

# OPAx357 250MHz、レール・ツー・レールI/O、CMOSオペアンプ、シャットダウン付き

## 1 特長

- ユニティ・ゲイン帯域幅: 250MHz
- 広い帯域幅: 100MHz GBW
- 高いスルーレート: 150V/ $\mu$ s
- 低ノイズ:  $6.5\text{nV}/\sqrt{\text{Hz}}$
- レール・ツー・レールI/O
- 高い出力電流: 100mA超
- 非常に優れたビデオ性能
  - 差動ゲイン: 0.02%、差動フェーズ:  $0.09^\circ$
  - 0.1dBのゲイン・フラットネス(40MHz)
- 低い入力バイアス電流: 3pA
- 静止電流: 4.9mA
- サーマル・シャットダウン
- 電源電圧範囲: 2.5V~5.5V
- シャットダウン $I_Q$ : 6 $\mu$ A未満
- MicroSIZEパッケージ
- WEBENCH<sup>®</sup> Power Designerにより、OPA357を使用するカスタム設計を作成

## 2 アプリケーション

- ビデオ処理
- 超音波
- 光ネットワーク、調節可能なレーザー
- フォトダイオード・トランスインピーダンス・アンプ
- アクティブ・フィルタ
- 高速積分器
- A/Dコンバータ入力バッファ
- D/Aコンバータ出力アンプ
- バーコード・スキャナ
- 通信

## 3 概要

OPA357シリーズの高速、電圧帰還型CMOSオペアンプは、広い帯域幅を必要とするビデオおよびその他のアプリケーション用に設計されています。いずれもユニティ・ゲイン安定で、大きな出力電流を駆動できます。差動ゲインは0.02%、差動位相は $0.09^\circ$ です。静止電流はチャンネルごとにわずか4.9mAです。

OPA357シリーズのオペアンプは、最低2.5V ( $\pm 1.25\text{V}$ )、最高5.5V ( $\pm 2.75\text{V}$ )のシングルまたはデュアル電源で作動作するよう最適化されています。同相入力範囲は電源の範囲よりも拡大されています。出力スイングはレールから100mV以内で、広いダイナミック・レンジに対応しています。

シングル・バージョン(OPA357)は小型のSOT23-6パッケージで、デュアル・バージョン(OPA2357)はVSSOP-10パッケージで供給されます。

デュアル・バージョンは、完全に独立した回路により、クロストークを最小化し、干渉の発生を防止しています。どちらのバージョンも、拡張温度範囲の $-40^\circ\text{C}$ ~ $+125^\circ\text{C}$ で仕様が規定されています。

### 製品情報<sup>(1)</sup>

型番	パッケージ	本体サイズ(公称)
OPA357	SOT23 (6)	2.90mm×1.60mm
OPA2357	VSSOP (10)	3.00mm×3.00mm

(1) 提供されているすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。

## 4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Revision E (May 2009) から Revision F に変更	Page
• 「製品情報」の表、「ピン機能」の表、「ESD定格」の表、「推奨動作条件」の表、「熱に関する情報」の表、「概要」セクション、「機能ブロック図」セクション、「機能説明」セクション、「デバイスの機能モード」セクション、「アプリケーションと実装」セクション、「電源に関する推奨事項」セクション、「レイアウト」セクション、「デバイスおよびドキュメントのサポート」セクション、「メカニカル、パッケージ、および注文情報」セクション 追加 .....	1
• ドキュメント全体でMSOPをVSSOPに変更 .....	1
• DDAパッケージ(SO-8 PowerPAD)をドキュメントから削除.....	1
• ドキュメント全体でMSOPをVSSOPに変更 .....	1
• 「特長」にWEBENCHの項目を追加 .....	1
• Deleted OADI from DBV pin drawing .....	3
• Deleted Package/Ordering Information table .....	4
• Deleted footnote from <i>Signal input pins</i> parameter in <i>Absolute Maximum Ratings</i> table .....	4
• Changed <i>Temperature Range</i> section of <i>Electrical Characteristics</i> table: changed $\theta_{JA}$ to $R_{\theta JA}$ and deleted <i>Specified range</i> , <i>Operating range</i> , and <i>Storage range</i> parameters .....	6
• Added <i>OPAx357 Comparison</i> section and moved <i>OPAx357 Related Products</i> table to this section from page 1 .....	14
• Deleted first paragraph of <i>Power Dissipation</i> section.....	26
• Changed <i>PCB Layout</i> title to <i>Layout Guidelines</i> .....	26
• Deleted <i>PowerPAD Thermal Enhanced Package</i> and <i>PowerPAD Assembly Process</i> sections.....	26
• 追加「WEBENCH®ツールによるカスタム設計」セクション .....	27

