

SN65HVD888 IEC-ESD保護機能およびバス極性訂正機能を備えたRS-485 トランシーバ

1 特長

- EIA-485規格の要件を上回る
- 76ms (t_{FS})以内のバス極性訂正機能
- データ速度: 300bps~250kbps
- 2つの構成に対応:
 - フェールセーフ抵抗のみ
 - フェールセーフおよび差動終端抵抗
- 1つのバスで最大256のノードに対応(1/8単位負荷)
- SOIC-8パッケージにより下位互換性を確保
- バス・ピン保護:
 - $\pm 16\text{kV}$ HBM保護
 - $\pm 12\text{kV}$ IEC61000-4-2接触放電
 - $\pm 4\text{kV}$ IEC61000-4-4高速過渡バースト

2 アプリケーション

- eメータ・ネットワーク
- 産業用オートメーション
- HVACシステム
- DMX512ネットワーク
- プロセス制御
- バッテリ駆動のアプリケーション
- モーション・コントロール
- 通信機器

3 概要

SN65HVD888は、自動バス極性訂正機能と過渡保護機能を備えた低消費電力のRS-485トランシーバです。ホットプラグ時に、76ms以内のバス・アイドル時間で、バス極性の検出と訂正を行います。内蔵の過渡保護機能がIEC61000 ESDおよびEFT過渡事象からデバイスを保護します。このデバイスは、要求の厳しい産業アプリケーションにも対応する、強力なドライバとレシーバを搭載しています。バスのピンは静電放電(ESD)事象に対する耐性を備えており、人体モデル(HBM)、エアギャップ放電、接触放電の仕様に関して高レベルの保護を実現しています。

差動ドライバと差動レシーバを組み合わせており、ともに5Vの単一電源で動作します。ドライバの差動出力とレシーバの差動入力はいくつかの接続され、半二重(2線式バス)通信に適したバス・ポートを形成しています。同相電圧範囲が広いことから、このデバイスは長いケーブルを使用するマルチポイント・アプリケーションに適しています。

