TAA5212 118dB のダイナミック レンジ、低消費電力、高性能 ステレオ オーディオ ADC

ADVANCE INFORMATION

1 特長

- ADC チャネル
  - ステレオ高性能 ADC
  - 性能:
    - ライン差動入力のダイナミック レンジ:118dB
    - マイクロフォン差動入力のダイナミック レンジ:118dB
    - THD+N:-95dB
    - チャネル加算モードで高 SNR をサポート
  - 入力電圧:
    - 差動、$2V_{RMS}$ フルスケール入力
    - シングルエンド、$1V_{RMS}$ フルスケール入力
  - 入力ミックス / マルチプレクサ オプション
  - サンプル レート (f_S) = 8kHz～768kHz
  - プログラム可能なマイクロフォン バイアス (最大 3V)
- 共通機能
  - 最大 4 つのレコード チャネル
    - 2 チャネル アナログ + 2 チャネル デジタル
    - 1 チャネル アナログ + 3 チャネル デジタル
    - 4 チャネル デジタル
  - 音声アクティビティ検出
  - 低レイテンシ フィルタ選択
  - プログラム可能で HPF およびバイクワッド フィルタ
  - I^2C & SPI 制御インターフェイス
  - オーディオ シリアル インターフェイス
    - フォーマット:TDM、I^2S、または左揃え
    - ワード長:16、20、24 または 32 ビット
  - プログラム可能な PLL による柔軟なクロック供給
  - 低消費電力モード
    - レコードの未定 mW
  - 単電源動作 1.8V または 3.3V
  - I/O 電源動作:1.2V、1.8V、または 3.3V
  - 温度グレード 1:-40°C ≤ T_A ≤ +125°C

2 アプリケーション

- 陸上モバイル無線
- IP ネットワーク カメラ
- IP 電話
- テレビ会議システム
- 業務用オーディオ ミキサ / 制御卓

3 概要

TAA5212 は、$2V_{RMS}$ 差動入力、118dB ADC を備えた高性能 ステレオ ADC です。TAA5212 は、差動入力とシングルエンド入力の両方をサポートしています。このデバイスは、マイクロフォンとライン入力の両方の入力を、ADC チャネルで AC および DC 結合オプションによりサポートしています。TAA5212 は、プログラム可能なチャネル ゲイン、デジタル音量制御、低ジッタの位相ロック ループ (PLL)、プログラム可能なハイパス フィルタ (HPF)、プログラム可能な EQ およびバイクワッド フィルタ、低レイテンシのフィルタ モード、を内蔵しており、最高 768kHz のサンプル レートに対応できます。TAA5212 は時分割多重化 (TDM)、I^2S、または左揃え (LJ) オーディオ フォーマットに対応しており、I^2C または SPI で制御できます。これらの高性能な機能を搭載し、単一電源で動作するので、TAA5212 はスペースの制約が厳しいオーディオ アプリケーションに最適です。

6 Specifications

6.1 Absolute Maximum Ratings

over the operating ambient temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Supply voltage	AVDD to AVSS	–0.3	3.9	V
Supply voltage	IOVDD to VSS (thermal pad)	–0.3	3.9	V
Ground voltage differences	AVSS to VSS (thermal pad)	–0.3	0.3	V
Analog input voltage	Analog input pins voltage to AVSS	–0.3	5.656	V
Digital input voltage	Digital input pins voltage to VSS (thermal pad)	–0.3	IOVDD + 0.3	V
Temperature	Functional ambient, T_A	-55	125	°C
	Operating ambient, T_A	–40	125	
	Junction, T_J	–40	150	
	Storage, T_{stg}	–65	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002(1)	±2000	V
$V_{(ESD)}$	Electrostatic discharge	Charged-device model (CDM), per AEC Q100-011	±500	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
POWER					
AVDD(1)	Analog supply voltage to AVSS AVDD-3.3V Operation	3.0	3.3	3.6	V
AVDD(1)	Analog supply voltage to AVSS - AVDD 1.8V operation	1.65	1.8	1.95	V
IOVDD	IO supply voltage to VSS (thermal pad) - IOVDD 3.3-V operation	3.0	3.3	3.6	V
	IO supply voltage to VSS (thermal pad) - IOVDD 1.8-V operation	1.65	1.8	1.95	
IOVDD	IO supply voltage to VSS (thermal pad) - IOVDD 1.2-V operation	1.08	1.2	1.32	V
INPUTS					
INxx	Analog input pins voltage to AVSS for line-in recording	0		5.6	V
INxx	Analog input pins voltage to AVSS for microphone recording	0.1		MICBIAS – 0.1	V
	Digital input pins voltage to VSS (thermal pad)	0		IOVDD	V
ADDR	ADDR pin w.r.t AVSS	0		AVDD	V
TEMPERATURE					
T_A	Operating ambient temperature	–40		125	°C

ADVANCE INFORMATION

		MIN	NOM	MAX	UNIT
OTHERS					
	GPIOx or GPIx (used as MCLK input) clock frequency			36.864(2)	MHz
C_b	SCL and SDA bus capacitance for I^2C interface supports standard-mode and fast-mode			400	pF
	SCL and SDA bus capacitance for I^2C interface supports fast-mode plus			550	
C_L	Digital output load capacitance		20	50	pF

(1) AVSS and VSS (thermal pad); all ground pins must be tied together and must not differ in voltage by more than 0.2 V.
(2) MCLK input rise time (V_{IL} to V_{IH}) and fall time (V_{IH} to V_{IL}) must be less than 5 ns. For better audio noise performance, MCLK input must be used with low jitter.

6.4 Thermal Information

THERMAL METRIC(1)		TAA5212 RGE (WQFN) 28 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	38.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	26.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	15.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter	15.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	13.8	°C/W

(1) Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the AC signal input shorted to ground, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
(2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter can result in higher THD and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, can affect dynamic specification values.

8 Detailed Description

8.1 Overview

The TAA5212 is from a scalable family of devices. As part of the extended family of devices, the TAA5212 consists of a high-performance, low-power, flexible, mono/stereo, audio analog-to-digital converter (ADC). This device is intended for applications such as ruggedized communication equipment, IP network camera, Professional Audio and multimedia applications. The high dynamic range of this device enables far-field audio recording with high fidelity. This device integrates a host of features that reduce cost, board space, and power consumption in space-constrained system designs. Package, performance, and compatible configuration registers across extended family make this device well suited for scalable system designs.

The TAA5212 consists of the following blocks:

- 2-channel, multibit, high-performance delta-sigma (ΔΣ) ADCs
- Configurable single-ended or differential audio inputs with 2Vrms signal swing
- Low-noise programmable microphone bias output
- Automatic gain controller (AGC)
- Programmable Decimation filters with linear-phase or low-latency filter
- Programmable channel gain, volume control, and biquad filters for each channel
- Programmable phase and gain calibration with fine resolution for each channel
- Programmable High-pass filter (HPF) and digital channel mixer
- Pulse density modulation (PDM) digital microphone interface with high-performance decimation filter
- Dual I^2S or TDM Interface with Independent Sample Rate(Synchronous)
- Synchronous Sample Rate Converter(SRC)
- Integrated low-jitter, phase-locked loop (PLL) supporting a wide range of system clocks
- Integrated digital and analog voltage regulators to support single-supply operation

Communication to the TAA5212 for configuring the control registers is supported using an I^2C and SPI interface. The device supports a highly flexible audio serial interface [time-division multiplexing (TDM), I^2S, or left-justified (LJ)] to transmit audio data seamlessly in the system across devices.

8.3 Feature Description

8.3.1 Hardware Control

The device supports simple hardware-pin-controlled options to select a specific mode of operation and audio interface for a given system. The MD0 to MD6 pins allow the device to be controlled by either pullup or pulldown resistors.

8.3.2 Serial Interfaces

This device has two serial interfaces: control and audio data. The control serial interface is used for device configuration. The audio data serial interface is used for transmitting audio data to the host device.

8.3.2.1 Control Serial Interfaces

The device contains configuration registers and programmable coefficients that can be set to the desired values for a specific system and application use. All these registers can be accessed using either I^2C or SPI communication to the device. For more information, see the *セクション 8.5* section.

8.3.2.2 Audio Serial Interfaces

Digital audio data flows between the host processor and the TAA5212 on the digital audio serial interface (ASI), or audio bus. This highly flexible ASI bus includes a TDM mode for multichannel operation, support for I^2S or left-justified protocols format, programmable data length options, very flexible controller-target configurability for bus clock lines and the ability to communicate with multiple devices within a system directly.

The TAA5212 supports up to two ASI Interfaces. Secondary ASI Clock and Data Pins can be configured by setting GPIO's. Frame Sync of two ASI's must be synchronous. See the for more details on Secondary ASI.

The bus protocol TDM, I²S, or left-justified (LJ) format can be selected for primary ASI by using the PASI_FORMAT[1:0], P0_R26_D[7:6] register bits. As shown in 表 8-1 and .表 8-2, these modes are all most significant byte (MSB)-first, pulse code modulation (PCM) data format, with the output channel data word-length programmable as 16, 20, 24, or 32 bits by configuring the PASI_WLEN[1:0], P0_R26_D[5:4] register bits.