## 5 Pin Configuration and Functions

(1) Pin 1 of the SOT23-6 is determined by orienting the package marking as indicated in the diagram.

### Pin Functions

NAME	PIN		I/O	DESCRIPTION
	DBV (SOT-23)	DGS (VSSOP)		
Enable	5	—	—	Amplifier power down. Low = disabled, high = normal operation (pin must be driven).
Enable A	—	5	—	Amplifier power down, channel A. Low = disabled, high = normal operation (pin must be driven).
Enable B	—	6	—	Amplifier power down, channel B. Low = disabled, high = normal operation (pin must be driven).
-In	4	—	I	Inverting input pin
-In A	—	2	I	Inverting input pin, channel A
-In B	—	8	I	Inverting input pin, channel B
+In	3	—	I	Noninverting input pin
+In A	—	3	I	Noninverting input pin, channel A
+In B	—	7	I	Noninverting input pin, channel B
Out	1	—	O	Output pin
Out A	—	1	O	Output pin, channel A
Out B	—	9	O	Output pin, channel B
V-	2	4	—	Negative power supply
V+	6	10	—	Positive power supply

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage, V+ to V-			7.5	V
Signal input pins	Voltage	(V-) – 0.5	(V+) + 0.5	V
	Current		10	mA
Enable input		(V-) – 0.5	(V+) + 0.5	V
Output short-circuit <sup>(2)</sup>		Continuous		
Operating temperature		–55	150	°C
Junction temperature			150	°C
Storage temperature, T <sub>stg</sub>		–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Short-circuit to ground, one amplifier per package.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>S</sub>	Total supply voltage			5.5	V
T <sub>A</sub>	Ambient temperature	–40	25	125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		OPA357	OPA2357	UNIT
		DBV (SOT-23)	DGS (VSSOP)	
		6 PINS	10 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	166.4	171.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	104.6	58.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	38.9	93.1	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	23.6	6.8	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	38.7	91.4	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	—	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics: $V_S = +2.7\text{-V}$ to $+5.5\text{-V}$ Single-Supply

at  $T_A = 25^\circ\text{C}$ ,  $R_F = 0\ \Omega$ ,  $R_L = 1\ \text{k}\Omega$ , and connected to  $V_S / 2$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>OFFSET VOLTAGE</b>						
$V_{OS}$	Input offset voltage	$V_S = +5\ \text{V}$		$\pm 2$	$\pm 8$	mV
		Specified temperature range, $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$			$\pm 10$	
$dV_{OS}/dT$	$V_{OS}$ vs temperature	Specified temperature range, $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		$\pm 4$		$\mu\text{V}/^\circ\text{C}$
PSRR	Power-supply rejection ratio	$V_S = +2.7\ \text{V}$ to $+5.5\ \text{V}$ , $V_{CM} = (V_S / 2) - 0.55\ \text{V}$		$\pm 200$	$\pm 800$	$\mu\text{V}/\text{V}$
		Specified temperature range, $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$			$\pm 900$	
<b>INPUT BIAS CURRENT</b>						
$I_B$	Input bias current			3	$\pm 50$	pA
$I_{OS}$	Input offset current			$\pm 1$	$\pm 50$	pA
<b>NOISE</b>

## 7 Detailed Description

### 7.1 Overview

The OPA357 is a CMOS, rail-to-rail I/O, high-speed, voltage-feedback operational amplifier designed for video, high-speed, and other applications. The device is available as a single or dual op amp.