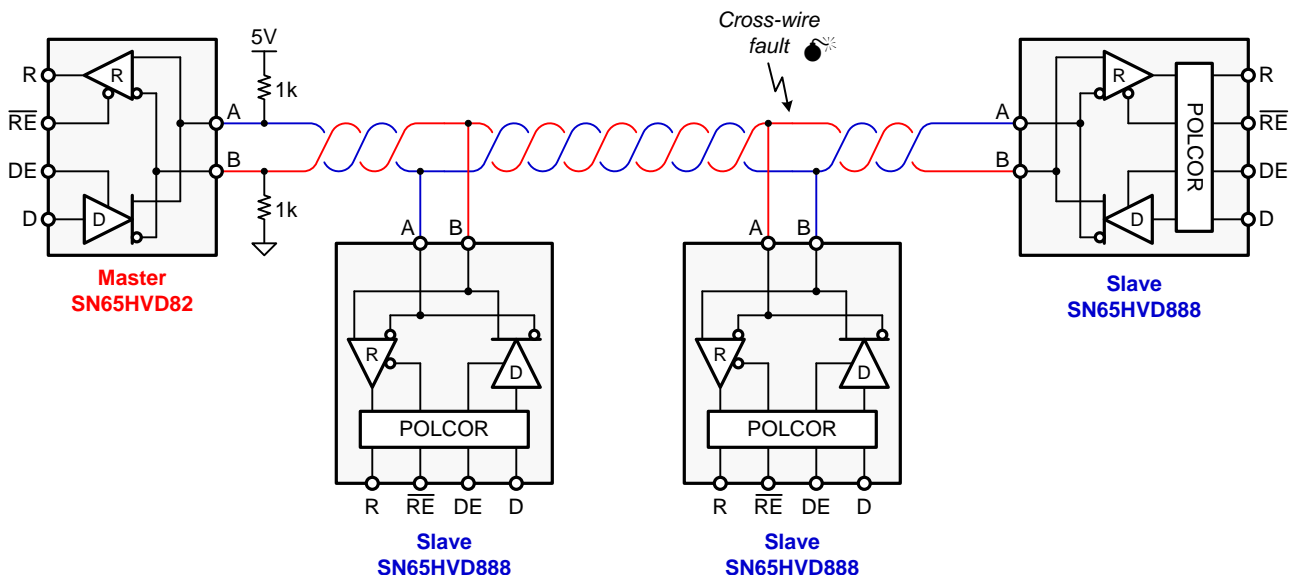

SN65HVD888はSOIC-8パッケージで供給され、 -40°C ~ 125°C で動作が規定されています。

\overline{RE}	2	Digital input	Receiver enable, active low
V _{CC}	8	Supply	4.5-V to 5.5-V supply

6 Specifications

6.1 Absolute Maximum Ratings

(see ⁽¹⁾)

		MIN	MAX	UNIT
V _{CC}	Supply voltage	-0.5	7	V
	Input voltage at any logic pin	-0.3	5.7	V
	Voltage input, transient pulse, A and B, through 100 Ω	-100	100	V
	Voltage at A or B inputs	-18	18	V
	Receiver output current	-24	24	mA
	Continuous total-power dissipation	See (Thermal Information) table		
T _J	Junction temperature		170	°C
T _{STG}	Storage temperature	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings: JEDEC Specifications

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±8000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500
		Machine model (MM)	±100

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 ESD Ratings: IEC Specifications

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	IEC 61000-4-2 ESD (Contact Discharge), bus terminals and GND	± 12000
		IEC 61000-4-4 EFT (Fast transient or burst) bus terminals and GND	± 4000
		IEC 60749-26 ESD (HBM), bus terminals and GND	± 16000

6.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	4.5	5	5.5	V
V_{ID}	Differential input voltage	-12		12	V
V_I	Input voltage at any bus terminal (separate or common mode) ⁽¹⁾	-7		12	V
V_{IH}	High-level input voltage (driver, driver-enable, and receiver-enable inputs)	2		V_{CC}	V
V_{IL}	Low-level input voltage (driver, driver-enable, and receiver-enable inputs)	0		0.8	V
I_O	Output current	Driver		60	mA
		Receiver	-8	8	
C_L	Differential load capacitance		50		pF
R_L	Differential load resistance		60		Ω
$1/t_{UI}$	Signaling rate	0.3		250	kbps
T_J	Junction temperature	-40		150	$^{\circ}\text{C}$
$T_A^{(2)}$	Operating free-air temperature (see Thermal Information for additional information)	-40		125	$^{\circ}\text{C}$

(1) The algebraic convention in which the least positive (most negative) limit is designated as minimum is used in this data sheet.

(2) Operation is specified for internal (junction) temperatures up to 150 $^{\circ}\text{C}$. Self-heating due to internal power dissipation should be considered for each application. Maximum junction temperature is internally limited by the thermal shut-down (TSD) circuit which disables the driver outputs when the junction temperature reaches 170 $^{\circ}\text{C}$.

6.5 Thermal Information

THERMAL METRIC ⁽¹⁾		SN65HVD888	UNIT
		D (SOIC)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	116.1	$^{\circ}\text{C}/\text{W}$
$R_{\theta JC(\text{top})}$	Junction-to-case (top) thermal resistance	60.8	$^{\circ}\text{C}/\text{W}$
$R_{\theta JB}$	Junction-to-board thermal resistance	57.1	$^{\circ}\text{C}/\text{W}$
Ψ_{JT}	Junction-to-top characterization parameter	13.9	$^{\circ}\text{C}/\text{W}$
Ψ_{JB}	Junction-to-board characterization parameter	56.5	$^{\circ}\text{C}/\text{W}$

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

8 Detailed Description

8.1 Overview

The SN65HVD888 device is a half-duplex RS-485 transceiver suitable for data transmission at rates up to 250 kbps over controlled-impedance transmission media (such as twisted-pair cabling). The device features a high level of internal transient protection, making it able to withstand up to 12 kV (per IEC 61000-4-2) and EFT transients up to 4 kV (per IEC 61000-4-4) without incurring damage. Up to 256 units of SN65HVD888 may share a common RS-485 bus due to the device's low bus input currents. The device features automatic polarity correction, which detects bus mis-wirings at start-up and then swaps the *A* and *B* halves of the bus if needed.

