

TAS6424-Q1 75W、2MHzデジタル入力、4チャンネル車載用Class-Dオーディオ・アンプ、負荷ダンパ保護およびI²C診断機能搭載

1 特長

- 高度な負荷診断
 - 入力クロックなしで動作
 - AC診断による、インピーダンスおよびフェーズ応答を含むツイータ検出
- CISPR25-L5 EMC仕様へ簡単に適合
- 車載アプリケーションに認定済み
- オーディオ入力
 - 4チャンネルのI²Sまたは4/8チャンネルのTDM入力
 - 入力サンプル・レート: 44.1kHz、48kHz、96kHz
 - 入力フォーマット: 16ビットから32ビットのI²SおよびTDM
- オーディオ出力
 - 4チャンネルのBTL (Bridge-Tied Load)、並列BTL (PBTL)のオプションあり
 - 最大2.1MHzの出力スイッチング周波数
 - 75W、10% THD (4Ω、25V)
 - 45W、10% THD (2Ω、14.4V)
 - 150W、10% THD (2Ω、25V PBTL)
- 14.4V、4Ω負荷でのオーディオ性能
 - 1WでTHD+N < 0.03%
 - 出力ノイズ: 42μV_{RMS}
 - クロストーク: –90dB
- 負荷診断
 - 出力開路および負荷短絡
 - 出力からバッテリーまたはグラウンドへの短絡
 - 最大6kΩのライン出力検出
 - ホストと独立の動作
 - プログラム可能なため柔軟な生産ラインのテストが可能
- 保護
 - 出力電流制限
 - 出力短絡保護
 - 40Vの負荷ダンパ
 - グラウンド開路と電力許容
 - DCオフセット
 - 過熱
 - 低電圧および過電圧
- 一般的な動作
 - 4.5V～26.4Vの電源電圧
 - 4つのアドレス・オプションを持つI²C制御
 - クリップ検出およびサーマル警告

2 アプリケーション

- 車載用ヘッド・ユニット
- 車載用外部アンプ・モジュール

3 概要

TAS6424-Q1 デバイスは、4チャンネルのデジタル入力、Class-Dオーディオ・アンプで、2.1MHzのPWMスイッチング周波数を実装されているため、非常に小さなサイズのPCBでコスト最適化されたソリューションを実現可能です。開始/停止イベントについて最低4.5Vで完全な動作を行い、最高40kHzのオーディオ帯域幅で非常に優れた音質を提供します。

TAS6424-Q1 Class-Dオーディオ・アンプは、車載用ヘッドユニット、および外部アンプ・モジュールで使用するよう設計されています。このデバイスには4つのチャンネルがあり、14.4V電源から4Ω負荷へ10% THD+Nで27Wを、2Ω負荷へ10% THD+Nで45Wを、25V電源から4Ω負荷へ10% THD+Nで75Wを供給できます。Class-Dトポロジにより、従来のリニア・アンプ・ソリューションと比較して劇的に効率が向上しています。出力スイッチング周波数をAMバンドよりも高く設定すると、AMバンドの干渉を排除し、出力フィルタのサイズとコストを削減できます。また、AMバンドよりも低く設定すれば、効率を最適化できます。

製品情報⁽¹⁾

	18		
	28		
	33		
	36		
	39		
	46		
	49		
52			
GVDD	9	PWR	Gate drive voltage regulator for channel 3 and 4, derived from VBAT input pin.
	10		Gate drive voltage regulator for channel 1 and 2, derived from VBAT input pin.
I2C_ADDR0	22	DI	I ² C address pins
I2C_ADDR1	23		
MCLK	12	DI	Audio master clock input
$\overline{\text{MUTE}}$	25	DI	Mutes the device outputs (active low), 100-k Ω internal pulldown resistor
OUT_1M	32	NO	Negative output for the channel
OUT_1P	34	PO	Positive output for the channel
OUT_2M	38	NO	Negative output for the channel
OUT_2P	40	PO	Positive output for the channel
OUT_3M	45	NO	Negative output for the channel
OUT_3P	47	PO	Positive output for the channel
OUT_4M	51	NO	Negative output for the channel
OUT_4P	53	PO	Positive output for the channel
PVDD	2	PWR	PVDD voltage input (can be connected to battery)
	29		
	30		
	42		
	43		
	55		
	56		

(1) GND = ground, PWR = power, PO = positive output, NO = negative output, DI = digital input, DO = digital output, DI/O = digital input and output, NC = no connection

Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
SCL	20	DI	I ² C clock input
SCLK	13	DI	Audio bit and serial clock input
SDA	21	DI/O	I ² C data input and output
SDIN1	15	DI	TDM data input and audio I ² S data input for channels 1 and 2
SDIN2	16	DI	Audio I ² S data input for channels 3 and 4
$\overline{\text{STANDBY}}$	24	DI	Enables low power standby state (active Low), 100-k Ω internal pulldown resistor
VBAT	3	PWR	Battery voltage input
VCOM	6	PWR	Bias voltage
VDD	19	PWR	3.3-V external supply voltage
VREG	5	PWR	Voltage regulator bypass
$\overline{\text{WARN}}$	27	DO	Clip and overtemperature warning (active low, open drain), 100-k Ω internal pullup resistor
Thermal Pad	—	GND	Provides both electrical and thermal connection for the device. Heatsink must be connected to GND.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
PVDD, VBAT	DC supply voltage relative to GND	-0.3	30	V
V _{MAX}	Transient supply voltage: PVDD, VBAT	-1	40	V
V _{RAMP}	Supply-voltage ramp rate: PVDD, VBAT		75	V/ms
VDD	DC supply voltage relative to GND	-0.3	3.5	V
I _{MAX}	Maximum current per pin (PVDD, VBAT, OUT_xP, OUT_xM, GND)		8	A
I _{MAX_PULSED}	Pulsed supply current per PVDD pin (one shot)		12	A
V _{LOGIC}	Input voltage for logic pins (SCL, SDA, SDIN1, SDIN2, MCLK, BCLK, LRCLK, MUTE, $\overline{\text{STANDBY}}$, I2C_ADDRx)	-0.3	VDD + 0.5	V
V _{GND}	Maximum voltage between GND pins	-0.3	0.3	V
T _J	Maximum operating junction temperature	-55	150	°C
T _{stg}	Storage temperature	-55	150	°C

8.2 ESD Ratings

		VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±3000	
		Charged-device model (CDM), per AEC Q100-011	All pins	±500
			Corner pins (1, 28, 29 and 56)	±1000