The amplifier features a 100-MHz gain bandwidth, and 150-V/ $\mu$ s slew rate, but is unity-gain stable and can be operated as a +1-V/V voltage follower.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 OPAX357 Comparison

[Table 1](#) lists several members of the device family that includes the OPAX357.

**Table 1. OPAX357 Related Products**

PART NUMBER	FEATURED
OPA354	Non-shutdown version of OPA357 family
OPA355	200-MHz GBW, rail-to-rail output, CMOS, shutdown
OPA356	200-MHz GBW, rail-to-rail output, CMOS
OPA350, OPA353	38-MHz GBW, rail-to-rail input/output, CMOS
OPA631	75-MHz BW G = 2, rail-to-rail output
OPA634	150-MHz BW G = 2, rail-to-rail output
THS412x	100-MHz BW, differential input/output, 3.3-V supply

### 7.3.2 Operating Voltage

The OPA357 is specified over a power-supply range of +2.7 V to +5.5 V ( $\pm 1.35$  V to  $\pm 2.75$  V). However, the supply voltage can range from +2.5 V to +5.5 V ( $\pm 1.25$  V to  $\pm 2.75$  V). Supply voltages higher than 7.5 V (absolute maximum) can permanently damage the amplifier.

Parameters that vary over supply voltage or temperature are shown in the [Typical Characteristics](#) section.

### 7.3.3 Enable Function

The OPA357 enable function is implemented using a Schmitt trigger. The amplifier is enabled by applying a TTL high voltage level (referenced to  $V^-$ ) to the Enable pin. Conversely, a TTL low voltage level (referenced to  $V^-$ ) disables the amplifier, reducing its supply current from 4.9 mA to only 3.4  $\mu$ A per amplifier. Independent Enable pins are available for each channel (dual version), providing maximum design flexibility. For portable battery-operated applications, this feature can be used to greatly reduce the average current and thereby extend battery life.

The Enable input can be modeled as a CMOS input gate with a 100-k $\Omega$  pull-up resistor to  $V^+$ . Connect this pin to a valid high or low voltage or driven, not left open circuit.

The enable time is 100 ns and the disable time is only 30 ns. This time allows the OPA357 to be operated as a gated amplifier, or to have its output multiplexed onto a common output bus. When disabled, the output assumes a high-impedance state.

### 7.3.4 Rail-to-Rail Input

The specified input common-mode voltage range of the OPA357 extends 100 mV beyond the supply rails. This range is achieved with a complementary input stage—an N-channel input differential pair in parallel with a P-channel differential pair; see the [Functional Block Diagram](#) section. The N-channel pair is active for input voltages close to the positive rail, typically  $(V^+) - 1.2$  V to 100 mV above the positive supply, whereas the P-channel pair is on for inputs from 100 mV below the negative supply to approximately  $(V^+) - 1.2$  V. There is a small transition region, typically  $(V^+) - 1.5$  V to  $(V^+) - 0.9$  V, in which both pairs are on. This 600-mV transition region can vary  $\pm 500$  mV with process variation. Thus, the transition region (both input stages on) can range from  $(V^+) - 2.0$  V to  $(V^+) - 1.5$  V on the low end, up to  $(V^+) - 0.9$  V to  $(V^+) - 0.4$  V on the high end.

A double-folded cascode adds the signal from the two input pairs and presents a differential signal to the class AB output stage.

### 7.3.5 Rail-to-Rail Output

A class AB output stage with common-source transistors is used to achieve rail-to-rail output. For high-impedance loads ( $> 200 \Omega$ ), the output voltage swing is typically 100 mV from the supply rails. With 10- $\Omega$  loads, a useful output swing can be achieved while maintaining high open-loop gain; see [Figure 21](#) and [Figure 23](#).

### 7.3.6 Output Drive

The OPA357 output stage can supply a continuous output current of  $\pm 100$  mA and still provide approximately 2.7 V of output swing on a 5-V supply, as shown in Figure 33. For maximum reliability, TI recommends running a continuous DC current in excess of  $\pm 100$  mA; see Figure 21 and Figure 23. For supplying continuous output currents greater than  $\pm 100$  mA, the OPA357 can be operated in parallel as shown in Figure 34.

