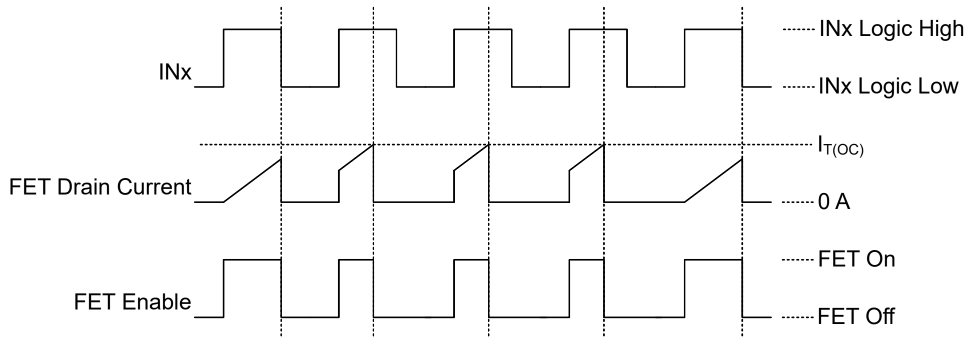


図 7-5. Cycle-by-Cycle Over-Current Protection Operation

An over-current protection event is not reported on the $\overline{\text{FLT}}$ pin. Cycle-by-cycle over-current protection minimizes system disruption because the event is not reported and because the protection allows the GaN power FET to turn on every INx cycle.

The low-side / high-side over-current protection threshold currents are set to different levels corresponding to the different GaN power FET sizes. As described in *Current-Sense Emulation*, an artificial CS pin current is produced after the low-side GaN power FET is turned off by the low-side over-current protection, to prevent the controller from entering a hung state.

7.3.9 Over-Temperature Protection

The over-temperature protection holds off both the low-side and high-side GaN power FETs if the LMG2640 temperature is above the over-temperature shut-down temperature. The over-temperature shut-down hysteresis avoids erratic thermal cycling. An over-temperature fault is reported on the $\overline{\text{FLT}}$ pin when the over-temperature protection is asserted. This is the only fault event reported on the $\overline{\text{FLT}}$ pin. The over-temperature protection is enabled when the AUX voltage is above the *AUX Power-On Reset* voltage. The low AUX Power-On Reset voltage helps the over-temperature protection remain operational when the AUX rail droops during the cool-down phase.

7.3.10 Fault Reporting

The LMG2640 only reports an over-temperature fault. An over-temperature fault is reported on the $\overline{\text{FLT}}$ pin when the *Over-Temperature Protection* function is asserted. The $\overline{\text{FLT}}$ pin is an active low open-drain output so the pin pulls low when there is an over-temperature fault.

7.4 Device Functional Modes

The LMG2640 has two modes of operation controlled by the EN pin. The device is in Active mode when the EN is logic high and in Standby mode when the EN pin is logic low. In active mode, the half-bridge GaN power FETs are controlled by the INL and INH pins. In Standby mode, the INL and INH pins are ignored, the half-bridge GaN power FETs are held off, and the AUX quiescent current is reduced to the AUX standby quiescent current.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The LMG2640 is a GaN power-FET half bridge with plug-and-play simplicity since it integrates the half-bridge FETs, FET gate drivers, high-side gate-drive level shifter, bootstrap diode function, and current-sense emulation in a single package. The integrated gate driver, low IN input threshold voltage, and wide AUX input-supply voltage allows the LMG2640 to seamlessly pair with common industry power-supply controllers.

