3 概要

この 1 ビット非反転バス トランシーバは、設定可能な 2 本の独立した電源レールを使用します。A ポートは V_{CCA} に追従するように設計されています。V_{CCA} ピンには、1.65V ~5.5V の電源電圧を入力できます。B ポートは、V_{CCB} に追従する設計になっています。V_{CCB} ピンには、1.65V ~5.5V の電源電圧を入力できます。これにより、1.8V、2.5V、3.3V、5V の任意の電圧ノード間での低電圧双方向変換が可能です。

SN74LVC1T45 は、2 つのデータ バス間の非同期通信用に設計されています。方向制御 (DIR) 入力のロジックレベルにより、B ポート出力と A ポート出力のどちらかがアクティブになります。本デバイスは、B ポート出力をアクティブにした場合、A バスから B バスにデータを送信し、A ポート出力をアクティブにした場合、B バスから A バスにデータを送信します。A ポートと B ポートの両方の入力回路は常にアクティブであるため、I_{CC} と I_{CCB} が過剰に流れないようにロジック High または Low レベルを印加する必要があります。

SN74LVC1T45 は、DIR 入力 が V_{CCA} によって給電されるように設計されています。このデバイスは、I_{off} を使用する部分的パワーダウン アプリケーション用の動作が完全に規定されています。I_{off} 回路で出力をディセーブルすることにより、電源切断時にデバイスに電流が逆流して損傷するのを回避できます。V_{CC} 絶縁機能は、いずれかの V_{CC} 入力 が GND レベルになると、両方のポートがハイインピーダンス状態になるよう設計されています。

ダイをパッケージとして使用する NanoFree™ パッケージ技術は、IC パッケージの概念を大きく覆すものです。

7 Detailed Description

7.1 Overview

The SN74LVC1T45 is a single-bit, dual-supply, noninverting voltage level transceiver. Pin A and the direction control pin (DIR) are supported by V_{CCA} and pin B is supported by V_{CCB} . The A port is able to accept I/O voltages ranging from 1.65V to 5.5V, while the B port can accept I/O voltages from 1.65V to 5.5V. The high on the DIR allows data transmissions from A to B and a low on the DIR allows data transmissions from B to A.

7.2 Functional Block Diagram

7-1. Logic Diagram (Positive Logic)

7.3 Feature Description

7.3.1 Fully Configurable Dual-Rail Design Allows Each Port to Operate Over the Full 1.65V to 5.5V Power-Supply Range

Both V_{CCA} and V_{CCB} can be supplied at any voltage between 1.65V and 5.5V, making the device suitable for translating between any of the voltage nodes (1.8V, 2.5V, 3.3V, and 5V).

7.3.2 Support High Speed Translation

The SN74LVC1T45 device supports high data rate applications. The translated signal data rate can be up to 420Mbps when the signal is translated from 3.3V to 5V.

7.3.3 I_{off} Supports Partial Power-Down Mode Operation

The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by I_{off} in the [Electrical Characteristics](#).

7.3.4 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads so impedance matching and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. Two outputs can be connected together for a stronger output drive strength. The electrical and thermal limits defined in the [Absolute Maximum Ratings](#) must be followed at all times.

7.3.5 Glitch-Free Power Supply Sequencing

Either supply rail may be powered on or off in any order without producing a glitch on the I/Os (that is, where the output erroneously transitions to VCC when it should be held low or vice versa). Glitches of this nature can be misinterpreted by a peripheral as a valid data bit, which could trigger a false device reset of the peripheral, a false device configuration of the peripheral, or even a false data initialization by the peripheral.

7.3.6 V_{CC} Isolation

The I/Os of both ports will enter a high-impedance state when either of the supplies are at GND, while the other supply is still connected to the device. The maximum leakage into or out of any input or output pin on the device is specified by I_{off} in the *Electrical Characteristics*.

8.1 Application Information

The SN74LVC1T45 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The maximum data rate can be up to 420Mbps when device translates signals from 3.3V to 5V.

8.2 Typical Application

8.2.1 Unidirectional Logic Level-Shifting Application

図 8-1 shows an example of the SN74LVC1T45 being used in a unidirectional logic level-shifting application.

図 8-1. Unidirectional Logic Level-Shifting Application

8.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 8-1.

表 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	1.65V to 5.5V
Output voltage range	1.65V to 5.5V

8.2.1.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
 - Use the supply voltage of the device that is driving the SN74LVC1T45 device to determine the input voltage range. For a valid logic high the value must exceed the V_{IH} of the input port. For a valid logic low the value must be less than the V_{IL} of the input port.
- Output voltage range
 - Use the supply voltage of the device that the SN74LVC1T45 device is driving to determine the output voltage range.

8.2.1.3 Application Curve

図 8-2. Translation Up (1.8V to 5V) at 2.5 MHz

8.2.2 Bidirectional Logic Level-Shifting Application

図 8-3 shows the SN74LVC1T45 being used in a bidirectional logic level-shifting application. Because the SN74LVC1T45 does not have an output-enable (OE) pin, the system designer should take precautions to avoid bus contention between SYSTEM-1 and SYSTEM-2 when changing directions.

図 8-3. Bidirectional Logic Level-Shifting Application

8.2.2.1 Design Requirements

8.2.2.2 Detailed Design Procedure

表 8-2 shows data transmission from SYSTEM-1 to SYSTEM-2 and then from SYSTEM-2 to SYSTEM-1.

表 8-2. SYSTEM-1 and SYSTEM-2 Data Transmission (続き)

4	L	In	Out	SYSTEM-2 data to SYSTEM-1

(1) SYSTEM-1 and SYSTEM-2 must use the same conditions, that is, both pullup or both pulldown.

8.2.2.2.1 Enable Times

Calculate the enable times for the SN74LVC1T45 using the following formulas:

- $t_{PZH} \text{ (DIR to A)} = t_{PLZ} \text{ (DIR to B)} + t_{PLH} \text{ (B to A)}$
- $t_{PZL} \text{ (DIR to A)} = t_{PHZ} \text{ (DIR to B)} + t_{PHL} \text{ (B to A)}$
- $t_{PZH} \text{ (DIR to B)} = t_{PLZ} \text{ (DIR to A)} + t_{PLH} \text{ (A to B)}$
- $t_{PZL} \text{ (DIR to B)} = t_{PHZ} \text{ (DIR to A)} + t_{PHL} \text{ (A to B)}$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the SN74LVC1T45 initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.

8.2.2.3 Application Curve

8.3 Power Supply Recommendations

Always apply a ground reference to the GND pins first. This device is designed for glitch free power sequencing without any supply sequencing requirements such as ramp order or ramp rate.

This device was designed with various power supply sequencing methods in mind to help prevent unintended triggering of downstream devices, as described in [Glitch-free Power Supply Sequencing](#).

8.4 Layout

8.4.1 Layout Guidelines

To ensure reliability of the device, the following common printed-circuit board layout guidelines are recommended:

- Bypass capacitors should be used on power supplies.
- Short trace lengths should be used to avoid excessive loading.
- Placing pads on the signal paths for loading capacitors or pullup resistors to help adjust rise and fall times of signals depends on the system requirements

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
 - Maximum stencil thickness 0,127 mm (5 mils). All linear dimensions are in millimeters.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Side aperture dimensions over-print land for acceptable area ratio > 0.66. Customer may reduce side aperture dimensions if stencil manufacturing process allows for sufficient release at smaller opening.