The OPA357 provides peak currents up to 200 mA, which corresponds to the typical short-circuit current. Therefore, an on-chip thermal shutdown circuit is provided to protect the OPA357 from dangerously high junction temperatures. At  $160^{\circ}\text{C}$ , the protection circuit shuts down the amplifier. Normal operation resumes when the junction temperature cools to below  $140^{\circ}\text{C}$ .

Figure 33. Laser Diode Driver

Figure 34. Parallel Operation

### 7.3.7 Video

The OPA357 output stage is capable of driving standard back-terminated 75-Ω video cables, as shown in [Figure 35](#). By back-terminating a transmission line, the cable does not exhibit a capacitive load to its driver. A properly back-terminated 75-Ω cable does not appear as capacitance; this cable presents only a 150-Ω resistive load to the OPA357 output.

**Figure 35. Single-Supply Video Line Driver**

The OPA357 can be used as an amplifier for RGB graphic signals, which have a voltage of zero at the video black level, by offsetting and AC-coupling the signal, as shown in [Figure 36](#).

(1) The source video signal offset is 300 mV above ground to accommodate the op amp swing-to-ground capability.

**Figure 36. RGB Cable Driver**

### 7.3.8 Wideband Video Multiplexing

One common application for video speed amplifiers that include an Enable pin is to wire multiple amplifier outputs together, then select which one of several possible video inputs to source onto a single line. This simple wired-OR video multiplexer can be easily implemented using the OPA357, as shown in Figure 37.