8.2 Typical Application

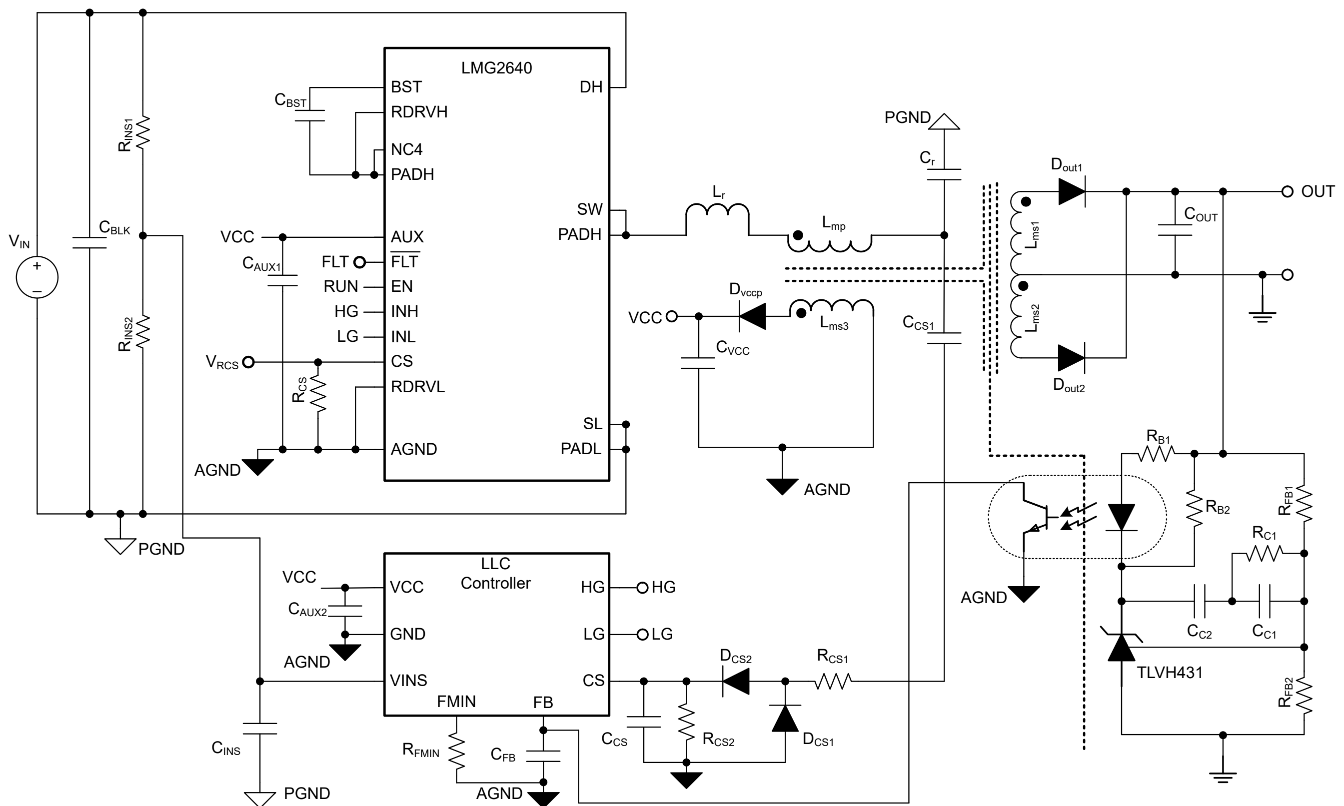

図 8-1. 280W LLC Converter Application

8.2.1 Design Requirements

表 8-1. Design Specification

SPECIFICATION	VALUE
Input DC voltage range	365 VDC to 410 VDC
Output DC voltage	12V
Ouput rated current	23.34A
Output voltage ripple at 390 VDC	120mVpp
Peak efficiency at 390 VDC	93%

Copyright © 2025 Texas Instruments Incorporated

8.2.2 Detailed Design Procedure

The typical application shows the LMG2640 pairing a LLC controller to create a high-power-density, high-efficiency, 280W, LLC converter. The 280W LLC converter application is adapted from the typical application. This detailed design procedure focuses on the specifics of using the LMG2640 in the application.

8.2.3 Application Curve

The following waveform shows typical switching waveforms. The red trace is the switch-node voltage of LMG2640, the green trace is the current-sense voltage across C_{CS}, and the blue trace is V_{OUT}.