8.2 Functional Block Diagram

Copyright © 2018, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Low-Power Standby Mode

When the driver and the receiver are both disabled ($DE = \text{Low}$ and $RE = \text{High}$) the device enters standby mode. If the enable inputs are in the disabled state for only a brief time (for example: less than 100 ns), the device does not enter standby mode, preventing the SN65HVD888 from entering standby mode during driver or receiver enabling. Only when the enable inputs are held in the disabled state for a duration of 300 ns or more does the device enter low-power standby mode. In this mode most internal circuitry is powered down, and the steady-state supply current is typically less than 400 nA. When either the driver or the receiver is re-enabled, the internal circuitry becomes active. During V_{CC} power-up, when the device is set for both driver and receiver disabled mode, the device may consume more than 5- μA of I_{CC} disabled current because of capacitance charging effects. This condition occurs only during V_{CC} power up.

8.3.2 Bus Polarity Correction

The SN65HVD888 automatically corrects a wrong bus-signal polarity caused by a cross-wire fault. In order to detect the bus polarity, all three of the following conditions must be met:

- A failsafe-biasing network (commonly at the master node) must define the signal polarity of the bus
- A slave node must enable the receiver and disable the driver ($\overline{RE} = DE = \text{Low}$)
- The bus must idle for the failsafe time, t_{FS-max}

After the failsafe time has passed, the polarity correction is complete and is applied to both the receive and transmit channels. The status of the bus polarity is latched within the transceiver and is maintained for subsequent data transmissions.

NOTE

Data string durations of consecutive 0s or 1s exceeding t_{FS-min} can accidentally trigger a wrong polarity correction and must be avoided.

Figure 13 shows a simple point-to-point data link between a master node and a slave node. Because the master node with the failsafe biasing network determines the signal polarity on the bus, an RS-485 transceiver without polarity correction, such as SN65HVD82, suffices. All other bus nodes, typically performing as slaves, require the SN65HVD888 transceiver with polarity correction.

Feature Description (continued)

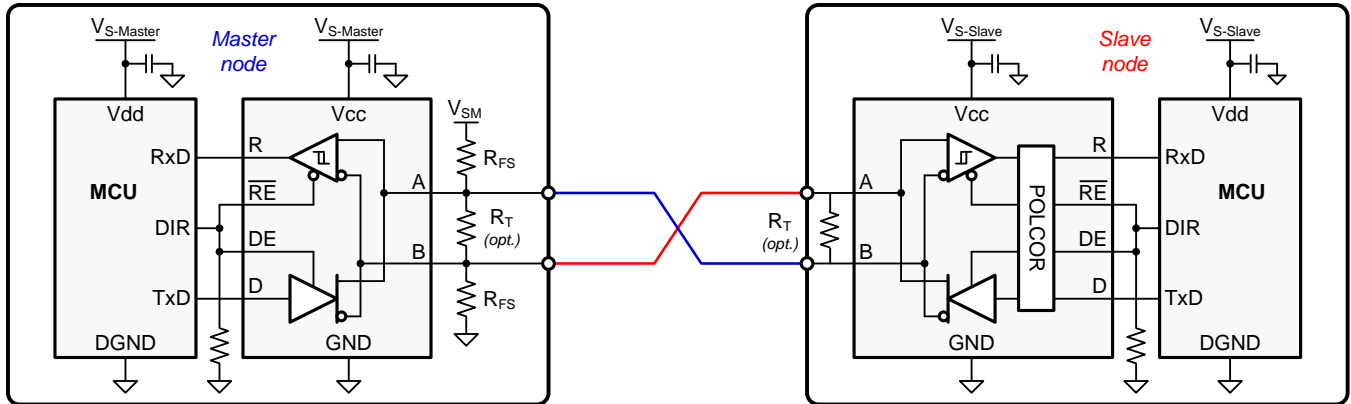

Figure 13. Point-To-Point Data Link With Cross-Wire Fault

Prior to initiating data transmission the master transceiver must idle for a time span that exceeds the maximum failsafe time, t_{FS-max} , of a slave transceiver. This idle time is accomplished by driving the direction control line, DIR, low. After a time, $t > t_{FS-max}$, the master begins transmitting data.