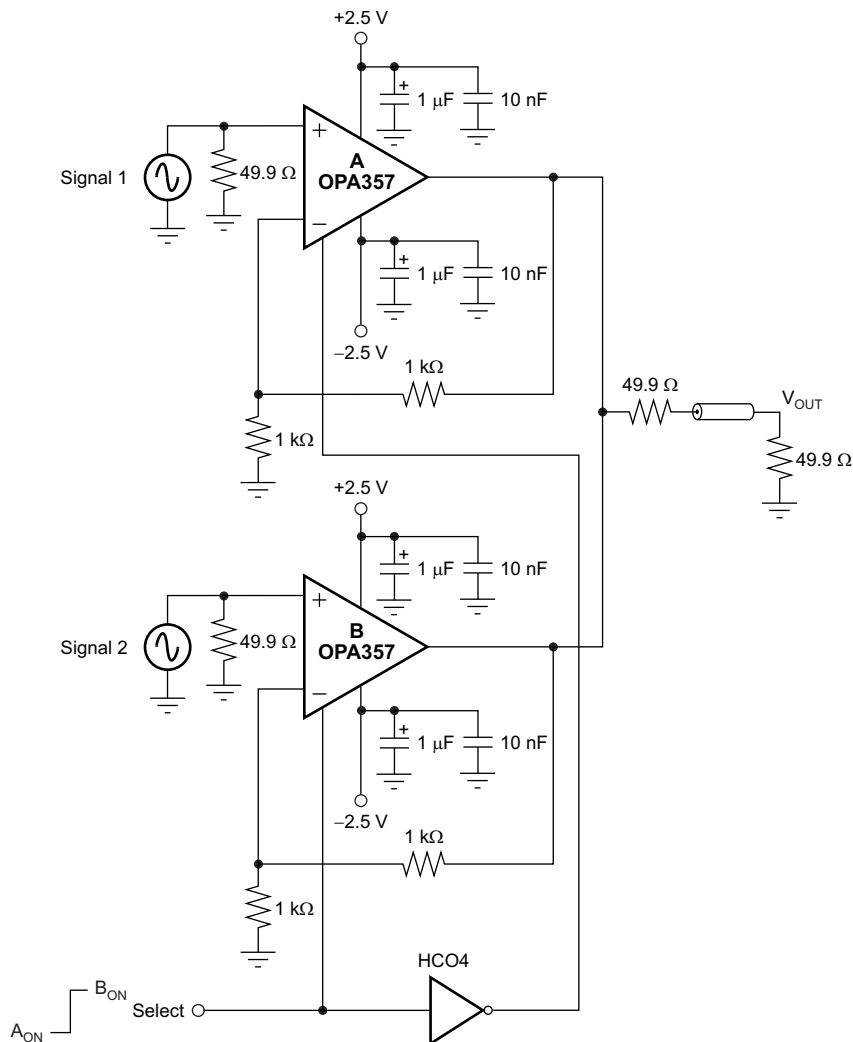

Figure 37. Multiplexed Output

### 7.3.9 Driving Analog-to-Digital Converters

The OPA357 series op amps offer 60 ns of settling time to 0.01%, making the series a good choice for driving high- and medium-speed sampling A/D converters and reference circuits. The OPA357 series provides an effective means of buffering the A/D converter input capacitance and resulting charge injection while providing signal gain.

Figure 38 shows the OPA357 driving an A/D converter. With the OPA357 in an inverting configuration, a capacitor across the feedback resistor can be used to filter high-frequency noise in the signal, as shown in Figure 38.

NOTE: A/D converter input = 0 V to  $V_{REF}$ .

NOTE:  $V_{IN}$  = 0 V to -5 V for a 0-V to 5-V output.

**Figure 38. The OPA357 in Inverting Configuration Driving an A/D Converter**

### 7.3.10 Capacitive Load and Stability

The OPA357 series of op amps can drive a wide range of capacitive loads. However, all op amps under certain conditions may become unstable. Op amp configuration, gain, and load value are just a few factors to consider when determining stability. An op amp in unity-gain configuration is most susceptible to the effects of capacitive loading. The capacitive load reacts with the op amp output resistance, along with any additional load resistance, to create a pole in the small-signal response that degrades the phase margin; see Figure 14 for details.

The OPA357 topology enhances its ability to drive capacitive loads. In unity gain, these op amps perform well with large capacitive loads. See Figure 15 for details.

One method of improving capacitive load drive in the unity-gain configuration is to insert a 10-Ω to 20-Ω resistor in series with the output, as shown in Figure 39. This method significantly reduces ringing with large capacitive loads; see Figure 14. However, if there is a resistive load in parallel with the capacitive load,  $R_S$  creates a voltage divider. This process introduces a DC error at the output and slightly reduces output swing. This error can be insignificant. For instance, with  $R_L = 10\text{ k}\Omega$  and  $R_S = 20\ \Omega$ , there is only about a 0.2% error at the output.

**Figure 39. Series Resistor in Unity-Gain Configuration Improves Capacitive Load Drive**

### 7.3.11 Wideband Transimpedance Amplifier

Wide bandwidth, low input bias current, and low input voltage and current noise make the OPA357 an ideal wideband photodiode transimpedance amplifier for low-voltage single-supply applications. Low-voltage noise is important because photodiode capacitance causes the effective noise gain of the circuit to increase at high frequency.

The key elements to a transimpedance design, as shown in Figure 40, are the expected diode capacitance (including the parasitic input common-mode and differential-mode input capacitance (2 + 2)pF for the OPA357), the desired transimpedance gain ( $R_F$ ), and the gain bandwidth product (GBP) for the OPA357 (100 MHz). With these three variables set, the feedback capacitor value ( $C_F$ ) can be set to control the frequency response.

Figure 40. Transimpedance Amplifier

To achieve a maximally flat 2nd-order Butterworth frequency response, set the feedback pole to:

$$\frac{1}{2\pi R_F C_F} = \sqrt{\frac{\text{GBP}}{4\pi R_F C_D}} \quad (1)$$

Typical surface-mount resistors have a parasitic capacitance of approximately 0.2 pF that must be deducted from the calculated feedback capacitance value.

Bandwidth is calculated by:

$$f_{-3\text{dB}} = \sqrt{\frac{\text{GBP}}{2\pi R_F C_D}} \text{ Hz} \quad (2)$$

For even higher transimpedance bandwidth, the high-speed CMOS OPA355 (200-MHz GBW) or the OPA655 (400-MHz GBW) can be used.