表 8-1. Primary Audio Serial Interface Format

P0_R26_D[7:6] : PASI_FORMAT[1:0]	PRIMARY AUDIO SERIAL INTERFACE FORMAT
00 (default)	Time division multiplexing (TDM) mode
01	Inter IC sound (I²S) mode
10	Left-justified (LJ) mode
11	Reserved (do not use this setting)

表 8-2. Primary Audio Serial Interface Data Word-Length

P0_R7_D[5:4] : PASI_WLEN[1:0]	PRIMARY AUDIO OUTPUT CHANNEL DATA WORD-LENGTH
00	Data word-length set to 16 bits
01	Data word-length set to 20 bits
10	Data word-length set to 24 bits
11 (default)	Data word-length set to 32 bits

The frame sync pin, FSYNC, is used in this audio bus protocol to define the beginning of a frame and has the same frequency as the output data sample rates. The bit clock pin, BCLK, is used to clock out the digital audio data across the serial bus. The number of bit-clock cycles in a frame must accommodate multiple device active output channels with the programmed data word length.

A frame consists of multiple time-division channel slots (up to 32) to allow all input/output channel audio data transmissions to complete on the audio bus by a device or multiple devices sharing the same audio bus. The device supports up to eight input channels and eight output channels that can be configured on primary ASI bus to place their audio data on bus slot 0 to slot 31. 表 8-3 lists the output channel-1 slot configuration settings. In I²S and LJ mode, the slots are divided into two sets, left-channel slots and right-channel slots, as described in the *セクション 8.3.2.2.2* and *セクション 8.3.2.2.3* sections.

表 8-3. Output Channel-1 Slot Assignment Settings

P0_R30_D[4:0] : PASI_TX_CH1_SLOT[4:0]	OUTPUT CHANNEL 1 SLOT ASSIGNMENT
0 0000 = 0d (default)	Slot 0 for TDM or left slot 0 for I²S, LJ.
0 0001 = 1d	Slot 1 for TDM or left slot 1 for LJ.
…	…
0 1111 = 15d	Slot 15 for TDM or left slot 15 for LJ.
1 0000 = 32d	Slot 16 for TDM or right slot 0 for I²S, LJ.
…	…
1 1110 = 30d	Slot 30 for TDM or right slot 14 for LJ.
1 1111 = 31d	Slot 31 for TDM or right slot 15 for LJ.

Similarly, the slot assignment setting for output channel 2 to channel 8 can be done using the PASI_TX_CH2_SLOT (P0_R31) to PASI_TX_CH8_SLOT (P0_R37) registers and for input channel 1 to channel 8 by using the PASI_RX_CH1_SLOT(P0_R40) to PAS_RX_CH8_SLOT(P0_R47), respectively.

The slot word length is the same as the primary ASI channel word length set for the device. The output channel data word length must be set to the same value for all TAA5212 devices if all devices share the same ASI bus in a system. The maximum number of slots possible for the ASI bus in a system is limited by the available bus bandwidth, which depends upon the BCLK frequency, output data sample rate used, and the channel data word length configured.

ADVANCE INFORMATION

The device also includes a feature that offsets the start of the slot data transfer with respect to the frame sync by up to 31 cycles of the bit clock. Offset can be configured independently for input and output data paths. 表 8-4 and 表 8-5lists the programmable offset configuration settings for transmission and receive paths respectively.

表 8-4. Programmable Offset Settings for the ASI Slot Start for transmission

0 0000 = 0d (default)	The device follows the standard protocol timing without any offset.
0 0001 = 1d	Slot start is offset by one BCLK cycle, as compared to standard protocol timing. For I²S or LJ, the left and right slot start is offset by one BCLK cycle, as compared to standard protocol timing.
.....	.....
1 1110 = 30d	Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I²S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing.
1 1111 = 31d	Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I²S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing.

表 8-5. Programmable Offset Settings for the ASI Slot Start for Receive

P0_R38_D[4:0] : PASI_RX_OFFSET[4:0]	PROGRAMMABLE OFFSET SETTING FOR SLOT DATA RECEIVE START
0 0000 = 0d (default)	The device follows the standard protocol timing without any offset.
0 0001 = 1d	Slot start is offset by one BCLK cycle, as compared to standard protocol timing. For I²S or LJ, the left and right slot start is offset by one BCLK cycle, as compared to standard protocol timing.
.....	.....
1 1110 = 30d	Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I²S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing.
1 1111 = 31d	Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I²S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing.

The device also features the ability to invert the polarity of the frame sync pin, FSYNC, used to transfer the audio data as compared to the default FSYNC polarity used in standard protocol timing. This feature can be set using the PASI_FSYNC_POL, P0_R26_D3 register bit. Similarly, the device can invert the polarity of the bit clock pin, BCLK, which can be set using the PASI_BCLK_POL, P0_R26_D2 register bit.

In addition, the word clock and bit clock can be independently configured in either Controller or Target mode, for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame, and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC sampling frequencies.

8.3.2.2.1 Time Division Multiplexed Audio (TDM) Interface

In TDM mode, also known as DSP mode, the rising edge of FSYNC starts the data transfer with the slot 0 data first. Immediately after the slot 0 data transmission, the remaining slot data are transmitted in order. FSYNC and each data bit (except the MSB of slot 0 when TX_OFFSET equals 0) is transmitted on the rising edge of BCLK. 図 8-2 to 図 8-5 illustrate the protocol timing for TDM operation with various configurations.

ADVANCE INFORMATION

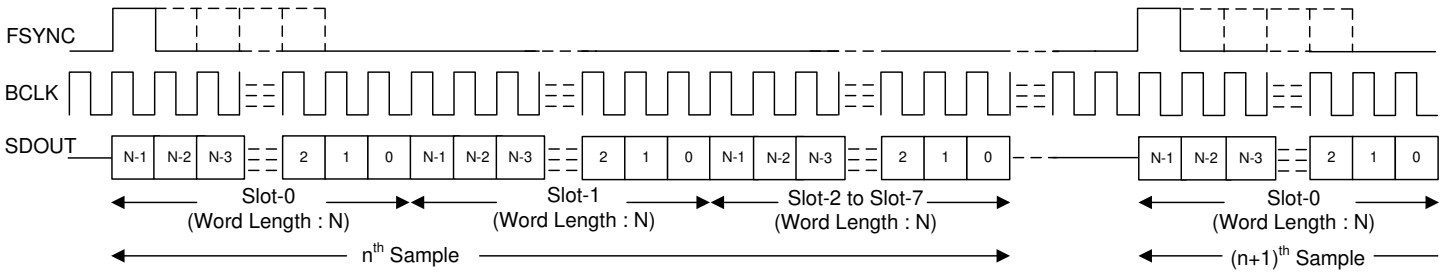

図 8-2. TDM Mode Standard Protocol Timing (PASI_TX_OFFSET = 0)

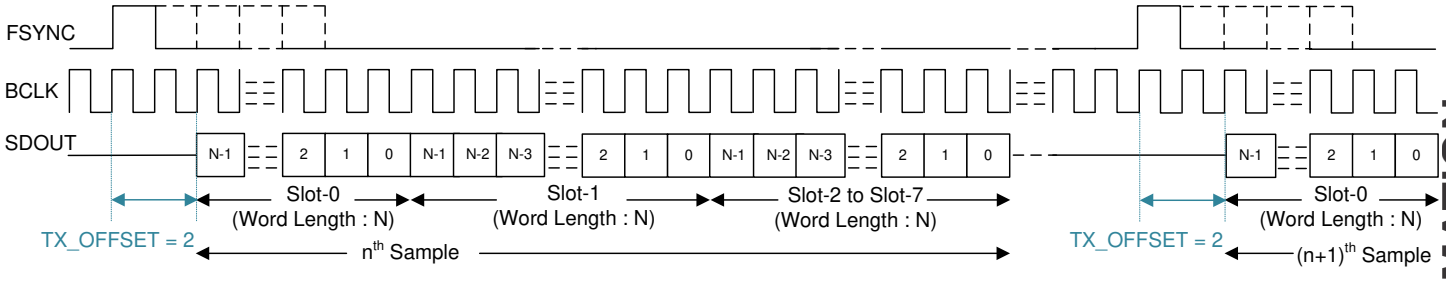

図 8-3. TDM Mode Protocol Timing (PASI_TX_OFFSET = 2)

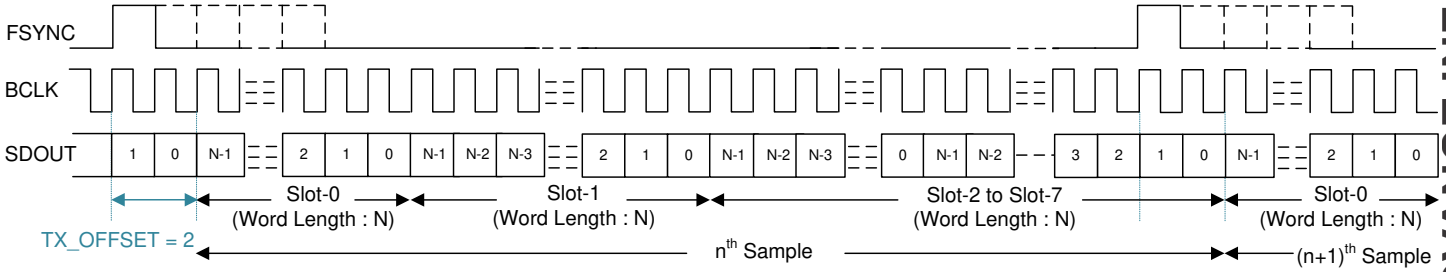

図 8-4. TDM Mode Protocol Timing (No Idle BCLK Cycles, PASI_TX_OFFSET = 2)