Because of the indicated cross-wire fault between master and slave, the slave node receives bus signals with reversed polarity. Assuming the slave node has just been connected to the bus, the direction-control pin is pulled-down during power-up and then is actively driven low by the slave MCU. The polarity correction begins as soon as the slave supply is established and ends after approximately 44 to 76 ms.

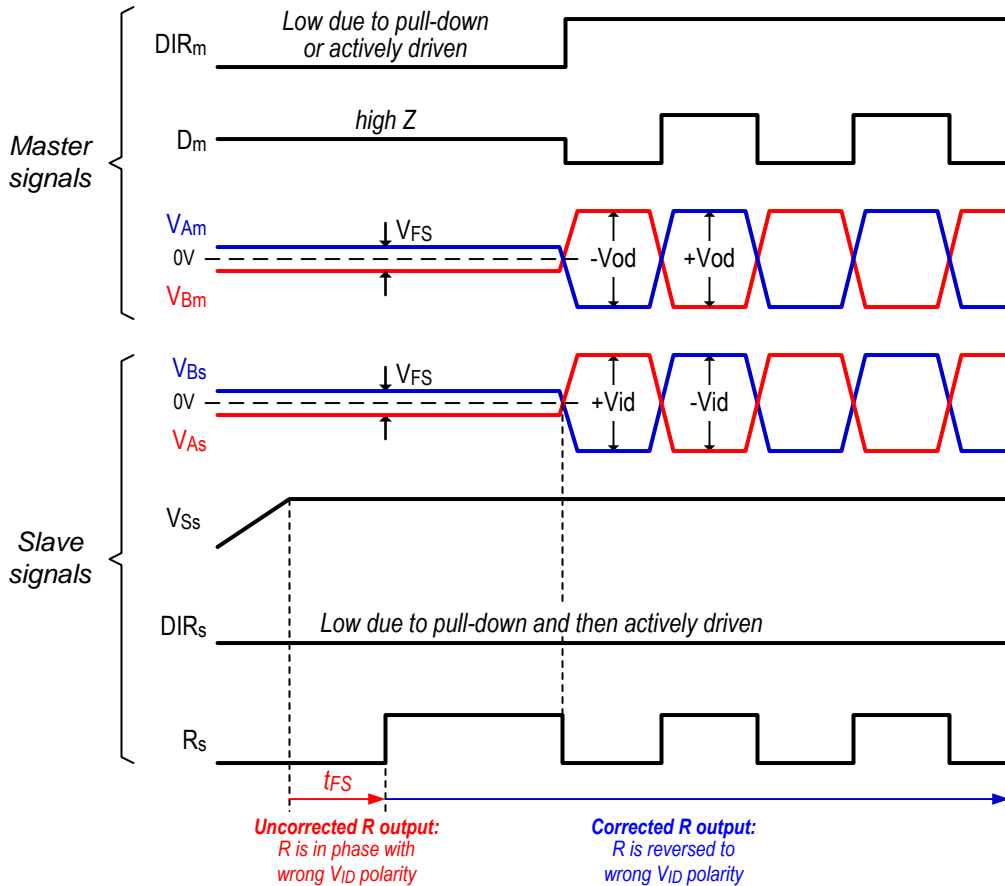

Figure 14. Polarity Correction Timing Prior to a Data Transmission

Feature Description (continued)

Initially the slave receiver assumes that the correct bus polarity is applied to the inputs and performs no polarity reversal. Because of the reversed polarity of the bus-failsafe voltage, the output of the slave receiver, R_S , turns low. After t_{FS} has passed and the receiver has detected the wrong bus polarity, the internal POLCOR logic reverses the input signal and R_S turns high.