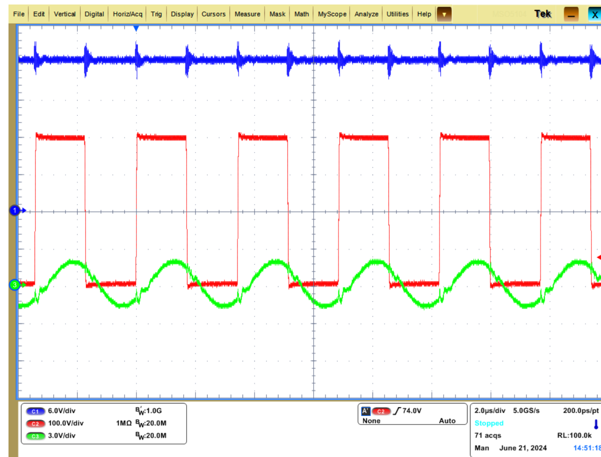

図 8-2. V_{IN} = 400VDC

8.3 Power Supply Recommendations

The LMG2640 operates from a single input supply connected to the AUX pin. The BST pin is powered internally by the AUX pin. The LMG2640 is intended to be operated from the same supply managed and used by the power supply controller. The wide recommended AUX voltage range of 10V to 26V overlaps common-controller supply-pin turn-on and UVLO voltage limits.

The BST-to-SW external capacitance is recommended to be a ceramic capacitor that is at least 10nF over operating conditions.

The AUX external capacitance is recommended to be a ceramic capacitor that is at least three-times larger than the BST-to-SW capacitance over operating conditions.

8.4 Layout

8.4.1 Layout Guidelines

8.4.1.1 Solder-Joint Stress Relief

Large QFN packages can experience high solder-joint stress. Several best practices are recommended to provide solder-joint stress relief. First, the instructions for the NC1, NC2, and NC3 anchor pins found in 表 4-1 must be followed. Second, all the board solder pads must be non-solder-mask defined (NSMD) as shown in the land pattern example in the *Mechanical Data*. Finally, any board trace connected to an NSMD pad must be less than 2/3 the width of the pad on the pad side where it is connected. The trace must maintain this 2/3 width limit for as long as it is not covered by solder mask. After the trace is under solder mask, there are no limits on the trace dimensions. All these recommendations are followed in the *Layout Example*.

8.4.1.2 Signal-Ground Connection

Design the power supply with separate signal and power grounds that only connect in one location. Connect the LMG2640 AGND pin to signal ground. Connect the LMG2640 SL pin and PADL thermal pad to power ground. The LMG2640 serves as the single connection point between the signal and power grounds since the AGND pin, SL pin, and PADL thermal pad are connected internally. Do not connect the signal and power grounds anywhere else on the board except as recommended in the next sentence. To facillitate board debug with the LMG2640 not installed, connect the AGND pad to the PADL thermal pad as shown in the *Layout Example*.

8.4.1.3 CS Pin Signal

As seen with 式 4, the current-sense signal impedance is three orders of magnitude higher than a traditional current-sense signal. This higher impedance has implications for current-sense signal noise susceptibility. Minimize routing the current-sense signal near any noisy traces. Place the current-sense resistor and any filtering capacitors at the far end of the trace next to the controller current-sense input pin.

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

9.1 Documentation Support

9.1.1 Related Documentation

For related documentation see the following:

LMG2640 Half-Bridge Daughter Card Evaluation Module

9.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。 変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

9.3 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの使用条件を参照してください。

9.4 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.
すべての商標は、それぞれの所有者に帰属します。