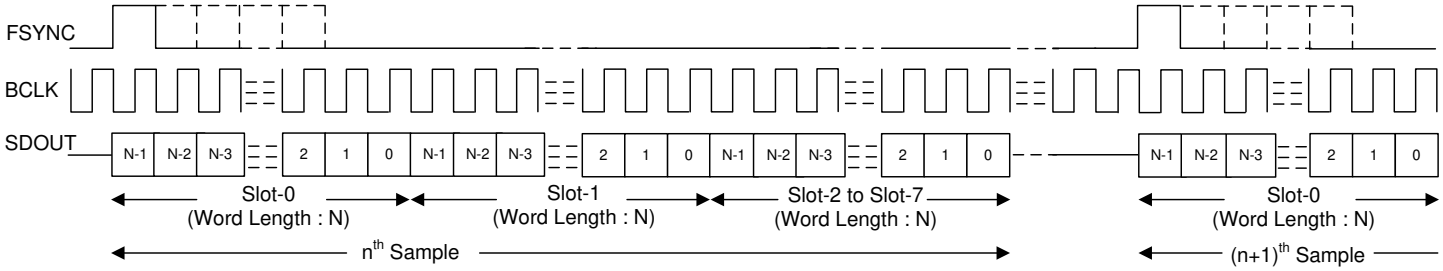

図 8-5. TDM Mode Protocol Timing (PASI_TX_OFFSET = 0 and PASI_BCLK_POL = 1)

For proper operation of the audio bus in TDM mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels times the programmed word length of the output channel data. The device supports FSYNC as a pulse with a 1-cycle-wide bit clock, but also supports multiples as well. For a higher BCLK frequency operation, using TDM mode with a PASI_TX_OFFSET value higher than 0 is recommended.

8.3.2.2.2 Inter IC Sound (I^2S) Interface

The standard I^2S protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In I^2S mode, the MSB of the left slot 0 is transmitted on the falling edge of BCLK in the second cycle after the *falling* edge of FSYNC. Immediately after the left slot 0 data transmission, the

ADVANCE INFORMATION

remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted on the falling edge of BCLK in the second cycle after the *rising* edge of FSYNC. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC and each data bit is transmitted on the falling edge of BCLK. 図 8-6 to 図 8-9 illustrate the protocol timing for I²S operation with various configurations.

of the output channel data. The device FSYNC low pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC high pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured.

8.3.2.2.3 Left-Justified (LJ) Interface

The standard LJ protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In LJ mode, the MSB of the left slot 0 is transmitted in the same BCLK cycle after the *rising* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted in the same BCLK cycle after the *falling* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC is transmitted on the falling edge of BCLK. 図 8-10 to 図 8-13 illustrate the protocol timing for LJ operation with various configurations.

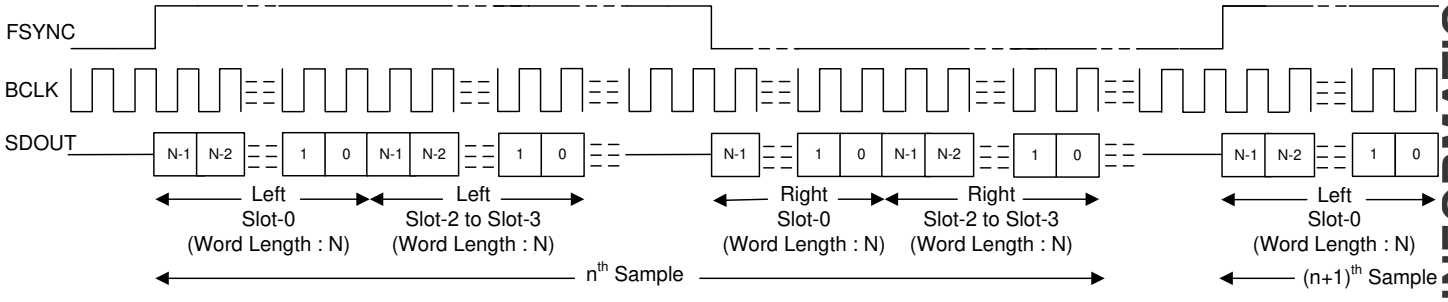

図 8-10. LJ Mode Standard Protocol Timing (TX_OFFSET = 0)

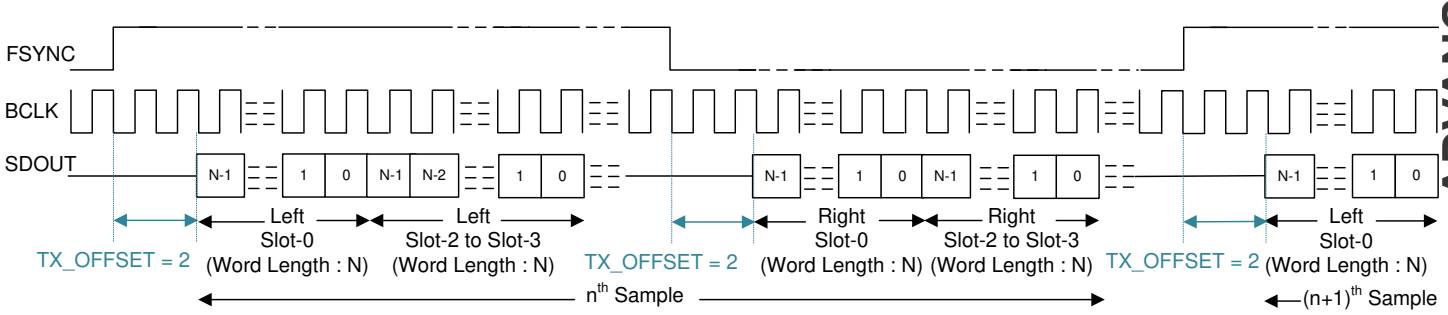

図 8-11. LJ Protocol Timing (TX_OFFSET = 2)

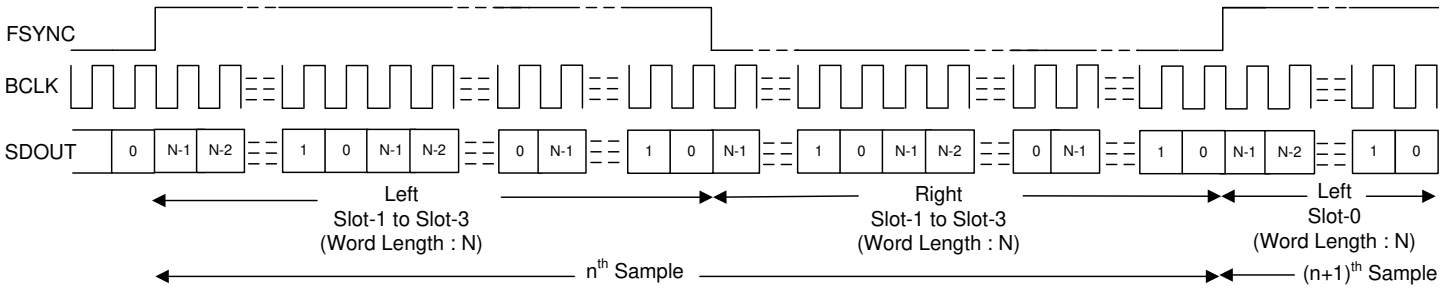

図 8-12. LJ Protocol Timing (No Idle BCLK Cycles, TX_OFFSET = 0)

ADVANCE INFORMATION

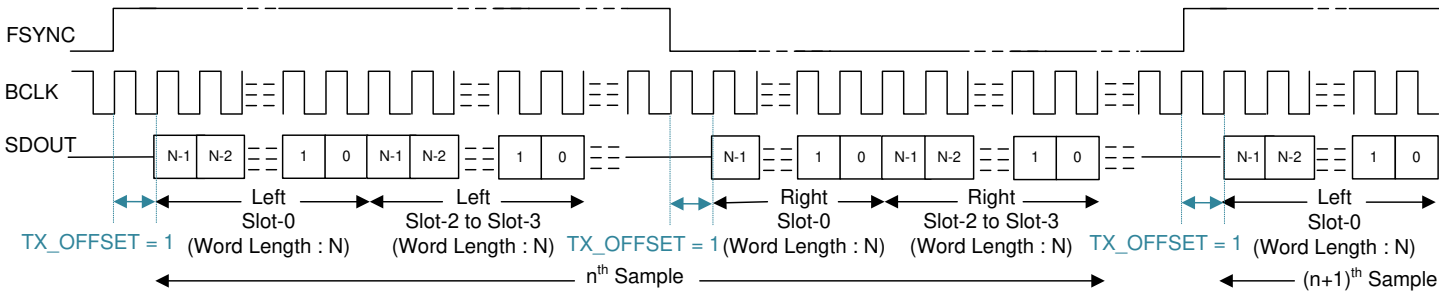

図 8-13. LJ Protocol Timing (TX_OFFSET = 1 and BCLK_POL = 1)

For proper operation of the audio bus in LJ mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC high pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC low pulse must be number of BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured. For a higher BCLK frequency operation, using LJ mode with a TX_OFFSET value higher than 0 is recommended.