At this point all incoming bus data with reversed polarity are polarity corrected within the transceiver. Because polarity correction is also applied to the transmit path, the data sent by the slave MCU are reversed by the POLCOR logic and then fed into the driver.

The reversed data from the slave MCU are reversed again by the cross-wire fault in the bus, and the correct bus polarity is reestablished at the master end.

This process repeats each time the device powers up and detects an incorrect bus polarity.

8.4 Device Functional Modes

Table 1. Driver Pin Functions

INPUT	ENABLE	OUTPUTS		DESCRIPTION
D	DE	A	B	
NORMAL MODE				
H	H	H	L	Actively drives bus High
L	H	L	H	Actively drives bus Low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drives bus High
POLARITY-CORRECTING MODE⁽¹⁾				
H	H	L	H	Actively drives bus Low
L	H	H	L	Actively drives bus High
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	L	H	Actively drives bus Low

(1) The polarity-correcting mode is entered when $V_{ID} < V_{IT-}$ and $t > t_{FS}$ and $DE = \text{low}$. This state is latched when \overline{RE} turns from Low to High.

Table 2. Receiver Pin Functions

DIFFERENTIAL INPUT	ENABLE	OUTPUT	DESCRIPTION
$V_{ID} = V_A - V_B$	\overline{RE}	R	
NORMAL MODE			
$V_{IT+} < V_{ID}$	L	H	Receive valid bus High
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	L	Receive valid bus Low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled
Open, short, idle Bus	L	?	Indeterminate bus state
POLARITY-CORRECTING MODE⁽¹⁾			
$V_{IT+} < V_{ID}$	L	L	Receive valid bus Low
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	H	Receive polarity corrected bus High
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled
Open, short, idle Bus	L	?	Indeterminate bus state

(1) The polarity-correcting mode is entered when $V_{ID} < V_{IT-}$ and $t > t_{FS}$ and $DE = \text{low}$. This state is latched when \overline{RE} turns from Low to High.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Device Configuration

The SN65HVD888 is a half-duplex RS-485 transceiver operating from a single 5-V $\pm 10\%$ supply. The driver and receiver enable pins allow for the configuration of different operating modes.

Copyright © 2018, Texas Instruments Incorporated

Figure 16. Transceiver Configurations

Using independent enable lines provides the most flexible control as the lines allow for the driver and the receiver to be turned on and turned off individually. While this configuration requires two control lines, it allows for selective listening to the bus traffic, whether the driver is transmitting data or not. Only this configuration allows the SN65HVD888 to enter low-power standby mode because it allows both the driver and receiver to be disabled simultaneously.

Combining the enable signals simplifies the interface to the controller by forming a single direction-control signal. Thus, when the direction-control line is high, the transceiver is configured as a driver, while for a low the device operates as a receiver.

Tying the receiver enable to ground and controlling only the driver-enable input also uses only one control line. In this configuration a node not only receives the data on the bus sent by other nodes but also receives the data sent on the bus, enabling the node to verify the correct data has been transmitted.

9.1.2 Bus Design

An RS-485 bus consists of multiple transceivers connected in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor, R_T , whose value matches the characteristic impedance, Z_0 , of the cable. This method, known as parallel termination, allows for relatively high data rates over long cable length.

Common cables used are unshielded twisted pair (UTP), such as low-cost CAT-5 cable with $Z_0 = 100 \Omega$, and RS-485 cable with $Z_0 = 120 \Omega$. Typical cable sizes are AWG 22 and AWG 24.

The maximum bus length is typically given as 4000 ft or 1200 m, and represents the length of an AWG 24 cable whose cable resistance approaches the value of the termination resistance, thus reducing the bus signal by half or 6 dB. Actual maximum usable cable length depends on the signaling rate, cable characteristics, and environmental conditions.