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

8.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
PVDD	Output FET supply voltage	Relative to GND	4.5		26.4	V
VBAT	Battery supply voltage input	Relative to GND	4.5	14.4	18	V
VDD	DC logic supply	Relative to GND	3.0	3.3	3.5	V
T _A	Ambient temperature		-40		125	°C
T _J	Junction temperature	An adequate thermal design is required	-40		150	°C
R _L	Nominal speaker load impedance	BTL Mode	2	4		Ω
		PBTL Mode	1	2		
R _{PU_I2C}	I ² C pullup resistance on SDA and SCL pins		1	4.7	10	kΩ
C _{Bypass}	External capacitance on bypass pins	Pin 2, 3, 5, 6, 8, 9, 10, 19		1		μF
C _{OUT}	External capacitance to GND on OUT pins	Limit set by DC-diagnostic timing		1	3.3	μF
L _O	Output filter inductance	Minimum inductance at I _{SD} current levels	1			μH

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TAS6424-Q1 ⁽²⁾	TAS6424-Q1 ⁽³⁾	UNIT
		DKQ (HSSOP)	DKQ (HSSOP)	
		56 PINS	56 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	—	—	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	0.7	1.1	°C/W
R _{θJB}	Junction-to-board thermal resistance	—	—	°C/W
ψ _{JT}	Junction-to-top characterization parameter	—	—	°C/W
ψ _{JB}	Junction-to-board characterization parameter	10	10	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	—	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report (SPRA953).
 (2) JEDEC Standard 4 Layer PCB.
 (3) Measured using the TAS6424-Q1 EVM layout and heat sink. The device is not intended to be used without a heat sink.

8.5 Electrical Characteristics

Test conditions (unless otherwise noted): T_C = 25°C, PVDD = VBAT = 14.4 V, VDD = 3.3 V, R_L = 4 Ω, P_{out} = 1 W/ch, f = 1 kHz, f_{SW} = 2.11 MHz, AES17 Filter, default I²C settings, see [79](#) and [82](#)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OPERATING CURRENT						
I _{PVDD_IDLE}	PVDD idle current	All channels playing, no audio input		75	90	mA
I _{VBAT_IDLE}	VBAT idle current	All channels playing, no audio input		90	100	mA
I _{PVDD_STBY}	PVDD standby current	STANDBYActive, VDD = 0 V		1	10	μA
I _{VBAT_STBY}	VBAT standby current	STANDBYActive, VDD = 0 V		4	10	μA
I _{VDD}	VDD supply current	All channels playing, -60-dB signal		15	18	mA
OUTPUT POWER						
P _{O_BTL}	Output power per channel, BTL	4 Ω, PVDD = 14.4 V, THD+N = 1%, T _C = 75°C	20	22		W
		4 Ω, PVDD = 14.4 V, THD+N = 10%, T _C = 75°C	25	27		
		2 Ω, PVDD = 14.4 V, THD+N = 1%, T _C = 75°C	38	40		
		2 Ω, PVDD = 14.4 V, THD+N = 10%, T _C = 75°C	42	45		
		4 Ω, PVDD = 25 V, THD+N = 1%, T _C = 75°C	50	55		
		4 Ω, PVDD = 25 V, THD+N = 10%, T _C = 75°C	70	75		
P _{O_PBTL}	Output power per channel in parallel mode, PBTL	2 Ω, PVDD = 14.4 V, THD+N = 1%, T _C = 75°C	35	40		W
		2 Ω, PVDD = 14.4 V, THD+N = 10%, T _C = 75°C	45	50		
		1 Ω, PVDD = 14.4 V, THD+N = 1%, T _C = 75°C	72	80		
		1 Ω, PVDD = 14.4 V, THD+N = 10%, T _C = 75°C	80	90		
		2 Ω, PVDD = 25 V, THD+N = 1%, T _C = 75°C	98	120		
		2 Ω, PVDD = 25 V, THD+N = 10%, T _C = 75°C	138	150		

Electrical Characteristics (continued)

Test conditions (unless otherwise noted): $T_C = 25^\circ\text{C}$, $PVDD = VBAT = 14.4\text{ V}$, $VDD = 3.3\text{ V}$, $R_L = 4\ \Omega$, $P_{out} = 1\text{ W/ch}$, $f = 1\text{ kHz}$, $f_{SW} = 2.11\text{ MHz}$, AES17 Filter, default I²C settings, see [79](#) and [82](#)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
EFF _P	Power efficiency	4 channels operating, 25-W output power/ch 4-Ω load, PVDD = 14.4 V, T _C = 25°C, including inductor losses(1)		86%		
AUDIO PERFORMANCE						
V _n	Output noise voltage	Zero input, A-weighting, gain level 1, PVDD = 14.4 V		42		μV
		Zero input, A-weighting, gain level 2, PVDD = 14.4 V		55		
		Zero input, A-weighting, gain level 3, PVDD = 18 V		67		
		Zero input, A-weighting, gain level 4, PVDD = 25 V		85		
GAIN	Peak output voltage/dBFS	Gain level 1, Register 0x01, bit 1-0 = 00		7.5		V/FS
		Gain level 2, Register 0x01, bit 1-0 = 01		15		
		Gain level 3, Register 0x01, bit 1-0 = 10		21		
		Gain level 4, Register 0x01, bit 1-0 = 11		29		
Crosstalk	Channel crosstalk	PVDD = 14.4 Vdc + 1 V _{RMS} , f = 1 kHz		-90	-75	dB
PSRR	Power-supply rejection ratio	PVDD = 14.4 Vdc + 1 V _{RMS} , f = 1 kHz		75		dB
THD+N	Total harmonic distortion + noise			0.02%	0.05%	
G _{CH}	Channel-to-channel gain variation		-0.5	0	0.5	dB
LINE OUTPUT PERFORMANCE						
V _{n,LINEOUT}	LINE output noise voltage	Zero input, A-weighting, channel set to LINE MODE		42		μV
V _{O,LINEOUT}	LINE output voltage	0-dB input, channel set to LINE MODE		5.5		V _{RMS}
THD+N	Line output total harmonic distortion + noise	V _O = 2 V _{RMS} , channel set to LINE MODE		0.01%	0.03%	
DIGITAL INPUT PINS						
V _{IH}	Input logic level high		70			%VDD
V _{IL}	Input logic level low				30	%VDD
I _{IH}	Input logic current, high	V _I = VDD			15	μA
I _{IL}	Input logic current, low	V _I = 0			-15	μA
PWM OUTPUT STAGE						
R _{DS(on)}	FET drain-to-source resistance	Not including bond wire and package resistance		90		mΩ
OVERVOLTAGE (OV) PROTECTION						
V _{PVDD_OV}	PVDD overvoltage shutdown		27.0	27.8	28.8	V
V _{PVDD_OV_HYS}	PVDD overvoltage shutdown hysteresis			0.8		V
V _{VBAT_OV}	VBAT overvoltage shutdown		19.3	20	22	V
V _{VBAT_OV_HYS}	VBAT overvoltage shutdown hysteresis			0.6		V
UNDERVOLTAGE (UV) PROTECTION						
VBAT _{UV}	VBAT undervoltage shutdown			4	4.5	V
VBAT _{UV_HYS}	VBAT undervoltage shutdown hysteresis			0.2		V
PVDD _{UV}	PVDD undervoltage shutdown			4	4.5	V
PVDD _{UV_HYS}	PVDD undervoltage shutdown hysteresis			0.2		V
BYPASS VOLTAGES						
V _{GVDD}	Gate drive bypass pin voltage			7		V
V _{AVDD}	Analog bypass pin voltage			6		V
V _{VCOM}	Common bypass pin voltage			2.5		V
V _{VREG}	Regulator bypass pin voltage			5.5		V
POWER-ON RESET (POR)						
V _{POR}	VDD voltage for POR			2.1	2.7	V
V _{POR_HYS}	VDD POR recovery hysteresis voltage			0.5		V
OVERTEMPERATURE (OT) PROTECTION						
OTW(i)	Channel overtemperature warning			150		°C