8.3.2.3 Using Multiple Devices With Shared Buses

The device has many supported features and flexible options that can be used in the system to seamlessly connect multiple TAA5212 devices by sharing a single common I²C or SPI control bus and an audio serial interface bus. This architecture enables multiple applications to be applied to a system that require a microphone or speaker array for beam-forming operation, audio conferencing, noise cancellation, and so forth. 図 8-14 shows a diagram of multiple TAA5212 devices in a configuration where the control and audio data buses are shared.

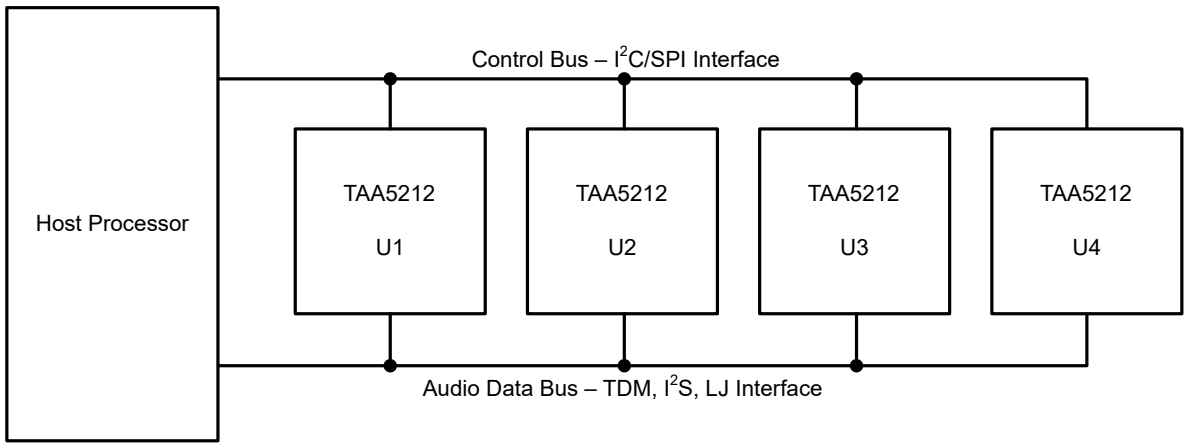

図 8-14. Multiple TAA5212 Devices With Shared Control and Audio Data Buses

The TAA5212 consists of the following features to enable seamless connection and interaction of multiple devices using a shared bus:

- Supports up to four pin-programmable I²C target addresses
- I²C broadcast simultaneously writes to (or triggers) all TAA5212 devices
- Supports up to 32 configuration input/output channel slots for the audio serial interface
- Tri-state feature (with enable and disable) for the unused audio data slots of the device
- Supports a bus-holder feature (with enable and disable) to keep the last driven value on the audio bus
- The GPIOx, GPI1 or GPO1 pin can be configured as a secondary input/output data lane or as a secondary audio serial interface

ADVANCE INFORMATION

- The GPIOx, GPI1 or GPO1 pin can be used in a daisy-chain configuration of multiple TAA5212 devices
- Supports one BCLK cycle data latching timing to relax the timing requirement for the high-speed interface
- Programmable controller and target options for both primary and secondary audio serial interface
- Ability to synchronize the multiple devices for the simultaneous sampling requirement across devices

See the *Multiple TAC5x1x Devices With a Shared TDM and I²C/SPI Bus* application report for further details.

ADVANCE INFORMATION

8.3.3 Phase-Locked Loop (PLL) and Clock Generation

The device has a smart auto-configuration block to generate all necessary internal clocks required for the ADC modulator and the digital filter engine used for signal processing. This configuration is done by monitoring the frequency of the FSYNC and BCLK signal on the audio buses.

The device supports the various data sample rates (of the FSYNC signal frequency) and the BCLK to FSYNC ratio to configure all clock dividers, including the PLL configuration, internally without host programming. 表 8-6 and 表 8-7 list the supported FSYNC and BCLK frequencies.

The TAA5212 also supports non-Audio sample rates beyond those listed in prior tables. Refer to Configuring Non-Audio Sample Rates for TAC5x1x devices for more details.

The TAA5212 sample rate can be configured using registers CLK_DET0 (P0_R62) and CLK_DET1 (P0_R63) for primary and secondary ASI respectively. These registers also capture the device auto detect result for the

FSYNC frequency in auto detection mode. The registers CLK_DET2 (P0_R64) and CLK_DET3 (P0_R65) capture the BCLK to FSYNC ratio detected of the device . If the device finds any unsupported combinations of FSYNC frequency and BCLK to FSYNC ratios, the device generates an ASI clock-error interrupt and mutes all the channels accordingly.

The TAA5212 also supports enabling channels while some ADC channels are already in operation. This requires a pre-configuration before power to describe maximum number of channels which can be enabled while in opeartion to ensure proper clock generation and use. This can be configured by using register DYN_PUPD_CFG (P0_R119). ADC_DYN_PUPD_EN bit can be used to enable ADC channels dynamic power up. Number of channels can be configured using ADC_DYN_MAXCH_SEL bit.

The device uses an integrated, low-jitter, phase-locked loop (PLL) to generate internal clocks required for the modulators and digital filter engine, as well as other control blocks. The device also supports an option to use BCLK, GPIOx, or the GPI1 pin (as CCLK) as the audio clock source without using the PLL to reduce power consumption. However, the ADC performance may degrade based on jitter from the external clock source, and some processing features may not be supported if the external audio clock source frequency is not high enough. Therefore, TI recommends using the PLL for high-performance applications. More details and information on how to configure and use the device in low-power mode without using the PLL are discussed in the *TAC5x1x Power Consumption Matrix Across Various Usage Scenarios* application report.

The device also supports an audio bus controller mode operation using the GPIOx or GPI1 pin (as CCLK) as the reference input clock source and supports various flexible options and a wide variety of system clocks. More details and information on controller mode configuration and operation are discussed in the *Configuring and Operating TAC5x1x as an Audio Bus Controller* application report.

The audio bus clock error detection and auto-detect feature automatically generates all internal clocks, but can be disabled using the IGNORE_CLK_ERR (P0_R4_D6) and CUSTOM_CLK_CFG (P0_R50_D0) register bits, respectively. In the system, this disable feature can be used to support custom clock frequencies that are not covered by the auto detect scheme. For such application use cases, care must be taken to ensure that the multiple clock dividers are all configured appropriately. Therefore, TI recommends using the PPC3 GUI for device configuration settings; for more details see the *TAC5212EVM-PDK Evaluation module* user's guide and the PurePath™ console graphical development suite.

8.3.4 Input Channel Configurations

The device consists of two pairs of analog input pins (INxP and INxM) that can be configured as differential inputs or single-ended inputs for the recording channel. The device supports simultaneous recording of up to two channels using the high-performance multichannel ADC. The input source for the analog pins can be from electret condenser analog microphones, microelectrical-mechanical system (MEMS) analog microphones, or line-in (auxiliary) inputs from the system board. Analog inputs support differential input, single-ended inputs(two pin and one-pin) with AC and DC coupling options. Additionally, if the application uses digital PDM microphones for the recording, GPIO,GPI and GPO pins can be reconfigured in the device to support up to four channels for the digital microphone recording. TAA5212 supports incremental mode of ADC where analog input channels can be used for DC measurements. This can be configured by setting IADC_EN(P0_R81_D7). 表 8-8 shows the input source selection for the record channel.

表 8-8. Input Source Selection for the Record Channel

P0_R80_D[7:6] : ADC_CH1_INSRC[1:0]	INPUT CHANNEL 1 RECORD SOURCE SELECTION
00 (default)	Analog differential input for channel 1
01	Analog single-ended Input for channel 1 (Signal on one input pin and Ground on other pin)
10	Analog single-ended Input on IN1P
11	Analog single-ended Input on IN1M

Similarly, the input source selection setting for input channel 2 can be configured using the ADC_CH2_INSRC[1:0] (P0_R85_D[7:6]) register bits.

ADVANCE INFORMATION

Typically, voice or audio signal inputs are capacitively coupled (AC-coupled) to the device; however, the device also supports an option for DC-coupled inputs to save board space. This configuration can be done independently for each channel by setting the input common mode tolerance in ADC_CH1_CM_TOL (P0_R60_D[3:2]), ADC_CH2_CM_TOL(P0_R85_D[3:2]) register bits. The INM pin can be directly grounded in Rail to Rail Common Mode (see 図 8-15), but the INM pin must be grounded after the AC-coupling capacitor whenever ADC_CHx_INSRC is set to 2'b01 and ADC_CHx_CM_TOL is set to 2'b01(see 図 8-16) for the single-ended input configuration. For the best dynamic range performance, the differential AC-coupled input must be used .