## 7.4 Device Functional Modes

The OPAx357 family of devices is powered on when the supply is connected. The devices can be operated as single-supply operational amplifiers or dual-supply amplifiers depending on the application. The devices can also be used with asymmetrical supplies as long as the differential voltage ( $V_-$  to  $V_+$ ) is at least 1.8 V and no greater than 5.5 V (for example, when  $V_-$  is set to  $-3.5$  V and  $V_+$  is set to 1.5 V).

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The OPAx357 family of devices is a CMOS, rail-to-rail I/O, high-speed, voltage-feedback operational amplifier designed for video, high-speed, and other applications. The OPAx357 family of devices is available as a single or dual op-amp.

The amplifier features a 100-MHz gain bandwidth, and 150-V/ $\mu$ s slew rate, but the device is unity-gain stable and operates as a 1-V/V voltage follower.

### 8.2 Typical Applications

#### 8.2.1 Transimpedance Amplifier

Wide gain bandwidth, low input bias current, low input voltage, and current noise make the OPAx357 family of devices an ideal wideband photodiode transimpedance amplifier. Low-voltage noise is important because photodiode capacitance causes the effective noise gain of the circuit to increase at high frequency. The key elements to a transimpedance design, as shown in Figure 41, are the expected diode capacitance, (which include the parasitic input common-mode and differential-mode input capacitance) the desired transimpedance gain, and the gain-bandwidth (GBW) for the OPAx357 family of devices (20 MHz). With these three variables set, the feedback capacitor value is set to control the frequency response. Feedback capacitance includes the stray capacitance, which is 0.2 pF for a typical surface-mount resistor.

Figure 41. Dual-Supply Transimpedance Amplifier

## Typical Applications (continued)

### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in [Table 2](#) as the input parameters.

**Table 2. Design Parameters**

PARAMETER	EXAMPLE VALUE
Supply voltage, $V_{(V+)}$	2.5 V
Supply voltage, $V_{(V-)}$	-2.5 V

$C_{(F)}$  is optional to prevent gain peaking.  $C_{(F)}$  includes the stray capacitance of  $R_{(F)}$ .

### 8.2.1.2 Detailed Design Procedure

#### 8.2.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the **OPA357** device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

#### 8.2.1.2.2 OPAx357 Design Procedure

To achieve a maximally-flat, second-order Butterworth frequency response, set the feedback pole using [Equation 3](#).

$$\frac{1}{2 \times \pi \times R_{(F)} \times C_{(F)}} = \sqrt{\frac{GBW}{4 \times \pi \times R_{(F)} \times C_{(D)}}} \quad (3)$$

Calculate the bandwidth using [Equation 4](#).

$$f_{(-3 \text{ dB})} = \sqrt{\frac{GBW}{2 \times \pi \times R_{(F)} \times C_{(D)}}} \quad (4)$$

For other transimpedance bandwidths, consider the high-speed CMOS [OPA380](#) (90-MHz GBW), [OPA354](#) (100-MHz GBW), [OPA300](#) (180-MHz GBW), [OPA355](#) (200-MHz GBW), or [OPA656](#) and [OPA657](#) (400-MHz GBW).

For single-supply applications, the +INx input can be biased with a positive DC voltage to allow the output to reach true zero when the photodiode is not exposed to any light, and respond without the added delay that results from coming out of the negative rail; [Figure 42](#) shows this configuration. This bias voltage appears across the photodiode, providing a reverse bias for faster operation.

**Figure 42. Single-Supply Transimpedance Amplifier**

For additional information, see the [Compensate Transimpedance Amplifiers Intuitively](#) application bulletin.