Electrical Characteristics (continued)

Test conditions (unless otherwise noted): $T_C = 25^\circ\text{C}$, $PVDD = VBAT = 14.4\text{ V}$, $VDD = 3.3\text{ V}$, $R_L = 4\ \Omega$, $P_{out} = 1\text{ W/ch}$, $f = 1\text{ kHz}$, $f_{SW} = 2.11\text{ MHz}$, AES17 Filter, default I²C settings, see [79](#) and [82](#)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OTSD(i)	Channel overtemperature shutdown			175		°C
OTW	Global junction overtemperature warning	Set by register 0x01 bit 5-6, default value		130		°C
OTSD	Global junction overtemperature shutdown			160		°C
OT _{HYS}	Overtemperature hysteresis			15		°C
LOAD OVER CURRENT PROTECTION						
I _{LIM}	Overcurrent cycle-by-cycle limit	OC Level 1	4	4.8		A
		OC Level 2	6	6.5		A
I _{SD}	Overcurrent shutdown	OC Level 1, Any short to supply, ground, or other channels		7		A
		OC Level 2, Any short to supply, ground, or other channels		9		A
MUTE MODE						
G _{MUTE}	Output attenuation			100		dB
CLICK AND POP						
V _{CP}	Output click and pop voltage	ITU-R 2k filter, High-Z/MUTE to Play, Play to Mute/High-Z		7		mV
DC OFFSET						
V _{OFFSET}	Output offset voltage			2	5	mV
DC DETECT						
DC _{FAULT}	Output DC fault protection			2	2.5	V
DIGITAL OUTPUT PINS						
V _{OH}	Output voltage for logic level high	I = ±2 mA	90			%VDD
V _{OL}	Output voltage for logic level low	I = ±2 mA			10	%VDD
t _{DELAY_CLIPDET}	Signal delay when output clipping detected				20	μs
LOAD DIAGNOSTICS						
S2P	Maximum resistance to detect a short from OUT pins to PVDD				500	Ω
S2G	Maximum resistance to detect a short from OUT pins to ground				200	Ω
SL	Shorted load detection tolerance	Other channels in Hi-Z			±0.5	Ω
OL	Open load	Other channels in Hi-Z	40	70		Ω
T _{DC_DIAG}	DC diagnostic time	All 4 Channels		230		ms
LO	Line output				6	kΩ
T _{LINE_DIAG}	Line output diagnostic time			40		ms
AC _{IMP}	AC impedance accuracy	Gain linearity, f = 19 kHz, R _L = 2 Ω to 16 Ω,			25%	
		Offset			±0.5	Ω
T _{AC_DIAG}	AC diagnostic time	All 4 Channels		520		ms
I²C_ADDR PINS						
t _{I2C_ADDR}	Time delay needed for I ² C address set-up			300		μs

(1) Tested with Output Inductor DFEG7030D-3R3M.

8.6 Timing Requirements

Test conditions (unless otherwise noted): $T_C = 25\text{ }^\circ\text{C}$, $PVDD = VBAT = 14.4\text{ V}$, $VDD = 3.3\text{ V}$, $R_L = 4\text{ }\Omega$, $P_O = 1\text{ W/ch}$, $f = 1\text{ kHz}$, $f_{SW} = 2.11\text{ MHz}$, AES17 Filter, default I²C settings, see [Figure 79](#) and [Figure 82](#)

		MIN	TYP	MAX	UNIT
I²C CONTROL PORT (See Figure 42)					
t_{BUS}	Bus free time between start and stop conditions	1.3			μs
t_{HOLD1}	Hold time, SCL to SDA	0			ns
t_{HOLD2}	Hold time, start condition to SCL	0.6			μs
t_{START}	I ² C startup time after VDD power on reset			12	ms
t_{RISE}	Rise time, SCL and SDA			300	ns
t_{FALL}	Fall time, SCL and SDA			300	ns
t_{SU1}	Setup, SDA to SCL	100			ns
t_{SU2}	Setup, SCL to start condition	0.6			μs
t_{SU3}	Setup, SCL to stop condition	0.6			μs
$t_{W(H)}$	Required pulse duration SCL <i>High</i>	0.6			μs
$t_{W(L)}$	Required pulse duration SCL <i>Low</i>	1.3			μs
SERIAL AUDIO PORT (See Figure 36)					
D_{MCLK} , D_{SCLK}	Allowable input clock duty cycle	45%	50%	55%	
f_{MCLK}	Supported MCLK frequencies: 128, 256, or 512	128		512	xFS
f_{MCLK_Max}	Maximum frequency			25	MHz
t_{SCY}	SCLK pulse cycle time	40			ns
t_{SCL}	SCLK pulse-with LOW	16			ns
t_{SCH}	SCLK pulse-with HIGH	16			ns
$t_{rise/fall}$	Rise and fall time	4			ns
t_{SF}	SCLK rising edge to FSYNC edge	8			ns
t_{FS}	FSYNC rising edge to SCLK edge	8			ns
t_{DS}	DATA set-up time	8			ns
t_{DH}	DATA hold time	8			ns
C_i	Input capacitance, pins MCLK, SCLK, FSYNC, SDIN1, SDIN2			10	pF
T_{LA}	Latency from input to output measured in FSYNC sample count	FSYNC = 44.1 kHz or 48 kHz			30
		FSYNC = 96 kHz			12

8.7 Typical Characteristics

$T_A = 25\text{ }^\circ\text{C}$, $V_{VDD} = 3.3\text{ V}$, $V_{BAT} = PVDD = 14.4\text{ V}$, $R_L = 4\text{ }\Omega$, $f_{IN} = 1\text{ kHz}$, $f_s = 48\text{ kHz}$, $f_{SW} = 2.11\text{ MHz}$, AES17 filter, default I²C settings, see [79](#) and [82](#) (unless otherwise noted)

9 Parameter measurement Information

The parameters for the TAS6424-Q1 device were measured using the circuit in [79](#).