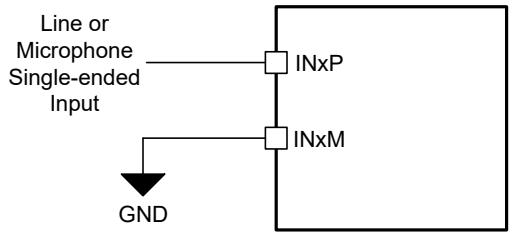

図 8-15. Single-Ended DC-Coupled Input Connection

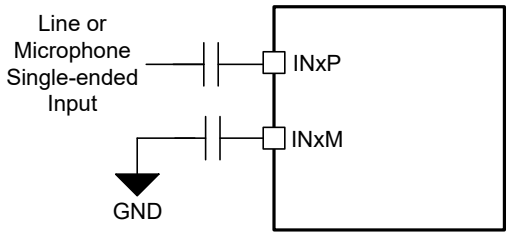

図 8-16. Single-Ended AC-Coupled Input Connection

The device allows for flexibility in choosing the typical input impedance on INxP or INxM from 5 kΩ (default), 10 kΩ, and 40 kΩ based on the input source impedance. The higher input impedance results in slightly higher noise or lower dynamic range. 表 8-9 lists the configuration register settings for the input impedance for the record channel.

表 8-9. Input Impedance Selection for the Record Channel

P0_R80_D[5:4] : ADC_CH1_IMP[1:0]	CHANNEL 1 INPUT IMPEDANCE SELECTION
00 (default)	Channel 1 input impedance typical value is 5 kΩ on INxP or INxM
01	Channel 1 input impedance typical value is 10 kΩ on INxP or INxM
10	Channel 1 input impedance typical value is 40 kΩ on INxP or INxM
11	Reserved (do not use this setting)

Similarly, the input impedance selection setting for input channel 2 can be configured using the ADC_CH2_IMP[1:0] (P0_R85_D[5:4]).

The value of the coupling capacitor in AC-coupled mode must be chosen so that the high-pass filter formed by the coupling capacitor and the input impedance do not affect the signal content. Before proper recording can begin, this coupling capacitor must be charged up to the common-mode voltage at power-up. To enable quick charging, the device has modes to speed up the charging of the coupling capacitor. The default value of the quick-charge timing is set for a coupling capacitor up to 1 µF. However, if a higher-value capacitor is used in the system, then the quick-charging timing can be increased by using the INCAP_QCHG (P0_R5_D[7:6]) register bits. For best distortion performance, use the low-voltage coefficient capacitors for AC coupling.

8.3.5 Reference Voltage

All audio data converters require a DC reference voltage. The TAA5212 achieves low-noise performance by internally generating a low-noise reference voltage. This reference voltage is generated using a band-gap circuit with high PSRR performance. This audio converter reference voltage must be filtered externally using a minimum 1-µF capacitor connected from the VREF pin to analog ground (VSS).

The value of this reference voltage can be configured using the P0_R77_D[1:0] register bits and must be set to an appropriate value based on the desired full-scale input for the device and the AVDD supply voltage available in the system. The default VREF value is set to 2.75 V, which in turn supports a 2-V_{RMS} differential full-scale input to the device. The required minimum AVDD voltage for this mode is 3 V. The TAA5212 also supports

ADVANCE INFORMATION

double swing mode with 4-V_{RMS} differential swing which can be enabled by setting ADC_CHx_FULLSCALE_VAL to 1. l 表 8-10 lists the various VREF settings supported along with required AVDD range and the supported full-scale input signal for that configuration.

表 8-10. VREF Programmable Settings

P0_R77_D[1:0] : VREF[1:0]	VREF OUTPUT VOLTAGE	DIFFERENTIAL FULL-SCALE INPUT SUPPORTED	SINGLE-ENDED FULL-SCALE INPUT SUPPORTED	AVDD RANGE REQUIREMENT
00 (default)	2.75 V	2 V_{RMS} (4 V_{RMS} supported in high swing mode)	1 V_{RMS}	3 V to 3.6 V
01	2.5 V	1.818 V_{RMS}	0.909 V_{RMS}	2.8 V to 3.6 V
10	1.375 V	1 V_{RMS}	0.5 V_{RMS}	1.7 V to 1.9 V
11	Reserved	Reserved	Reserved	Reserved

To achieve low-power consumption, this audio reference block is powered down as described in the *セクション 8.4* section. When exiting sleep mode, the audio reference block is powered up using the internal fast-charge scheme and the VREF pin settles to its steady-state voltage after the settling time (a function of the decoupling capacitor on the VREF pin). This time is approximately equal to 3.5 ms when using a 1-µF decoupling capacitor. If a higher-value decoupling capacitor is used on the VREF pin, the fast-charge setting must be reconfigured using the VREF_QCHG (P0_R2_D[4:3]) register bits, which support options of 3.5 ms (default), 10 ms, 50 ms, or 100 ms.

8.3.6 Programmable Microphone Bias

The device integrates a built-in, low-noise microphone bias pin that can be used in the system for biasing electret-condenser microphones or providing the supply to the MEMS analog or digital microphone. The integrated bias amplifier supports up to 10 mA of load current that can be used for multiple microphones and is designed to provide a combination of high PSRR, low noise, and programmable bias voltages to allow the biasing to be fine tuned for specific microphone combinations.

When using this MICBIAS pin for biasing or supplying to multiple microphones, avoid any common impedance on the board layout for the MICBIAS connection to minimize coupling across microphones. 表 8-11 shows the available microphone bias programmable options.

表 8-11. MICBIAS Programmable Settings

P0_R77_D[3:2] : MICBIAS_VAL[1:0]	P0_R77_D[1:0] : VREF_FSCALE[1:0]	MICBIAS OUTPUT VOLTAGE
00 (default)	00 (default)	2.75 V (same as the VREF output)
	01	2.5 V (same as the VREF output)
	10	1.375 V (same as the VREF output)
	11	Reserved (do not use these settings)
01	00 (default)	1.375 V (0.5 times the VREF output)
	01	1.250 V (0.5 times the VREF output)
	10 or 11	Reserved (do not use these settings)
10	XX	Reserved (do not use these settings)
11	XX	Same as AVDD

The microphone bias output can be powered on or powered off (default) by configuring the MICBIAS_PDZ, P0_R120_D5 register bit. Additionally, the device provides an option to configure the GPIO1 or GPIx pin to directly control the microphone bias output powering on or off. This feature is useful to control the microphone directly without engaging the host for I^2C or SPI communication. The MICBIAS_PDZ, P0_R120_D5 register bit value is ignored if the GPIO1 or GPIx pin is configured to set the microphone bias on or off.

8.3.7 Signal-Chain Processing

The TAA5212 signal chain is comprised of very-low-noise, high-performance, and low-power analog blocks and highly flexible and programmable digital processing blocks. The high performance and flexibility combined with a compact package makes the TAA5212 optimized for a variety of end-equipments and applications that require multichannel audio capture and playback. セクション 8.3.7.1 describe key components in ADC signal chain further.

8.3.7.1 ADC Signal-Chain

図 8-17 shows the key components of record path signal chain.

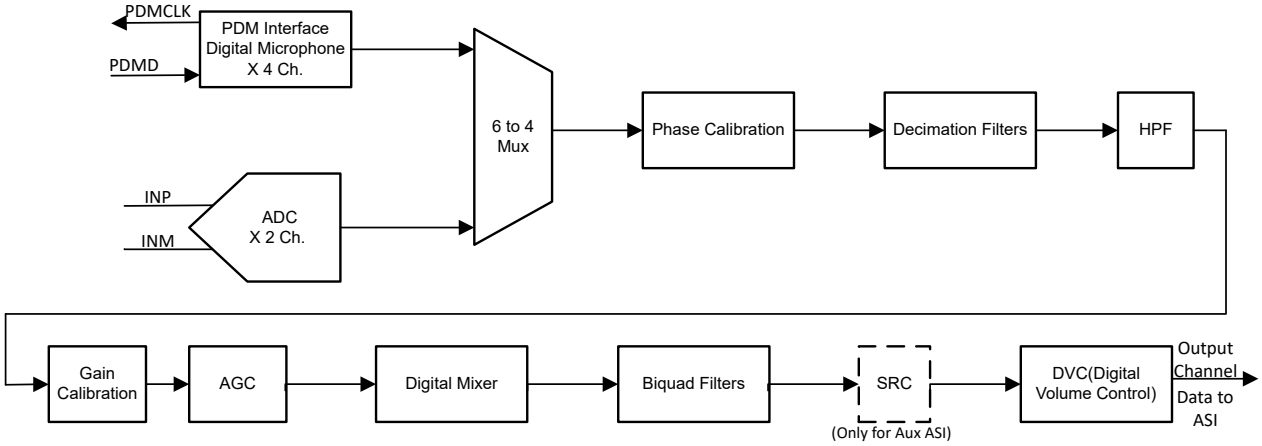

図 8-17. ADC Signal-Chain Processing Flowchart

The front-end ADC is very low noise, with a 115-dB dynamic range performance. This low-noise and low-distortion, multibit, delta-sigma ADC enables the TAA5212 to record a far-field audio signal with very high fidelity, both in quiet and loud environments. Moreover, the ADC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band during ADC sampling. Further on in the signal chain, an integrated, high-performance multistage digital decimation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The device also has an integrated programmable biquad filter that allows for custom low-pass, high-pass, or any other desired frequency shaping. Thus, the overall signal chain architecture removes the requirement to add external components for antialiasing low-pass filtering, and thus saves drastically on the external system component cost and board space. See the *TAC5212 Integrated Analog Antialiasing Filter and Flexible Digital Filter* application report for further details.