9.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

9.6 用語集

テキサス・インスツルメンツ用語集　　この用語集には、用語や略語の一覧および定義が記載されています。

10 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

DATE	REVISION	NOTES

11 Mechanical, Packaging, and Orderable Information

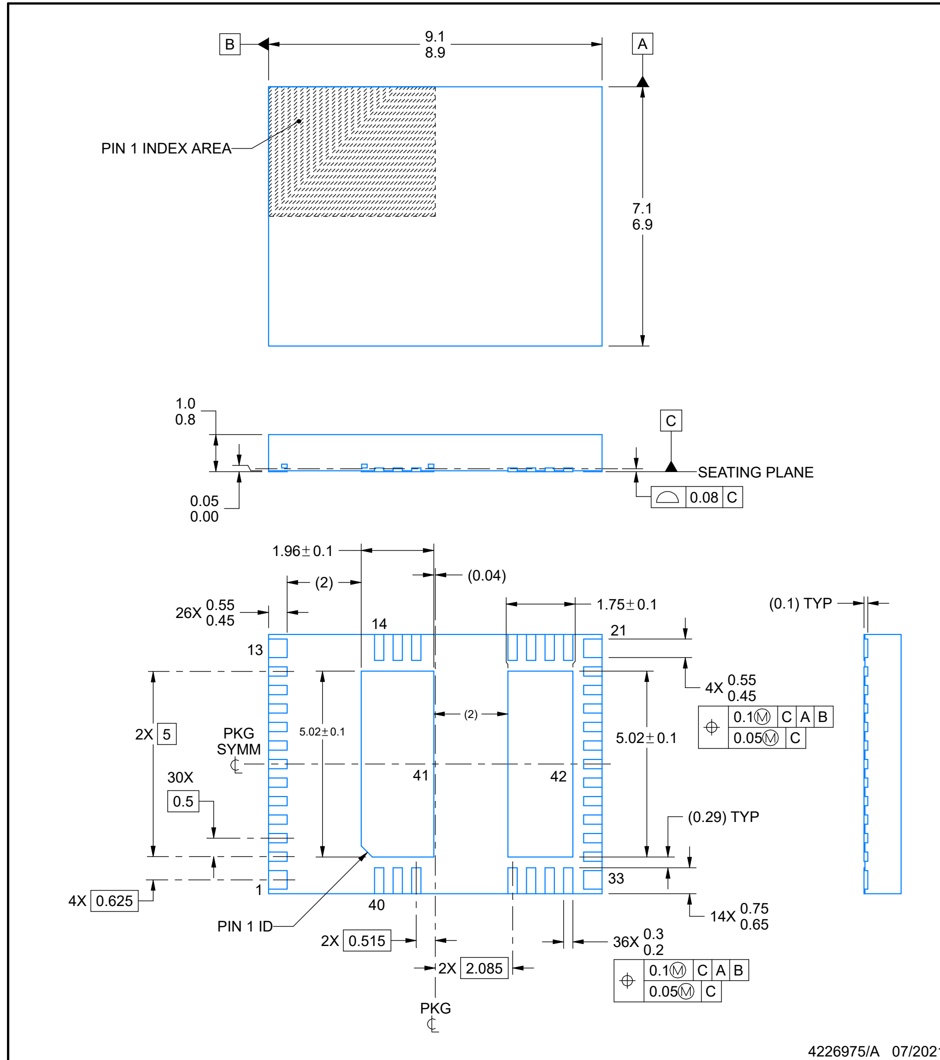
The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OUTLINE