10 Detailed description

10.1 Overview

The TAS6424-Q1 device is a four-channel digital-input Class-D audio amplifier for use in the automotive environment. The device is designed for vehicle battery operation or boosted voltage systems. The design uses ultra-efficient class-D technology developed by Texas Instruments specifically tailored for the automotive industry. This technology allows for reduced power consumption, reduced PCB area, reduced heat, and reduced peak currents in the electrical system. The device realizes an audio sound-system design with smaller size and lower weight than traditional class-AB solutions.

The core design blocks are as follows:

- Serial audio port
- Clock management
- High-pass filter and volume control
- Pulse width modulator (PWM) with output stage feedback
- Gate drive
- Power FETs
- Diagnostics
- Protection
- Power supply
- I²C serial communication bus

10.3 Feature Description

10.3.1 Serial Audio Port

The serial audio port (SAP) receives audio in either I²S, left justified, right justified, or TDM formats.

Settings for the serial audio port are programmed in the SAP control register (address 0x03), see the [SAP Control \(Serial Audio-Port Control\) Register \(address = 0x03\) \[default = 0x04\]](#) section.

Figure 35 shows the digital audio data connections for I²S and TDM8 mode for an eight channel system.

Figure 35. Digital-Audio Data Connection

10.3.1.1 I²S Mode

I²S timing uses the FSYNC pin to define when the data being transmitted is for the left channel and when it is for the right channel. The FSYNC pin is low for the left channel and high for the right channel. The bit clock, SCLK, runs at 32 or $64 \times f_s$ and is used to clock in the data. A delay of one bit clock occurs from the time the FSYNC signal changes state to the first bit of data on the data lines. The data is presented in 2s-complement form (MSB-first). The data is valid on the rising edge of the bit clock and is used to clock in the data.

10.3.1.2 Left-Justified Timing

Left-justified (LJ) timing also uses the FSYNC pin to define when the data being transmitted is for the left channel and when it is for the right channel. The FSYNC pin is high for the left channel and low for the right channel. A bit clock running at 32 or $64 \times f_s$ is used to clock in the data. The first bit of data appears on the data lines at the same time FSYNC toggles. The data is written MSB-first and is valid on the rising edge of the bit clock. Digital words can be 16-bits or 24-bits wide and pad any unused trailing data-bit positions in the left-right (L/R) frame with zeros.

10.3.1.3 Right-Justified Timing

Right-justified (RJ) timing also uses the FSYNC pin to define when the data being transmitted is for the left channel and when it is for the right channel. The FSYNC pin is high for the left channel and low for the right channel. A bit clock running at 32 or $64 \times f_s$ is used to clock in the data. The first bit of data appears on the data 8-bit clock periods (for 24-bit data) after the FSYNC pin toggles. In RJ mode the LSB of data is always clocked by the last bit clock before the FSYNC pin transitions. The data is written MSB-first and is valid on the rising edge of bit clock. The device pads the unused leading data-bit positions in the L/R frame with zeros.

Feature Description (continued)

10.3.1.4 TDM Mode

TDM mode supports 4 or 8 channels of audio data. The device can be configured through I²C to use different stereo pairs in the TDM data stream. The TDM mode supports 16-bit, 24-bit, and 32-bit input data lengths.

In TDM mode, the SCLK pin must be 128 or 256, depending on the TDM slot size. In TDM mode SCLK and MCLK can be connected together

In TDM mode, the SDIN1 pin (pin 15) is used for digital audio data. TI recommends to connect the unused SDIN2 pin (pin 16) to ground. [表 1](#) lists register settings for the TDM channel selection.

表 1. TDM Channel Selection

REGISTER SETTING		TDM8 CHANNEL SLOT							
0x03 BIT 5	0x03 BIT 3	1	2	3	4	5	6	7	8
0	0	CH1	CH2	CH3	CH4	—	—	—	—
1	0	—	—	—	—	CH1	CH2	CH3	CH4
0	1	CH3	CH4	CH1	CH2	—	—	—	—
1	1	—	—	—	—	CH3	CH4	CH1	CH2

If PBTL mode is programmed for channel 1/2 or channel 3/4 the datasource can be set according to [表 2](#).

表 2. TDM Channel Selection in PBTL Mode

REGISTER SETTING			TDM8 CHANNEL SLOT							
0x03 BIT 5	0x03 BIT 3	0x21 BIT 6	1	2	3	4	5	6	7	8
0	0	0	PBTL CH1/2	—	PBTL CH3/4	—	—	—	—	—
1	0	0	—	—	—	—	PBTL CH1/2	—	PBTL CH3/4	—
0	0	1	—	PBTL CH1/2	—	PBTL CH3/4	—	—	—	—
1	0	1	—	—	—	—	—	PBTL CH1/2	—	PBTL CH3/4
0	1	0	PBTL CH3/4	—	PBTL CH1/2	—	—	—	—	—
1	1	0	—	—	—	—	PBTL CH3/4	—	PBTL CH1/2	—
0	1	1	—	PBTL CH3/4	—	PBTL CH1/2	—	—	—	—
1	1	1	—	—	—	—	—	PBTL CH3/4	—	PBTL CH1/2

10.3.1.5 Supported Clock Rates

The device supports MCLK rates of $128 \times f_s$, $256 \times f_s$, or $512 \times f_s$.

The device supports SCLK rates of $32 \times f_s$, $48 \times f_s$ or $64 \times f_s$.

The device supports FSYNC rates of 44.1 kHz, 48 kHz, or 96 kHz.

The maximum clock frequency is 25 MHz. Therefore, for a 96-kHz FSYNC rate, the maximum MCLK rate is $256 \times f_s$.