The signal chain also consists of various highly programmable digital processing blocks such as phase calibration, gain calibration, high-pass filter, digital summer or mixer, biquad filters, synchronous sample rate converter and volume control. The details on these processing blocks are discussed further in this section. The device also supports up to four digital PDM microphone recording channels when the analog record channels are not used.

The desired input channels for recording can be enabled or disabled by using the CH_EN (P0_R118) register, and the output channels for the audio serial interface can be enabled or disabled by using the ASI_TX_CHx_CFG register. In general, the device supports simultaneous power-up and power-down of all active channels for simultaneous recording. However, based on the application needs, if some channels must be powered-up or powered-down dynamically when the other channel recording is on, then that use case is supported by setting the DYN_PUPD_CFG register.

The device supports an input signal bandwidth up to 100 kHz, which allows the high-frequency non-audio signal to be recorded by using a 216-kHz (or higher) sample rate. Wide bandwidth mode can be enabled or disabled by setting ADC_CHx_BW_MODE bit.

For sample rates of 48 kHz or lower, the device supports all features and various programmable processing blocks. However, for sample rates higher than 48 kHz, there are limitations in the number of simultaneous channel recording and playback supported and the number of biquad filters and such. See the *TAC5212 Sampling Rates and Programmable Processing Blocks Supported* application report for further details.

ADVANCE INFORMATION

8.3.7.1.1 Programmable Channel Gain and Digital Volume Control

The device has an independent programmable channel gain setting for each input channel that can be set to the appropriate value based on the maximum input signal expected in the system and the ADC VREF setting used (see the *セクション 8.3.5* section), which determines the ADC full-scale signal level.

The device has a programmable digital volume control with a range from –80 dB to 47 dB in steps of 0.5 dB with the option to mute the channel recording. The digital volume control value can be changed dynamically while the ADC channel is powered-up and recording. During volume control changes, the soft ramp-up or ramp-down volume feature is used internally to avoid any audible artifacts. Soft-stepping can be entirely disabled using the ADC_DSP_DISABLE_SOFT_STEP (P0_R114_D1) register bit.

The digital volume control setting is independently available for each output channel, including the digital microphone record channel. However, the device also supports an option to gang-up the volume control setting for all channels together using the channel 1 digital volume control setting, regardless if channel 1 is powered up or powered down. This gang-up can be enabled using the ADC_DSP_DVOL_GANG (P0_R114_D0) register bit.

表 8-12 shows the programmable options available for the digital volume control.

表 8-12. Digital Volume Control (DVC) Programmable Settings

P0_R82_D[7:0] : ADC_CH1_DVOL[7:0]	DVC SETTING FOR OUTPUT CHANNEL 1
0000 0000 = 0d	Output channel 1 DVC is set to mute
0000 0001 = 1d	Output channel 1 DVC is set to –80 dB
0000 0010 = 2d	Output channel 1 DVC is set to –79.5 dB
0000 0011 = 3d	Output channel 1 DVC is set to –79 dB

1010 0001 = 161d (default)	Output channel 1 DVC is set to 0 dB
1010 0010 = 162d	Output channel 1 DVC is set to 0.5 dB
…	…
1111 1101 = 253d	Output channel 1 DVC is set to 46 dB
1111 1110 = 254d	Output channel 1 DVC is set to 46.5 dB
1111 1111 = 255d	Output channel 1 DVC is set to 47 dB

Similarly, the digital volume control setting for output channel 2 to channel 4 can be configured using the CH2_DVOL (P0_R87) to CH4_DVOL (P0_R95) register bits, respectively.

The internal digital processing engine soft ramps up the volume from a muted level to the programmed volume level when the channel is powered up, and the internal digital processing engine soft ramps down the volume from a programmed volume to mute when the channel is powered down. This soft-stepping of volume is done to prevent abruptly powering up and powering down the record channel. This feature can also be entirely disabled using the ADC_DSP_DISABLE_SOFT_STEP (P0_R114_D1) register bit.

8.3.7.1.2 Programmable Channel Gain Calibration

Along with the digital volume control, this device also provides programmable channel gain calibration. The gain of each channel can be finely calibrated or adjusted in steps of 0.1 dB for a range of –0.8-dB to 0.7-dB gain error. This adjustment is useful when trying to match the gain across channels resulting from external components and microphone sensitivity. This feature, in combination with the regular digital volume control, allows the gains across all channels to be matched for a wide gain error range with a resolution of 0.1 dB. 表 8-13 shows the programmable options available for the channel gain calibration.

…	…
1110 = 14d	Input channel 1 gain calibration is set to 0.6 dB
1111 = 15d	Input channel 1 gain calibration is set to 0.7 dB

Similarly, the channel gain calibration setting for input channel 2 to channel 4 can be configured using the ADC_CH2_CFG3 (P0_R88) to ADC_CH4_CFG3 (P0_R96) register bits, respectively.

8.3.7.1.3 Programmable Channel Phase Calibration

In addition to the gain calibration, the phase delay in each channel can be finely calibrated or adjusted in steps of one modulator clock cycle for a cycle range of 0 to 255 for the phase error. The modulator clock, the same clock used for ADC_MOD_CLK, is 6.144 MHz (the output data sample rate is multiples or submultiples of 48 kHz) or 5.6448 MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) irrespective of the analog microphone or digital microphone use case. This feature is very useful for many applications that must match the phase with fine resolution between each channel, including any phase mismatch across channels resulting from external components or microphones. 表 8-14 shows the available programmable options for channel phase calibration.

表 8-14. Channel Phase Calibration Programmable Settings

P0_R64_D[7:0] : CH1_PCAL[7:0]	CHANNEL PHASE CALIBRATION SETTING FOR INPUT CHANNEL 1

…	…
1111 1110 = 254d	Input channel 1 phase calibration delay is set to 254 cycles of the modulator clock
1111 1111 = 255d	Input channel 1 phase calibration delay is set to 255 cycles of the modulator clock

Similarly, the channel phase calibration setting for input channel 2 to channel 8 can be configured using the CH2_PCAL (P0_R69) to CH8_PCAL (P0_R99) register bits, respectively.

The phase calibration feature must not be used when the analog input and PDM input are used together for simultaneous conversion.

8.3.7.1.4 Programmable Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a programmable high-pass filter (HPF). The HPF is not a channel-independent filter setting but is globally applicable for all ADC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter, and is efficient enough to filter out possible DC components of the signal. 表 8-15 shows the predefined –3-dB cutoff frequencies available that can be set by using the ADC_DSP_HPF_SEL[1:0] register bits of P0_R114. Additionally, to achieve a custom –3-dB cutoff frequency for a specific application, the device also allows the first-order IIR filter coefficients to be programmed when the HPF_SEL[1:0] register bits are set to 2'b00. 図 8-18 illustrates a frequency response plot for the HPF filter.

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{31} - D_1 z^{-1}} \quad (1)$$

The frequency response for this first-order programmable IIR filter with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the IIR coefficients in 表 8-16 to achieve the desired frequency response for high-pass filtering or any other desired filtering. If HPF_SEL[1:0] are set to 2'b00, the host device must write these coefficients values for the desired frequency response before powering-up any ADC channel for recording. 表 8-16 shows the filter coefficients for the first-order IIR filter.

8.3.7.1.5 Programmable Digital Biquad Filters

The device supports up to 12 programmable digital biquad filters available for ADC signal chain limited to 3/ channel. These highly efficient filters achieve the desired frequence response. The TAA5212 also supports on the fly programmable Biquad filters for two channel record use case. In digital signal processing, a digital biquad filter is a second-order, recursive linear filter with two poles and two zeros. 式 2 gives the transfer function of each biquad filter:

ADVANCE INFORMATION

$$H(z) = \frac{N_0 + 2N_1 z^{-1} + N_2 z^{-2}}{2^{31} - 2D_1 z^{-1} - D_2 z^{-2}} \quad (2)$$

The frequency response for the biquad filter section with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the biquad coefficients to achieve the desired frequency response for a low-pass, high-pass, or any other desired frequency shaping. The programmable coefficients for the mixer operation are located in the *Programmable Coefficient Registers: Page = 0x02* and *Programmable Coefficient Registers: Page = 0x03* sections. If biquad filtering is required, then the host device must write these coefficients values before powering up any ADC channels for recording. In two channel use case, the TAA5212 also supports on the fly programmable filters. In this case, Device uses two banks of filters for one channel with a switch bit to perform the switch from one filter bank to the other. As described in 表 8-17, these biquad filters can be allocated for each output channel based on the ADC_DSP_BQ_CFG[1:0] register setting of P0_R114. By setting BIQUAD_CFG[1:0] to 2'b00, the biquad filtering for all record channels is disabled and the host device can choose this setting if no additional filtering is required for the system application. See the *TAC5212 Programmable Biquad Filter Configuration and Applications* application report for further details.