#### 8.2.1.2.2.1 Optimizing the Transimpedance Circuit

To achieve the best performance, components must be selected according to the following guidelines:

1. For lowest noise, select  $R_{(F)}$  to create the total required gain. Using a lower value for  $R_{(F)}$  and adding gain after the transimpedance amplifier generally produces poorer noise performance. The noise produced by  $R_{(F)}$  increases with the square-root of  $R_{(F)}$ , whereas the signal increases linearly. Therefore, signal-to-noise ratio improves when all the required gain is placed in the transimpedance stage.
2. Minimize photodiode capacitance and stray capacitance at the summing junction (inverting input). This capacitance causes the voltage noise of the op amp to amplify (increasing amplification at high frequency). Using a low-noise voltage source to reverse-bias a photodiode reduce the capacitance. Smaller photodiodes have lower capacitance. Use optics to concentrate light on a small photodiode.
3. Noise increases with increased bandwidth. Limit the circuit bandwidth to only the required bandwidth. Use a capacitor across the  $R_{(F)}$  to limit bandwidth, even if a capacitor not required for stability.
4. Circuit board leakage degrades the performance of an otherwise well-designed amplifier. Clean the circuit board carefully. A circuit board guard trace that encircles the summing junction and is driven at the same voltage helps control leakage.

### 8.2.1.3 Application Curve

Figure 43. AC Transfer Function

### 8.2.2 High-Impedance Sensor Interface

Many sensors have high source impedances that can range up to 10 M $\Omega$ , or even higher. The output signal of sensors often must be amplified or otherwise conditioned by an amplifier. The input bias current of this amplifier can load the sensor output and cause a voltage drop across the source resistance, as shown in Figure 44, where  $(V_{(+INx)} = V_S - I_{(BIAS)} \times R_{(S)})$ . The last term,  $I_{(BIAS)} \times R_{(S)}$ , shows the voltage drop across  $R_{(S)}$ . To prevent errors introduced to the system as a result of this voltage, use an op amp with low input bias current and high-impedance sensors. This low current keeps the error contribution by  $I_{(BIAS)} \times R_{(S)}$  less than the input voltage noise of the amplifier, so that the amplifier does not become the dominant noise factor. The OPAx357 family of devices series of op amps feature low input bias current (typically 200 fA), and are therefore designed for such applications.

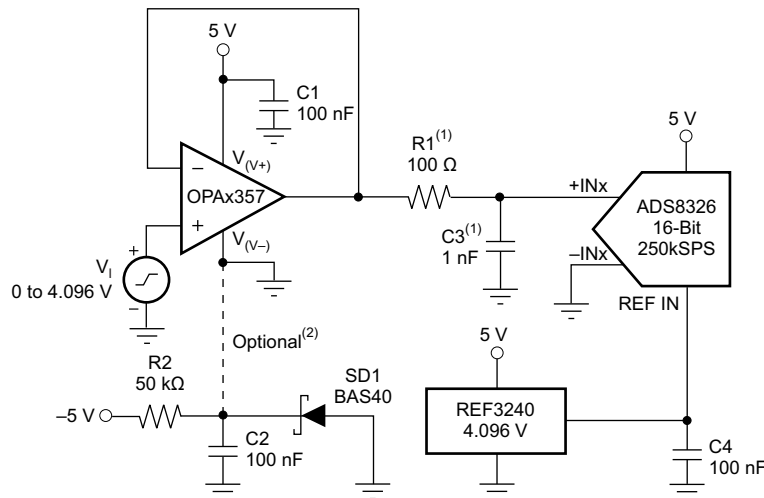

Figure 44. Noise as a Result of  $I_{(BIAS)}$

### 8.2.3 Driving ADCs

The OPAx357 op amps are designed for driving sampling analog-to-digital (A/D) converters with sampling speeds up to 1 MSPS. The zero-crossover distortion input stage topology allows the OPAx357 family of devices to drive A/D converters without degradation of differential linearity and THD.

The OPAx357 family of devices can be used to buffer the A/D converter switched input capacitance and resulting charge injection while providing signal gain. Figure 45 shows the OPAx357 family of devices configured to drive the ADS8326.

(1) Suggested value; may require adjustment based on specific application.

(2) Single-supply applications lose a small number of A/D converter codes near ground as a result of op amp output swing limitation. If a negative power supply is available, this simple circuit creates a -0.3-V supply to allow output swing to true ground potential.