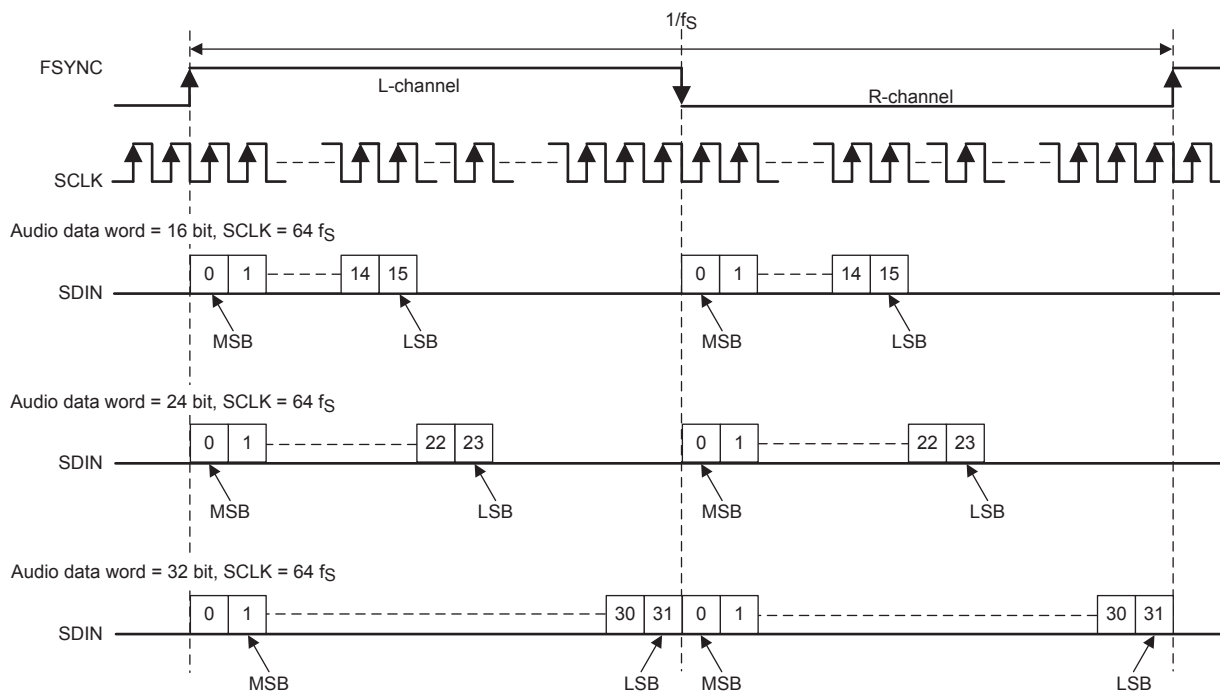

The MCLK clock must not be in phase to sync to SCLK. Duty cycle of 50% is required for 128x FSYNC, for 256x and 512x 50% duty is not required.

10.3.1.6 Audio-Clock Error Handling

When any kind of clock error, MCLK-FSYNC or SCLK-FSYNC ratio, or clock halt is detected, the device puts all channels into the Hi-Z state. When all audio clocks are within the expected range, the device automatically returns to the state it was in. See the [Timing Requirements](#) table for timing requirements.

37. Left-Justified Audio Data Format

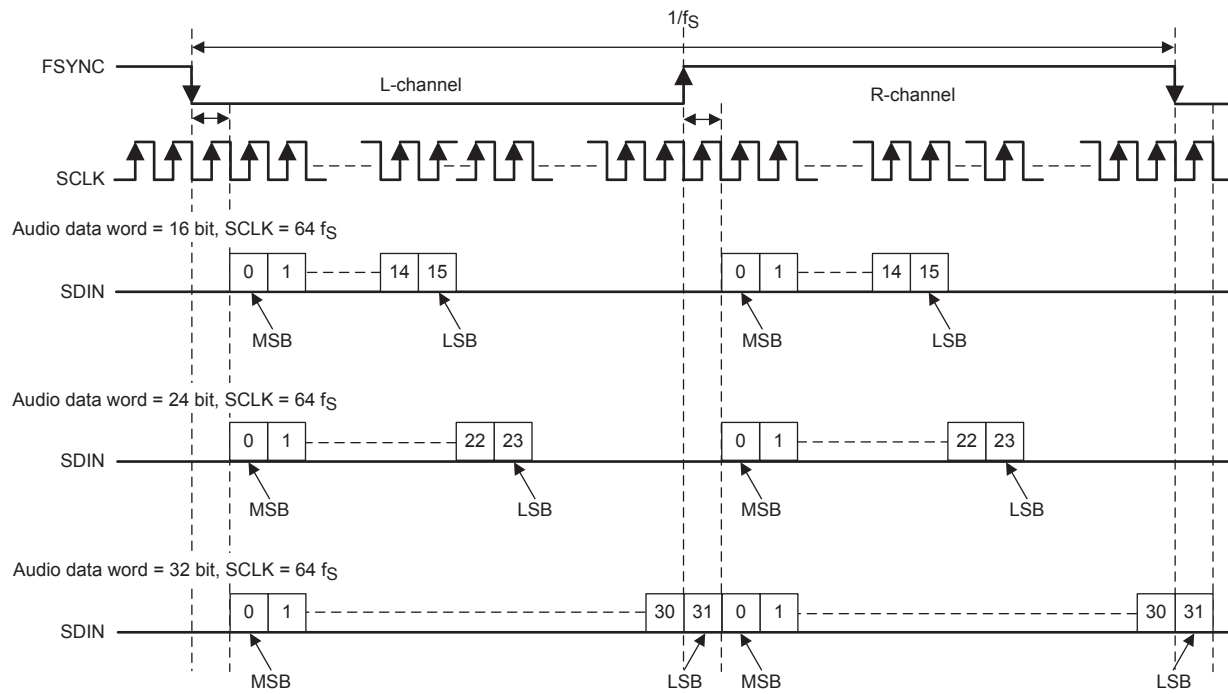

图 38. I²S Audio Data Format

Audio Data Format: TDM8 mode

☒ 39. TDM Audio Data Format

10.3.2 High-Pass Filter

Direct-current (DC) content in the audio signal can damage speakers. The data path has a high-pass filter to remove any DC from the input signal. The corner frequency is selectable from 4 Hz, 8 Hz, or 15 Hz to 30 Hz with bits 0 through 3 in register 0x26. The default value of –3 dB is approximately 4 Hz for 44.1 kHz or 48 kHz and approximately 8 Hz for 96-kHz sampling rates.

10.3.3 Volume Control and Gain

Each channel has a independent digital-volume control with a range from –100 dB to +24 dB with 0.5-dB steps. The volume control is set through I²C. The gain-ramp rate is programmable through I²C to take one step every 1, 2, 4, or 8 FSYNC cycles.

The peak output-voltage swing is also configurable in the gain control register through I²C. The four gain settings are 7.5 V, 15 V, 21 V, and 29 V. TI recommends selecting the lowest possible for the expected PVDD operation to optimize output noise and dynamic range performance.

10.3.4 High-Frequency Pulse-Width Modulator (PWM)

The PWM converts the PCM input data into a switched signal of varying duty cycle. The PWM modulator is an advanced design with high bandwidth, low noise, low distortion, and excellent stability. The output switching rate is synchronous to the serial audio-clock input and is programmed through I²C to be between 8x and 48x the input-sample rate. The option to switch at high frequency allows the use of smaller and lower cost external filtering components. 表 3 lists the switch frequency options for bits 4 through 6 in the miscellaneous control 2 register (address 0x02).