8.3.7.1.6 Programmable Channel Summer and Digital Mixer

For applications that require an even higher SNR than that supported for each channel, the device digital summing mode can be used. In this mode, the digital record data are summed up across the channel with an equal weightage factor, which helps in reducing the effective record noise.

The device supports a fully programmable mixer feature that can mix the various input channels with their custom programmable scale factor to generate the final output channels. 図 8-19 shows a block diagram that describes the mixer 1 operation to generate output channel 1.

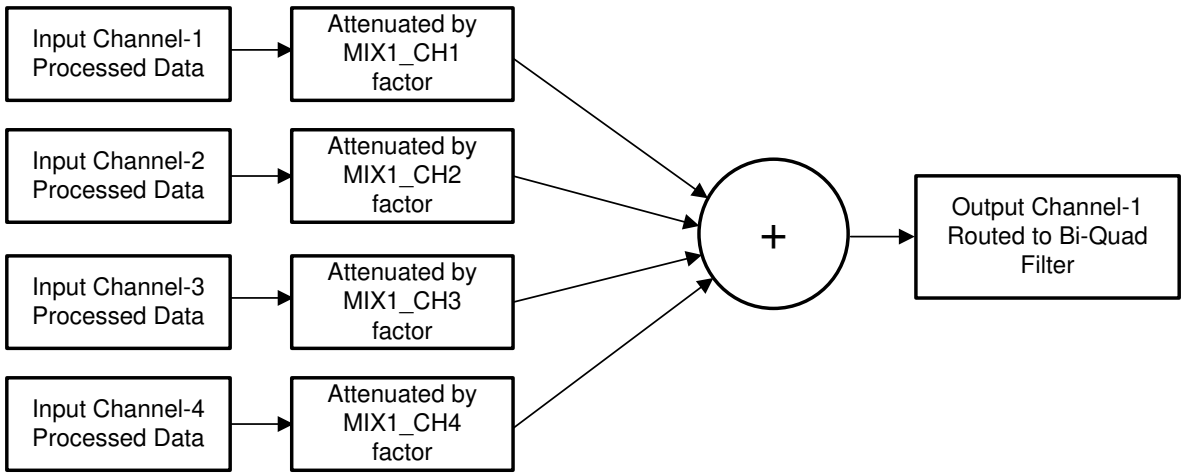

図 8-19. Programmable Digital Mixer Block Diagram

A similar mixer operation is performed by mixer 2, mixer 3, and mixer 4 to generate output channel 2, channel 3, and channel 4, respectively.

8.3.7.1.7 Configurable Digital Decimation Filters

The device record channel includes a high dynamic range, built-in digital decimation filter to process the oversampled data from the multibit delta-sigma (ΔΣ) modulator to generate digital data at the same Nyquist sampling rate as the FSYNC rate. The decimation filters in the device have Linear Phase response making them suitable for a wide variety of Audio applications.

8.3.7.1.7.1 Linear Phase Filters

The linear phase decimation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

8.3.7.1.7.1.1 Sampling Rate: 16 kHz or 14.7 kHz

図 8-20 and 図 8-21 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. 表 8-19 lists the specifications for a decimation filter with a 16-kHz or 14.7-kHz sampling rate.

8.3.8 Interrupts, Status, and Digital I/O Pin Multiplexing

Certain events in the device may require host processor intervention and can be used to trigger interrupts to the host processor. One such event is an audio serial interface (ASI) bus error. The device powers down the record channels if any faults are detected with the ASI bus error clocks, such as:

- Invalid FSYNC frequency
- Invalid SBCLK to FSYNC ratio
- Long pauses of the SBCLK or FSYNC clocks

When an ASI bus clock error is detected, the device shuts down all the record and playback channels as quickly as possible. After all ASI bus clock errors are resolved, the device volume ramps back to its previous state to recover the audio. During an ASI bus clock error, the internal interrupt request (IRQ) interrupt signal asserts low if the clock error interrupt mask register bit INT_MASK0[7] (P1_R47_D7) is set low. The clock fault is also available for readback in the latched fault status register bit INT_LTCH0 (P1_R52), which is a read-only register. Reading the latched fault status register, INT_LTCH0, clears all latched fault status. The device can be additionally configured to route the internal IRQ interrupt signal on the GPIOx or GPO1 pins and also can be configured as open-drain outputs so that these pins can be wire-ANDed to the open-drain interrupt outputs of other devices.

The IRQ interrupt signal can either be configured as active low or active high polarity by setting the INT_POL (P0_R66_D7) register bit. This signal can also be configured as a single pulse or a series of pulses by programming the INT_EVENT[1:0] (P0_R66_D[6:5]) register bits. If the interrupts are configured as a series of pulses, the events trigger the start of pulses that stop when the latched fault status register is read to determine the cause of the interrupt.

The device also supports read-only live-status registers to determine if the channels are powered up or down and if the device is in sleep mode or not. These status registers are located in the DEV_STS0 (P0_R121) and DEV_STS1 (P0_R122) register bits.

The device has a multifunctional GPIO1 pin that can be configured for a desired specific function. 表 8-24 lists all possible allocations of these multifunctional pins for the various features.

(1) S means the feature mentioned in this row is *supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.

Each GPOx or GPIOx pin can be independently set for the desired drive configurations setting using the GPIOx_DRV[2:0] or GPO1_DRV[2:0] register bits. 表 8-25 lists the drive configuration settings.

表 8-25. GPIO or GPOx Pins Drive Configuration Settings

P0_R10_D[2:0] : GPIO1_DRV[2:0]	GPIO OUTPUT DRIVE CONFIGURATION SETTINGS FOR GPIO1
000	The GPIO1 pin is set to high impedance (floated)
001	The GPIO1 pin is set to be driven active low or active high
010 (default)	The GPIO1 pin is set to be driven active low or weak high (on-chip pullup)
011	The GPIO1 pin is set to be driven active low or Hi-Z (floated)
100	The GPIO1 pin is set to be driven weak low (on-chip pulldown) or active high
101	The GPIO1 pin is set to be driven Hi-Z (floated) or active high
110 and 111	Reserved (do not use these settings)

Similarly, the GPO1 pin can be configured using the GPO1_DRV(P0_R12) register bits.

When configured as a general-purpose output (GPO), the GPIOx or GPO1 pin values can be driven by writing the GPO_GPI_VAL (P0_R14) registers. The GPIO_MON bits (P0_R14_D[3:1]) can be used to readback the status of the GPIOx or GPI1 pin when configured as a general-purpose input (GPI).

8.3.9 Programmable Channel Phase Calibration

In addition to the gain calibration, the phase delay in each channel can be finely calibrated or adjusted in steps of one modulator clock cycle for a cycle range of 0 to 255 for the phase error. The modulator clock, the same clock used for ADC_MOD_CLK, is 6.144 MHz (the output data sample rate is multiples or submultiples of 48 kHz) or 5.6448 MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) irrespective of the analog microphone or digital microphone use case. This feature is very useful for many applications that must match the phase with fine resolution between each channel, including any phase mismatch across channels resulting from external components or microphones. 表 8-26 shows the available programmable options for channel phase calibration.

1111 1111 = 255d	Input channel 1 phase calibration delay is set to 255 cycles of the modulator clock

Similarly, the channel phase calibration setting for input channel 2 to channel 8 can be configured using the CH2_PCAL (P0_R69) to CH8_PCAL (P0_R99) register bits, respectively.

The phase calibration feature must not be used when the analog input and PDM input are used together for simultaneous conversion.

8.4 Device Functional Modes

8.5 Register Maps

This section describes the control registers for the device in detail. All these registers are eight bits in width and allocated to device configuration and programmable coefficients settings. These registers are mapped internally using a page scheme that can be controlled using either I^2C or SPI communication to the device. Each page contains 128 bytes of registers. All device configuration registers are stored in page 0, page 1 and page 3. Page 0 is the default page setting at power up (and after a software reset). The device current page can be switch to a new desired page by using the PAGE[7:0] bits located in register 0 of every page.

Do not read from or write to reserved pages or reserved registers. Write only default values for the reserved bits in the valid registers.

The procedure for register access across pages is:

- Select page N (write data *N* to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page N
- Select the new page M (write data *M* to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page M
- Repeat as needed

8.5.1.78 I2C_CKSUM Register (Address = 0x7E) [Reset = 0x00]

I2C_CKSUM is shown in 表 8-105.

Return to the Summary Table.

This register returns the I^2C transactions checksum value.

表 8-105. I2C_CKSUM Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	I2C_CKSUM[7:0]	R/W	00000000b	These bits return the I^2C transactions checksum value. Writing to this register resets the checksum to the written value. This register is updated on writes to other registers on all pages.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The TAA5212 is a stereo, high-performance audio ADC that supports sample rates of up to 768 kHz. The device supports up to a total of 4 microphones for simultaneous recording which can be selected from up to 2 analog microphones or 4 digital pulse density modulation (PDM) microphones.