Application Information (continued)

Table 3. VID with a Failsafe Network and Bus Termination

V _{CC}	R _L DIFFERENTIAL TERMINATION	R _{FS} PULLUP	R _{FS} PULLDOWN	V _{ID}
5 V	54 Ω	560 Ω	560 Ω	230 mV
		1 KΩ	1 KΩ	131 mV
		4.7 KΩ	4.7 KΩ	29 mV
		10 KΩ	10 KΩ	13 mV

An external failsafe-resistor network must be used to ensure failsafe operation during an idle bus state. When the bus is not actively driven, the differential receiver inputs could float allowing the receiver output to assume a random output. A proper failsafe network forces the receiver inputs to exceed the V_{IT} threshold, thus forcing the SN65HVD888 receiver output into the failsafe (high) state. Table 3 shows the differential input voltage (V_{ID}) for various failsafe networks with a 54-Ω differential bus termination.

9.1.3 Cable Length Versus Data Rate

There is an inverse relationship between data rate and cable length, which means the higher the data rate, the shorter the cable length; and conversely, the lower the data rate the longer the cable length. While most RS-485 systems use data rates between 10 kbps and 100 kbps, applications such as e-metering often operate at rates of up to 250 kbps even at distances of 4000 ft and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

Figure 17. Cable Length vs Data Rate Characteristic

9.1.4 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. The reason for the short distance is because a stub presents a non-terminated piece of bus line which can introduce reflections if the distance is too long. As a general guideline, the electrical length or round-trip delay of a stub should be less than one-tenth of the rise time of the driver, thus leading to a maximum physical stub length of as shown in Equation 1.

$$L_{\text{Stub}} \leq 0.1 \times t_r \times v \times c$$

where

- t_r is the 10/90 rise time of the driver
- c is the speed of light (3 × 10⁸ m/s or 9.8 × 10⁸ ft/s)
- v is the signal velocity of the cable (v = 78%) or trace (v = 45%) as a factor of c

Based on Equation 1, with a minimum rise time of 400 ns, Equation 2 shows the maximum cable-stub length of the SN65HVD888.

$$L_{\text{Stub}} \leq 0.1 \times 400 \times 10^{-9} \times 3 \times 10^8 \times 0.78 = 9.4 \text{ m (or 30.6 ft)}$$

Figure 18. Stub Length

9.1.5 3- to 5-V Interface

Interfacing the SN65HVD888 to a 3-V controller is easy. Because the 5-V logic inputs of the transceiver accept 3-V input signals they can be directly connected to the controller I/O. The 5-V receiver output, R, however must be level-shifted by a Schottky diode and a 10-k resistor to connect to the controller input (see Figure 19). When R is high, the diode is reverse biased and the controller supply potential lies at the controller RxD input. When R is low, the diode is forward biased and conducts. In this case only the diode forward voltage of 0.2 V lies at the controller RxD input.