RRG0040A-C01

VQFN - 1.0 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

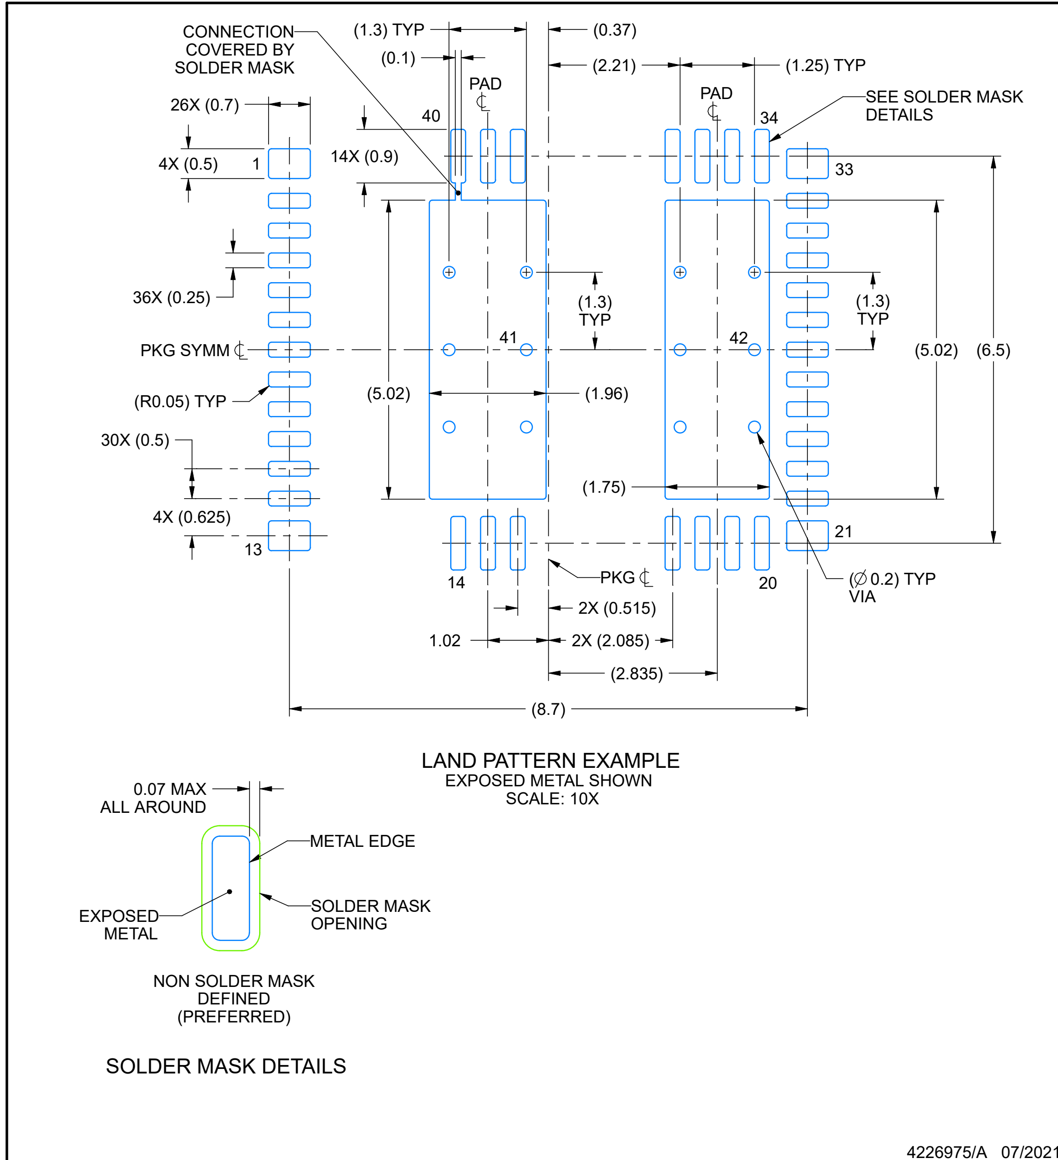
EXAMPLE BOARD LAYOUT

RRG0040A-C01 **VQFN - 1.0 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD



NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.