表 3. Output Switch Frequency Option

INPUT SAMPLE RATE	BIT 6:4 SETTINGS					
	000	001	010 to 100	101	110	111
44.1 kHz	352.8 kHz	441 kHz	RESERVED	1.68 MHz	1.94 MHz	2.12 MHz
48 kHz	384 kHz	480 kHz	RESERVED	1.82 MHz	2.11 MHz	Not supported
96 kHz	384 kHz	480 kHz	RESERVED	1.82 MHz	2.11 MHz	Not supported

10.3.5 Gate Drive

The gate driver accepts the low-voltage PWM signal and level shifts it to drive a high-current, full-bridge, power-FET stage. The device uses proprietary techniques to optimize EMI and audio performance.

The gate-driver power-supply voltage, GVDD, is internally generated and a decoupling capacitor is connected at pin 9 and pin 10.

The full H-bridge output stages use only NMOS transistors. Therefore, bootstrap capacitors are required for the proper operation of the high side NMOS transistors. A 1-μF ceramic capacitor of quality X7R or better, rated for at least 16 V, must be connected from each output to the corresponding bootstrap input (see the application circuit diagram in 图 79). The bootstrap capacitors connected between the BST pins and corresponding output function as a floating power supply for the high-side N-channel power MOSFET gate drive circuitry. During each high-side switching cycle, the bootstrap capacitors hold the gate-to-source voltage high keeping the high-side MOSFETs turned on.

10.3.6 Power FETs

The BTL output for each channel comprises four N-channel 90-mΩ FETs for high efficiency and maximum power transfer to the load. These FETs are designed to handle the fast switching frequency and large voltage transients during load dump.

10.3.7 Load Diagnostics

The device incorporates both DC-load and AC-load diagnostics which are used to determine the status of the load. The DC diagnostics are turned on by default but if a fast startup without diagnostics is required the DC diagnostics can be bypassed through I²C. The DC diagnostics runs when any channel is directed to leave the Hi-Z state and enter the MUTE or PLAY state. The DC diagnostics can also be enabled manually to run on any or all channels even if the other channels are playing audio. DC Diagnostics can be started from any operating

condition but if the channel is in play state then the time to complete the diagnostic is longer because the device must ramp down the audio signal of that channel before transitioning to the Hi-Z state. The DC diagnostics are available as soon as the device supplies are within the recommended operating range. The DC diagnostics do not rely on the audio input clocks to be available to function. DC Diagnostic results are reported for each channel separately through the I²C registers.

10.3.7.1 DC Load Diagnostics

The DC load diagnostics are used to verify the load connected. The DC diagnostics consists of four tests: short-to-power (S2P), short-to-ground (S2G), open-load (OL), and shorted-load (SL). The S2P and S2G tests trigger if the impedance to GND or a power rail is below that specified in the *Specifications* section. The diagnostic detects a short to vehicle battery even when the supply is boosted. The SL test has an I²C-configurable threshold depending on the expected load to be connected. Because the speakers connected to each channel might be different, each channel can be assigned a unique threshold value. The OL test reports if the select channel has a load impedance greater than the limits in the *Specifications* section.

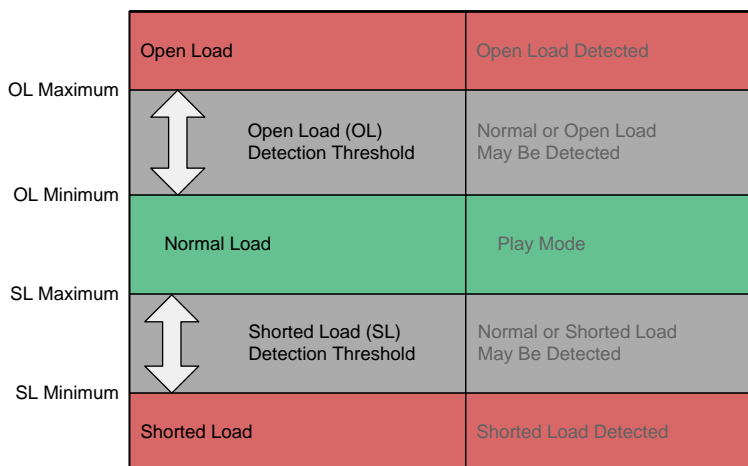

图 40. DC Load Diagnostic Reporting Thresholds

10.3.7.2 Line Output Diagnostics

The device also includes an optional test to detect a line-output load. A line-output load is a high-impedance load that is above the open-load (OL) threshold such that the DC-load diagnostics report an OL condition. After an OL condition is detected on a channel, if the line output detection bit is also set, the channel checks if a line-output load is present as well. This test is not pop free, so if an external amplifier is connected it should be muted.

10.3.7.3 AC Load Diagnostics

The AC load diagnostic is used to determine the proper connection of a capacitively coupled speaker or tweeter when used with a passive crossover. The AC load diagnostic is controlled through I²C. The AC diagnostics requires an external input signal and reports the approximate load impedance and phase. The selected signal frequency should create current flow through the desired speaker for proper detection. If multiple channels must be tested, the diagnostics should be run in series. The AC load-diagnostic test procedure is as follows.

For load-impedance detection, use the following test procedure:

1. Set the channels to be tested into the Hi-Z state.
2. Set the AC_DIAGS_LOOPBACK bit (bit 7 in register 0x16) to 0.
3. Apply a full-scale input signal from the DSP for the tested channels with the desired frequency (recommended 10 kHz to 20 kHz).

注

The device ramps the signal up and down automatically to prevent pops and clicks.

4. Set the device into the AC diagnostic mode (set bits 3:0 in register 0x15 to 1 for CH1 to CH4, set bit 3 in register 0x15 to 1, and set bit 1 in register 0x15 to 1 for PBT12 and PBT134).

5. Read back the AC impedance (register 0x17 through register 0x1A).

When the test is complete the channel reporting register indicates the status change from the AC diagnostic mode to the Hi-Z state. The detected impedance is stored in the appropriate I²C register.

For loopback delay detection, use the following test procedure for either BTL mode or PBTL mode:

- BTL mode

1. Set the AC_DIAGS_LOOPBACK bit (bit 7 in register 0x16) to 1 to enable AC loopback mode.
2. Apply a 0-dBFS 19K signal and enable AC load diagnostics. CH1 and CH2 reuse the AC sensing loop of CH1 (set bit 3 in register 0x15 to 1). CH3, CH4 reuse the AC sensing loop of CH3 (set bit 1 in register 0x15 to 1)
3. Read back the AC_LDG_PHASE1 value (register 0x1B and register 0x1C).

When the test is complete, the channel reporting register indicates the status change from the AC diagnostic mode to the Hi-Z state. The detected impedance is stored in the appropriate I²C register.