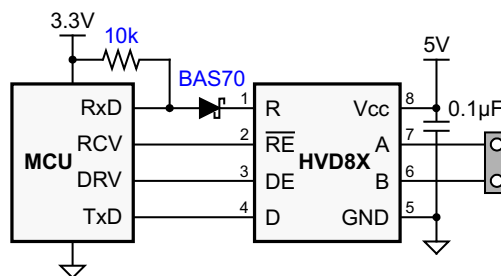

Figure 19. 3-V to 5-V Interface

9.1.6 Noise Immunity

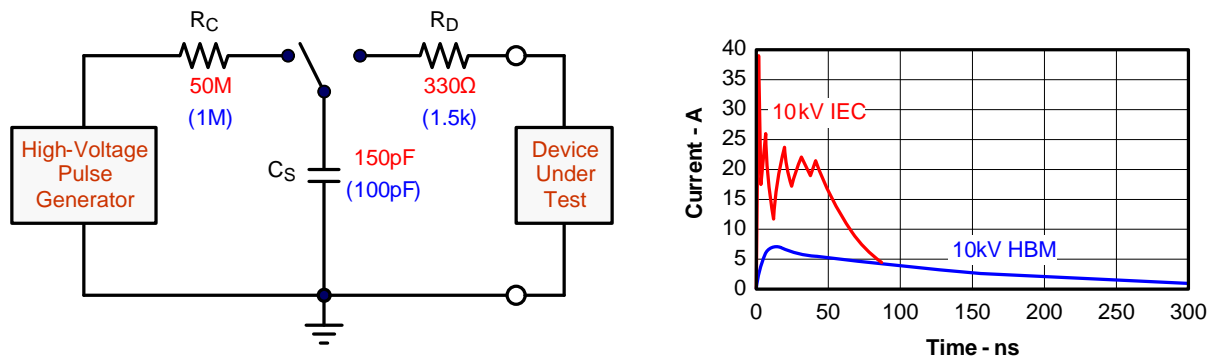

The input sensitivity of a standard RS-485 transceiver is ±200 mV. When the differential input voltage, V_{ID} , is greater than +200 mV, the receiver output turns high, for $V_{ID} < -200$ mV the receiver outputs low.

The SN65HVD888 transceiver implements high receiver noise-immunity by providing a typical positive-going input threshold of 35 mV and a minimum hysteresis of 40 mV. In the case of a noisy input condition therefore, a differential noise voltage of up to 40 mV_{PP} can be present without causing the receiver output to change states from high to low.

9.1.7 Transient Protection

The bus terminals of the SN65HVD888 transceiver family possess on-chip ESD protection against ±16 kV HBM and ±12 kV IEC61000-4-2 contact discharge. The International Electrotechnical Commission (IEC) ESD test is far more severe than the HBM ESD test. The 50% higher charge capacitance, C_S , and 78% lower discharge resistance, R_D of the IEC model produce significantly higher discharge currents than the HBM model.

As stated in the IEC 61000-4-2 standard, contact discharge is the preferred transient protection test method. Although IEC air-gap testing is less repeatable than contact testing, air discharge protection levels are inferred from the contact discharge test results.

Copyright © 2016, Texas Instruments Incorporated

Figure 20. HBM and IEC-ESD Models and Currents in Comparison (HBM Values in Parenthesis)

The on-chip implementation of IEC ESD protection significantly increases the robustness of equipment. Common discharge events occur because of human contact with connectors and cables. Designers may choose to implement protection against longer duration transients, typically referred to as surge transients. Figure 12 suggests two circuit designs providing protection against short and long duration surge transients, in addition to ESD and Electrical Fast Transients (EFT) transients. Table 4 lists the bill of materials for the external protection devices.

EFTs are generally caused by relay-contact bounce or the interruption of inductive loads. Surge transients often result from lightning strikes (direct strike or an indirect strike which induce voltages and currents), or the switching of power systems, including load changes and short circuits switching. These transients are often encountered in industrial environments, such as factory automation and power-grid systems.

Figure 21 compares the pulse-power of the EFT and surge transients with the power caused by an IEC ESD transient. In the diagram on the left of Figure 21, the tiny blue blip in the bottom left corner represents the power of a 10-kV ESD transient, which already dwarfs against the significantly higher EFT power spike, and certainly dwarfs against the 500-V surge transient. This type of transient power is well representative of factory environments in industrial and process automation. The diagram on the right of Figure 21 compares the enormous power of a 6-kV surge transient, most likely occurring in e-metering applications of power generating and power grid systems, with the aforementioned 500-V surge transient.

NOTE

The unit of the pulse-power changes from kW to MW, thus making the power of the 500-V surge transient almost dropping off the scale.

Figure 21. Power Comparison of ESD, EFT, and Surge Transients

In the case of surge transients, high-energy content is signified by long pulse duration and slow decaying pulse power

The electrical energy of a transient that is dumped into the internal protection cells of the transceiver is converted into thermal energy. This thermal energy heats the protection cells and literally destroys them, thus destroying the transceiver. Figure 22 shows the large differences in transient energies for single ESD, EFT, and surge transients as well as for an EFT pulse train, commonly applied during compliance testing.

Figure 22. Comparison of Transient Energies

Table 4. Bill of Materials

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER
XCVR	5-V, 250-kbps RS-485 Transceiver	SN65HVD888	TI
R1, R2	10-Ω, Pulse-Proof Thick-Film Resistor	CRCW0603010RJNEAHP	Vishay
TVS	Bidirectional 400-W Transient Suppressor	CDSOT23-SM712	Bourns
TBU1, TBU2	Bidirectional.	TBU-CA-065-200-WH	Bourns

Figure 23. Transient Protections Against ESD, EFT, and Surge Transients

The left circuit shown in Figure 23 provides surge protection of ≥ 500 -V transients, while the right protection circuits can withstand surge transients of 5 kV.