Communication to the TAA5212 for configuration of the control registers is supported using an I^2C or SPI interface. The device supports a highly flexible, audio serial interface (TDM, I^2S, and LJ) to transmit audio data seamlessly in the system across devices.

9.2 Typical Application

9.2.1 Application

図 9-1 shows a typical configuration of the TAA5212 for an application using two analog ECM microphones for simultaneous recording with an I^2C control interface and a time-division multiplexing (TDM) audio data target interface. For best distortion performance, use input AC-coupling capacitors with a low-voltage coefficient.

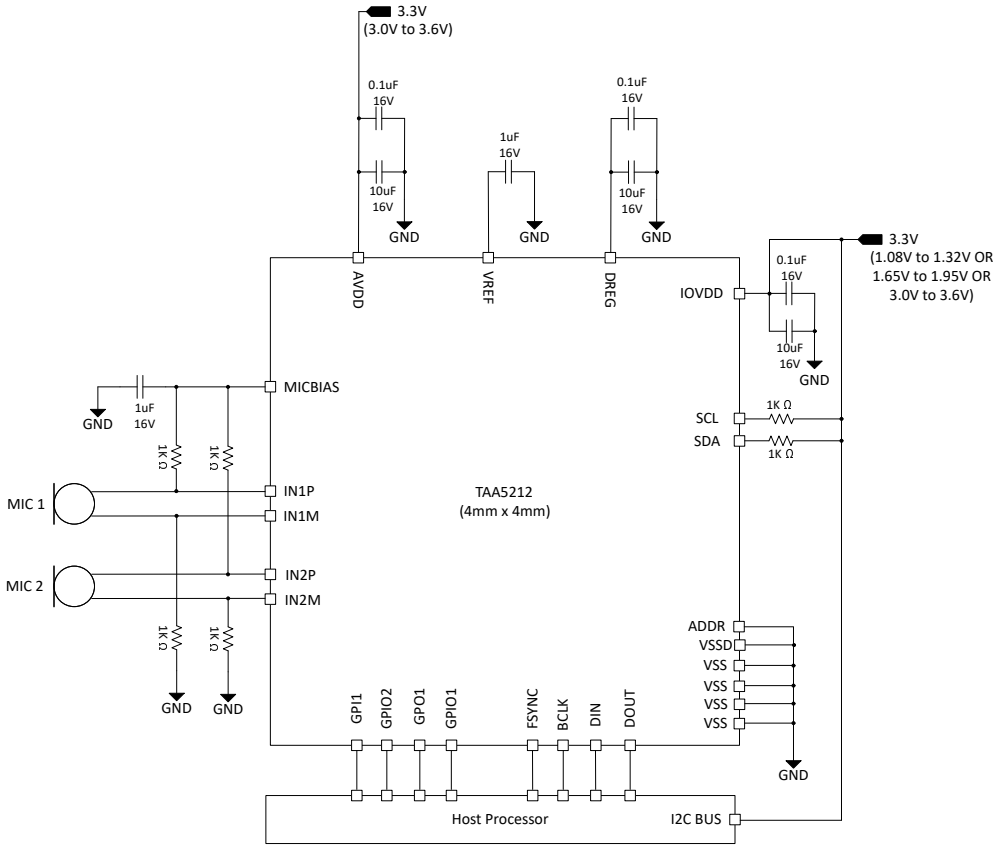

図 9-1. Stereo Microphone Block Diagram

9.2.2 Design Requirements

表 9-1 lists the design parameters for this application.

表 9-1. Design Parameters

PARAMETER	VALUE
AVDD	3.3 V
IOVDD	1.2 V or 1.8 V or 3.3 V
AVDD supply current consumption	TBD
IOVDD supply current consumption	TBD
Maximum MICBIAS current	5 mA

9.2.3 Detailed Design Procedure

This section describes the necessary steps to configure the TAA5212 for this specific application. The following steps provide a sequence of items that must be executed in the time between powering the device up and reading data from the device or transitioning from one mode to another mode of operation.

1. Apply power to the device:
   a. Power up the IOVDD and AVDD power supplies
   b. Wait for at least 1ms to allow the device to initialize the internal registers.
   c. The device now goes into sleep mode (low-power mode < 10 µA)
2. Transition from sleep mode to active mode whenever required for the operation:
   a. Wake up the device by writing to P0_R2 to disable sleep mode
   b. Wait for at least 1 ms to allow the device to complete the internal wake-up sequence
   c. Override the default configuration registers or programmable coefficients value as required (this step is optional)
   d. Enable all desired input channels by writing to P0_R118
   e. Enable all desired audio serial interface input/output channels by writing to P0_R30 to P0_R37 for ADC
   f. Power-up the ADC and MICBIAS by writing to P0_R120
   g. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio

      This specific step can be done at any point in the sequence after step a.

      See the *セクション 8.3.3* section for supported sample rates and the BCLK to FSYNC ratio.
   h. The device recording data is now sent to the host processor using the TDM audio serial data bus and playback data from TDM is now played on the lineout
3. Transition from active mode to sleep mode (again) as required in the system for low-power operation:
   a. Enter sleep mode by writing to P0_R2 to enable sleep mode
   b. Wait at least 6 ms (when FSYNC = 48 kHz) for the volume to ramp down and for all blocks to power down
   c. Read P0_R122 to check the device shutdown and sleep mode status
   d. If the device P0_R122_D[7:5] status bit is 3'b100 then stop FSYNC and BCLK in the system
   e. The device now goes into sleep mode (low-power mode < 10 µA) and retains all register values
4. Transition from sleep mode to active mode (again) as required for the recording operation:
   a. Wake up the device by writing to P0_R2 to disable sleep mode
   b. Wait at least 1 ms to allow the device to complete the internal wake-up sequence
   c. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio
   d. The device recording data is now sent to the host processor using the TDM audio serial data bus and playback data from TDM is now played on the lineout
5. Repeat step 4 and step 5 as required for mode transitions

10 Power Supply Recommendations

The power-supply sequence between the IOVDD and AVDD rails can be applied in any order. However, after all supplies are stable, then only initiate the I^2C or SPI transactions to initialize the device.

For the supply power-up requirement, t_1, t_2 must be at least 2 ms to allow the device to initialize the internal registers. See the *セクション 8.4* section for details on how the device operates in various modes after the device power supplies are settled to the recommended operating voltage levels. For the supply power-down requirement, t_4, t_5 and t_6 must be at least 10 ms. This timing (as shown in 図 10-1) allows the device to ramp down the volume on the record data, power down the analog and digital blocks, and put the device into shutdown mode. The device can also be immediately put into shutdown mode by ramping down power supplies, but doing so causes an abrupt shutdown.

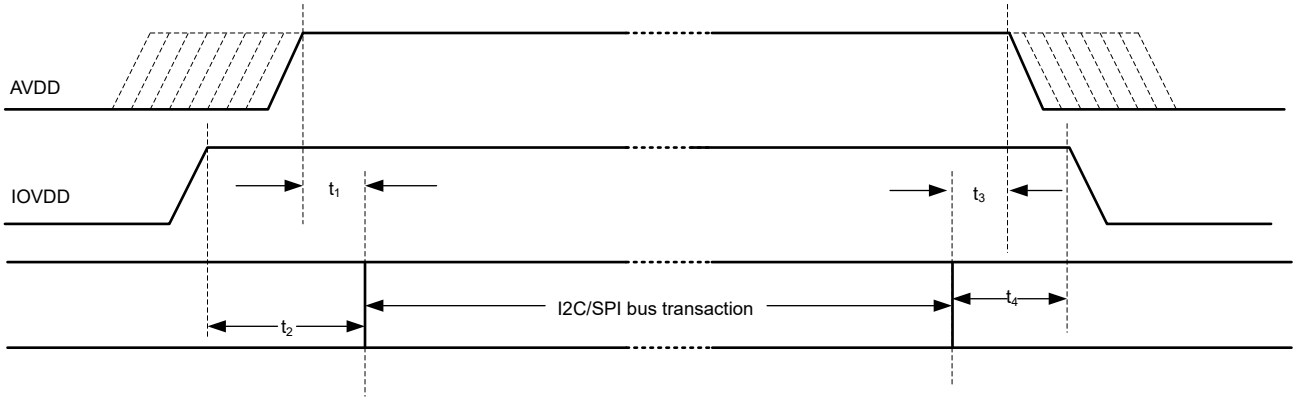

図 10-1. Power-Supply Sequencing Requirement Timing Diagram

Make sure that the supply ramp rate is slower than 0.1V/µs and that the wait time between a power-down and a power-up event is at least 100 ms. For supply ramp rate slower than 0.1 V/ms, host device must apply a software reset as first transaction before doing any device configuration. Make sure all digital input pins are at valid input levels and not toggling during supply sequencing.

The TAA5212 supports a single AVDD supply operation by integrating an on-chip digital regulator, DREG, and an analog regulator, AREG.

12.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