- PBTL mode

1. Set the AC_DIAGS_LOOPBACK bit (bit 7 in register 0x16) to 1 to enable AC loopback mode.
2. Set the PBTL CH12 and PBTL CH34 bits (bits 5 and 4 in register 0x00) to 0 without toggling SDz pin to enter BTL mode only for load diagnostics.
3. Apply a 0-dBFS 19K signal and enable AC load diagnostics. For PBTL_12, enable the AC sensing loop of CH1 (set bit 3 in register 0x15 to 1). For PBTL_34, enable the AC sensing loop of CH3 (set bit 1 in register 0x15 to 1).
4. Read back the AC_LDG_PHASE1 (register 0x1B and register 0x1C).
5. Set the PBTL CH12 and PBTL CH34 bits (bits 5 and 4 in register 0x00) to 1 to go back to PBTL mode for load diagnostics.

表 4. AC Impedance Code to Magnitude

SETTING	GAIN AT 19 kHz	I(A)	MEASUREMENT RANGE (Ω)	MAPPING FROM CODE TO MAGNITUDE (Ω/Code)
Gain = 4, I = 10 mA (recommended)	4.28	0.01	12	0.05832
Gain = 4, I = 19 mA	4.28	0.019	6	0.0307
Gain = 1, I = 10 mA (recommended)	1	0.01	48	0.2496
Gain = 1, I = 19 mA	1	0.019	24	0.1314

10.3.8 Protection and Monitoring

10.3.8.1 Overcurrent Limit (I_{LIMIT})

The overcurrent limit terminates each PWM pulse to limit the output current flow when the current limit (I_{LIMIT}) is exceeded. Power is limited but operation continues without disruption and prevents undesired shutdown for transient music events. I_{LIMIT} is not reported as a fault condition to either registers or the FAULT pin. Each channel is independently monitored and limited. The two programmable levels can be set by bit 4 in the miscellaneous control 1 register (address 0x01).

10.3.8.2 Overcurrent Shutdown (I_{SD})

If the output load current reaches I_{SD} , such as an output short to GND, then a peak current limit occurs which shuts down the channel. The time to shutdown the channel varies depending on the severity of the short condition. The affected channel is placed into the Hi-Z state, the fault is reported to the register, and the FAULT pin is asserted. If the diagnostics are enabled then the device automatically starts diagnostics on the channel and, if no load failure is found, the device restarts. If a load fault is found the device continues to rerun the diagnostics once per second. Because this hiccup mode is using the diagnostics, no high current is created. If the diagnostics are disabled the device sets the state for that channel to Hi-Z and requires the MCU to take the appropriate action.

There are two programmable levels that can be set by bit 4 in the miscellaneous control 1 register (address 0x01).

10.3.8.3 DC Detect

This circuit detects a DC offset continuously during normal operation at the output of the amplifier. If the DC offset exceeds the threshold, that channel is placed in the Hi-Z state, the fault is reported to the I²C register, and the FAULT pin is asserted. A register bit can be used to mask reporting to the FAULT pin if needed.

10.3.8.4 Clip Detect

The clip detect is reported on the $\overline{\text{WARN}}$ pin if 100% duty-cycle PWM is reached for a minimum of 20 cycles. If any channel is clipping, the clipping is reported to the pin. The clip detect is latched and can be cleared by I²C. Masking the clip reporting to the pin is possible through I²C.

10.3.8.5 Global Overtemperature Warning (OTW), Overtemperature Shutdown (OTSD)

Four overtemperature warning levels are available in the device that can be selected (see the [Register Maps](#) section for thresholds). When the junction temperature exceeds the warning level, the $\overline{\text{WARN}}$ pin is asserted unless the mask bit has been set to disable reporting. The device functions until the OTSD value is reached at which point all channels are placed in the Hi-Z state and the FAULT pin is asserted. When the junction temperature returns to normal levels, the device automatically recovers and places all channels into the state indicated by the register settings.

10.3.8.6 Channel Overtemperature Warning [OTW(i)] and Shutdown [OTSD(i)]

In addition to the global OTW, each channel also has an individual overtemperature warning and shutdown. If a channel exceeds the OTW(i) threshold, the warning register bit is set as the $\overline{\text{WARN}}$ pin is asserted unless the mask bit has been set to disable reporting. If the channel temperature exceeds the OTSD(i) threshold then that channel goes to the Hi-Z state until the temperature drops below the OTW(i) threshold at which point the channel goes to the state indicated by the state control register.

10.3.8.7 Undervoltage (UV) and Power-On-Reset (POR)

The undervoltage (UV) protection detects low voltages on the PVDD and VBAT pins. In the event of an UV condition, the $\overline{\text{FAULT}}$ pin is asserted and the I²C register is updated. A power-on reset (POR) on the VDD pin causes the I²C to go to the high-impedance (Hi-Z) state and all registers are reset to default values. At power-on or after a POR event, the POR warning bit and $\overline{\text{WARN}}$ pin are asserted.

10.3.8.8 Overvoltage (OV) and Load Dump

The overvoltage (OV) protection detects high voltages on the PVDD pin. If the PVDD pin reaches the OV threshold, the $\overline{\text{FAULT}}$ pin is asserted and the I²C register is updated. The device can withstand 40-V load-dump voltage spikes.

10.3.9 Power Supply

The device has three power supply inputs, VDD, PVDD, and VBAT, which are described as follows:

- VDD** This pin is a 3.3-V supply pin that provides power to the low voltage circuitry.
- VBAT** This pin is a higher voltage supply that can be connected to the vehicle battery or the regulated voltage rail in a boosted system within the recommended limits. For best performance, this rail should be 10 V or higher. See the [Recommended Operating Conditions](#) table for the maximum supply voltage. This supply rail is used for higher voltage analog circuits but not the output FETs.
- PVDD** This pin is a high-voltage supply that can either be connected to the vehicle battery or to another voltage rail in a boosted system. The PVDD pin supplies the power to the output FETs and can be within the recommended operating limits, even if that is below the VBAT supply, to allow for dynamic voltage systems.

Several on-chip regulators are included generating the voltages necessary for the internal circuitry. The external pins are provided only for bypass capacitors to filter the supply and should not be used to power other circuits.

The device can withstand fortuitous open ground and power conditions within the absolute maximum ratings for the device. Fortuitous open ground usually occurs when a speaker wire is shorted to ground, allowing for a second ground path through the body diode in the output FETs.

10.3.9.1 Vehicle-Battery Power-Supply Sequence

The device can accept any sequence of the VBAT, PVDD and VDD supply.

In a typical system, the VBAT and PVDD supplies are both connected to the vehicle battery and power up at the same time. The VDD supply should be applied after the VBAT and PVDD supplies are within the recommended operating range. When removing power from the device, TI recommends to deassert the VDD supply first then the VBAT, PVDD, or both supplies which provides the lowest click and pop performance.

10.3.9.2 Boosted Power-Supply Sequence

In this case, the VBAT and PVDD inputs are not connected to the same supply.

When powering up, apply the VBAT supply first, the VDD supply second, and the PVDD supply last.