**Figure 45. Driving the ADS8326**

### 8.2.4 Active Filter

The OPAx357 family of devices is designed for active filter applications that require a wide bandwidth, fast slew rate, low-noise, single-supply operational amplifier. Figure 46 shows a 500-kHz, second-order, low-pass filter using the multiple-feedback (MFB) topology. The components are selected to provide a maximally-flat Butterworth response. Beyond the cutoff frequency, roll-off is  $-40$  dB/dec. The Butterworth response is designed for applications requiring predictable gain characteristics, such as the antialiasing filter used in front of an A/D converter.

One point to note when considering the MFB filter is that the output is inverted relative to the input. If this inversion is not required, or not desired, a noninverting output can be achieved through one of the following options:

1. Adding an inverting amplifier
2. Adding an additional second-order MFB stage
3. Using a noninverting filter topology, such as the Sallen-Key (see Figure 47).

MFB and Sallen-Key, low-pass and high-pass filter synthesis is accomplished using TI's FilterPro™ program. This software is available as a free download on [www.ti.com](http://www.ti.com).

**Figure 46. Second-Order, Butterworth, 500-kHz, Low-Pass Filter**

**Figure 47. OPAx357 Configured as a Three-Pole, 20-kHz, Sallen-Key Filter**

## 9 Power Supply Recommendations

### 9.1 Power Dissipation

For resistive loads, the maximum power dissipation occurs at a DC output voltage of one-half the power-supply voltage. Dissipation with AC signals is lower. The [Power Amplifier Stress and Power Handling Limitations](#) application note explains how to calculate or measure power dissipation with unusual signals and loads, and can be found at [www.ti.com](http://www.ti.com). Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heat sink. For reliable operation, limit junction temperature to 150°C, maximum. To estimate the margin of safety in a complete design, increase the ambient temperature until the thermal protection is triggered at 160°C. The thermal protection should trigger more than 35°C above the maximum expected ambient condition of your application.

## 10 Layout

### 10.1 Layout Guidelines

Use good high-frequency printed circuit board (PCB) layout techniques for the OPA357. Generous use of ground planes, short and direct signal traces, and a suitable bypass capacitor located at the V+ pin assures clean, stable operation. Large areas of copper also provide a means of dissipating heat that is generated in normal operation.

Sockets are definitely not recommended for use with any high-speed amplifier.

A 10-nF ceramic bypass capacitor is the minimum recommended value; adding a 1- $\mu$ F or larger tantalum capacitor in parallel can be beneficial when driving a low-resistance load. Providing adequate bypass capacitance is essential to achieving very low harmonic and intermodulation distortion.

### 10.2 Layout Example

**Figure 48. Example Layout**

## 11 デバイスおよびドキュメントのサポート

### 11.1 デバイス・サポート

#### 11.1.1 開発サポート

##### 11.1.1.1 WEBENCH®ツールによるカスタム設計

[ここをクリック](#)すると、WEBENCH® Power Designerにより、**OPA357**を使用するカスタム設計を作成できます。

- 最初に、入力電圧( $V_{IN}$ )、出力電圧( $V_{OUT}$ )、出力電流( $I_{OUT}$ )の要件を入力します。
- 最適化ツールのダイヤルを使用して、効率、占有面積、コストなどの主要なパラメータについて設計を最適化します。
- 生成された設計を、テキサス・インスツルメンツが提供する他のソリューションと比較します。

WEBENCH Power Designerでは、カスタマイズされた回路図と部品リストを、リアルタイムの価格と部品の在庫情報と併せて参照できます。

ほとんどの場合、次の操作を実行可能です。

- 電気的なシミュレーションを実行し、重要な波形と回路の性能を確認する。
- 熱シミュレーションを実行し、基板の熱特性を把握する。
- カスタマイズされた回路図やレイアウトを、一般的なCADフォーマットでエクスポートする。
- 設計のレポートをPDFで印刷し、同僚と設計を共有する。

WEBENCHツールの詳細は、[www.ti.com/WEBENCH](http://www.ti.com/WEBENCH)でご覧になれます。

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0006A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214840/G 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## 重要なお知らせと免責事項

TI は、技術データと信頼性データ(データシートを含みます)、設計リソース(リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