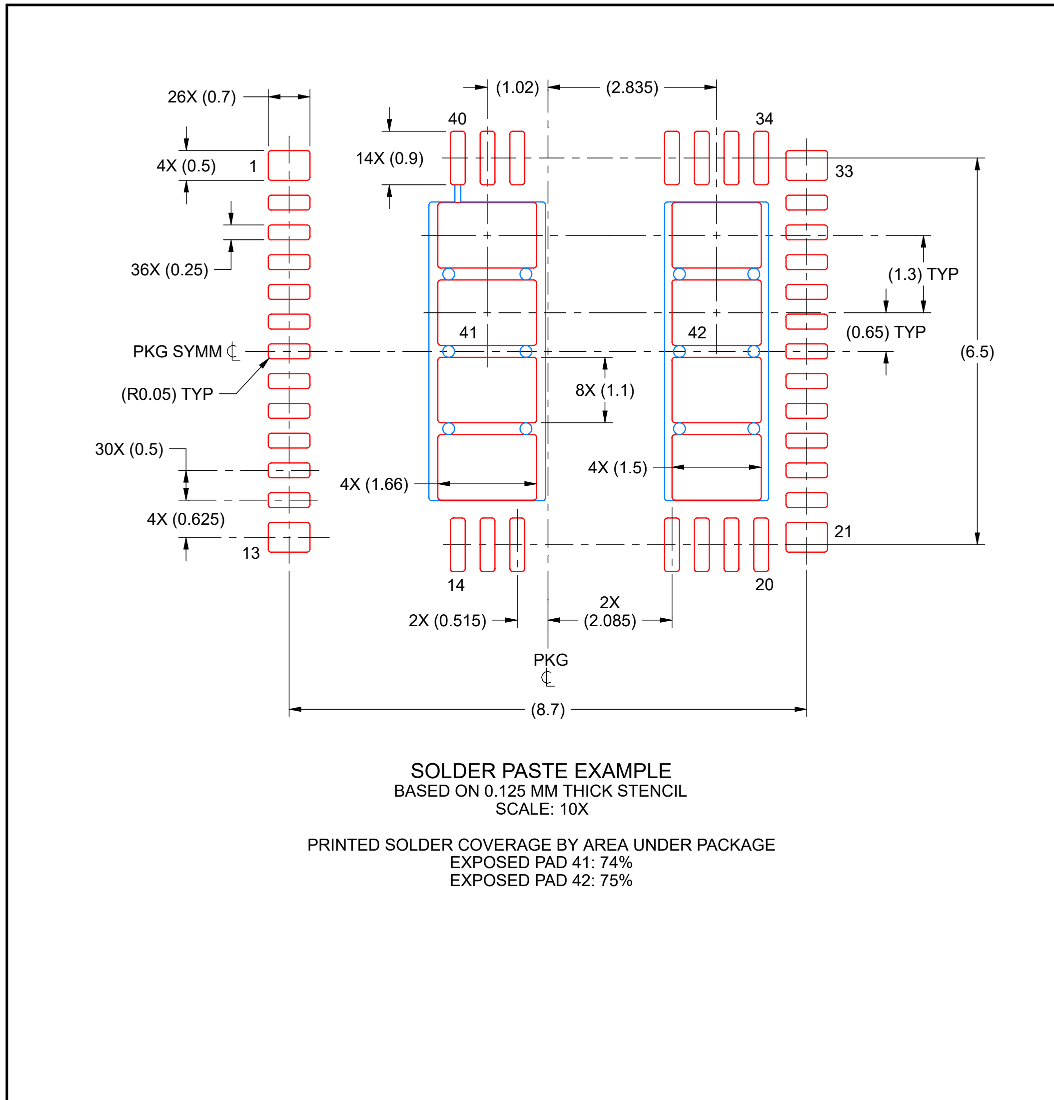
EXAMPLE STENCIL DESIGN

RRG0040A-C01

VQFN - 1.0 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



SOLDER PASTE EXAMPLE
BASED ON 0.125 MM THICK STENCIL
SCALE: 10X

PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
EXPOSED PAD 41: 74%
EXPOSED PAD 42: 75%

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

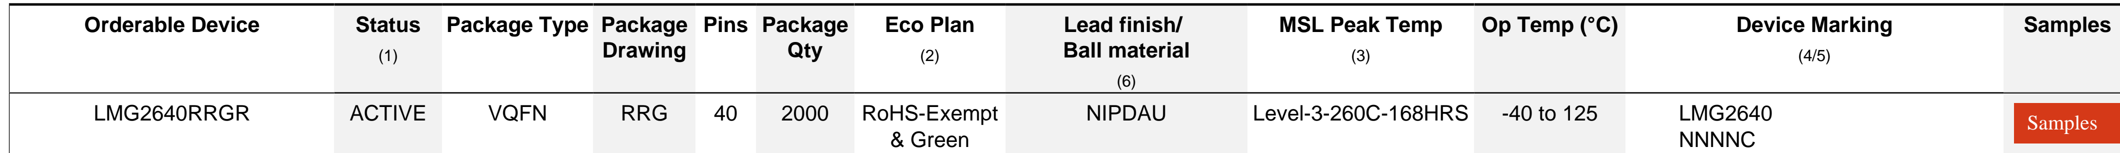
PACKAGING INFORMATION



Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMG2640RRGR	ACTIVE	VQFN	RRG	40	2000	RoHS-Exempt & Green	NIPDAU	Level-3-260C-168HRS	-40 to 125	LMG2640 NNNNC	Samples

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