9.2 Typical Application

Many RS-485 networks use isolated bus nodes to prevent the creation of unintended ground loops and their disruptive impact on signal integrity. An isolated bus node typically includes a micro controller that connects to the bus transceiver through a multi-channel, digital isolator (Figure 24).

A. See Table 4.

Figure 24. Isolated Bus Node With Transient Protection

9.2.1 Design Requirements

Example Application: Isolated Bus Node with Transient Protection

- RS-485-compliant bus interface (needs differential signal amplitude of at least 1.5 V under fully-loaded conditions – essentially, maximum number of nodes connected and with dual 120- Ω termination).
- Galvanic isolation of both signal and power supply lines.
- Able to withstand ESD transients up to 12 kV (per IEC 61000-4-2) and EFTs up to 4 kV (per IEC 61000-4-4).
- Full control of data flow on bus in order to prevent contention (for half-duplex communication).

9.2.2 Detailed Design Procedure

Power isolation is accomplished using the push-pull transformer driver SN6501 and a low-cost LDO, TLV70733.

Signal isolation uses the quadruple digital isolator ISO7241. Notice that both enable inputs, EN1 and EN2, are pulled-up via 4.7-k Ω resistors to limit input currents during transient events.

While the transient protection is similar to the one in Figure 23 (left circuit), an additional high-voltage capacitor diverts transient energy from the floating RS-485 common further towards Protective Earth (PE) ground. This diversion is necessary as noise transients on the bus are usually referred to Earth potential.

R_{VH} refers to a high-voltage resistor, and in some applications even a varistor. This resistance is applied to prevent charging of the floating ground to dangerous potentials during normal operation.

Typical Application (continued)

Occasionally varistors are used instead of resistors in order to rapidly discharge C_{HV} , if expected that fast transients might charge C_{HV} to high-potentials.

Note that the PE island represents a copper island on the PCB for the provision of a short, thick Earth wire connecting this island to PE ground at the entrance of the power supply unit (PSU).

In equipment designs using a chassis, the PE connection is usually provided through the chassis itself. Typically the PE conductor is tied to the chassis at one end while the high-voltage components, C_{HV} and R_{HV} , are connecting to the chassis at the other end.

9.2.3 Application Curve

Figure 25. SN65HVD888 D Input (Top), Differential Output (Middle), and R Output (Bottom), 250 kbps Operation, PRBS Data Pattern

10 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, each supply should be decoupled with a 100-nF ceramic capacitor located as close to the supply pins as possible. This helps to reduce supply voltage ripple present on the outputs of switched-mode power supplies and also helps to compensate for the resistance and inductance of the PCB power planes.

11 Layout

11.1 Layout Guidelines

11.1.1 Design and Layout Considerations For Transient Protection

Because ESD and EFT transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high-frequency layout techniques must be applied during PCB design.

In order for PCB design to be successful, begin with the design of the protection circuit in mind.

1. Place the protection circuitry close to the bus connector to prevent noise transients from penetrating your board.
2. Use V_{CC} and ground planes to provide low-inductance. Note that high-frequency currents follow the path of least inductance and not the path of least impedance.
3. Design the protection components into the direction of the signal path. Do not force the transients currents to divert from the signal path to reach the protection device.
4. Apply 100- to 220-nF bypass capacitors as close as possible to the V_{CC} -pins of transceiver, UART, controller ICs on the board.
5. Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize effective via-inductance.
6. Use 1- to 10-k pullup or pulldown resistors for enable lines to limit noise currents in these lines during transient events.
7. Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus terminals. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
 - While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few-hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to some 200 mA.

13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65HVD888D	ACTIVE	SOIC	D	8	75	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	HVD888	Samples
SN65HVD888DR	ACTIVE	SOIC	D	8	2500	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	HVD888	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