When powering down, remove the PVDD supply first, the VDD supply second, and the VBAT supply last.

10.3.10 Hardware Control Pins

The device has four pins for control and device status: $\overline{\text{FAULT}}$, $\overline{\text{MUTE}}$, $\overline{\text{WARN}}$, and $\overline{\text{STANDBY}}$.

10.3.10.1 $\overline{\text{FAULT}}$

The $\overline{\text{FAULT}}$ pin reports faults and is active low under any of the following conditions:

- Any channel faults (overcurrent or DC detection)
- Overtemperature shutdown
- Overvoltage or undervoltage conditions on the VBAT or PVDD pins
- Clock errors

The $\overline{\text{FAULT}}$ pin is deactivated when none of the previously listed conditions exist.

Register bits are available to mask fault categories from reporting to the $\overline{\text{FAULT}}$ pin. These bits only mask the setting of the pin and do not affect the register reporting or protection of the device. By default all faults are reported to the pin. See the [Register Maps](#) section for a description of the mask settings.

This pin is an open-drain output with an internal 100-k Ω pullup resistor to VDD.

10.3.10.2 $\overline{\text{WARN}}$

This active-low output pin reports audio clipping, overtemperature warnings, and POR events.

Clipping is reported if any channel is at the maximum modulation for 20 consecutive PWM clocks which results in a 10- μ s delay to report the onset of clipping. The warning bit is sticky and can be cleared by the CLEAR FAULT bit (bit 7) in register 0x21.

An overtemperature warning (OTW) is reported if the general temperature or any of the channel temperature warnings are set. The warning temperature can be set through bits 5 and 6 in register 0x01.

Register bits are available to mask either clipping or OTW reporting to the pin. These bits only mask the setting of the pin and do not affect the register reporting. By default both clipping and OTW are reported.

The $\overline{\text{WARN}}$ pin is latched and can be cleared by writing the CLEAR FAULT bit (bit 7) in register 0x21.

This pin is an open-drain output with an internal 100-k Ω pullup resistor to VDD.

10.3.10.3 $\overline{\text{MUTE}}$

This active-low input pin is used for hardware control of the mute and unmute function for all channels.

This pin has a 100-k Ω internal pulldown resistor.

10.3.10.4 $\overline{\text{STANDBY}}$

When this active-low input pin is asserted, the device goes into shutdown and current draw is limited. This pin can be used to shut down the device rapidly. The outputs are ramped down in less than 5 ms if the device is not already in the Hi-Z state. The I²C bus goes into the high-impedance (Hi-Z) state when in $\overline{\text{STANDBY}}$.

This pin has a 100-k Ω internal pulldown resistor.

10.4 Device Functional Modes

10.4.1 Operating Modes and Faults

The operating modes and faults are listed in the following tables.

表 5. Operating Modes

STATE NAME	OUTPUT FETS	OSCILLATOR	I ² C
STANDBY	Hi-Z	Stopped	Stopped
Hi-Z	Hi-Z	Active	Active
MUTE	Switching at 50%	Active	Active
PLAY	Switching with audio	Active	Active

表 6. Global Faults and Actions

FAULT/ EVENT	FAULT/EVENT CATEGORY	MONITORING MODES	REPORTING METHOD	ACTION RESULT
POR	Voltage fault	All	I ² C + $\overline{\text{WARN}}$ pin	Standby
VBAT UV		Hi-Z, mute, normal	I ² C + $\overline{\text{FAULT}}$ pin	Hi-Z
PVDD UV				
VBAT or PVDD OV				
OTW	Thermal warning	Hi-Z, mute, normal	I ² C + $\overline{\text{WARN}}$ pin	None
OTSD	Thermal shutdown	Hi-Z, mute, normal	I ² C + $\overline{\text{FAULT}}$ pin	Hi-Z

表 7. Channel Faults and Actions

FAULT/ EVENT	FAULT/EVENT CATEGORY	MONITORING MODES	REPORTING METHOD	ACTION TYPE
Clipping	Warning	Mute and play	$\overline{\text{WARN}}$ pin	None
Overcurrent limiting	Protection			Current limit
Overcurrent fault	Output channel fault		I ² C + $\overline{\text{FAULT}}$ pin	Hi-Z
DC detect				

10.5 Programming

10.5.1 I²C Serial Communication Bus

The device communicates with the system processor through the I²C serial communication bus as an I²C slave-only device. The processor can poll the device through I²C to determine the operating status, configure settings, or run diagnostics. For a complete list and description of all I²C controls, see the [Register Maps](#) section.

The device includes two I²C address pins, so up to four devices can be used together in a system with no additional bus switching hardware. The I²C ADDR_x pins set the slave address of the device as listed in [表 8](#).

表 8. I²C Addresses

DESCRIPTION	I ² C ADDR1	I ² C ADDR0	I ² C Write	I ² C Read
Device 0	0	0	0xD4	0xD5
Device 1	0	1	0xD6	0xD7
Device 2	1	0	0xD8	0xD9
Device 3	1	1	0xDA	0xDB

10.5.2 I²C Bus Protocol

The device has a bidirectional serial-control interface that is compatible with the Inter IC (I²C) bus protocol and supports 100-kbps and 400-kbps data transfer rates for random and sequential write and read operations. The TAS6424-Q1 device is a slave-only device that does not support a multimaster bus environment or wait-state insertion. The control interface is used to program the registers of the device and to read device status.

The I²C bus uses two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system. Data is transferred on the bus serially, one bit at a time. The address and data are transferred in byte (8-bit) format with the most-significant bit (MSB) transferred first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data terminal (SDA) while the clock is HIGH to indicate a start and stop conditions. A HIGH-to-LOW transition on SDA indicates a start, and a LOW-to-HIGH transition indicates a stop. Normal data bit transitions must occur within the low time of the clock period. The master generates the 7-bit slave address and the read/write (R/W) bit to open communication with another device and then wait for an acknowledge condition. The device holds SDA LOW during the acknowledge-clock period to indicate an acknowledgment. When this occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus a R/W bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection. An external pullup resistor must be used for the SDA and SCL signals to set the HIGH level for the bus. The number of bytes that can be transmitted between start and stop conditions is unlimited. When the last word transfers, the master generates a stop condition to release the bus.

Figure 41. Typical I²C Sequence

Figure 42. SCL and SDA Timing

Use the I²C ADDR_x pins to program the device slave address. Read and write data can be transmitted using single-byte or multiple-byte data transfers.

10.5.3 Random Write

As shown in [Figure 43](#), a single-byte data-write transfer begins with the master device transmitting a start condition followed by the I²C device address and the R/W bit. The R/W bit determines the direction of the data transfer. For a write data transfer, the R/W bit is a 0. After receiving the correct I²C device address and the R/W bit, the device responds with an acknowledge bit. Next, the master transmits the address byte or bytes corresponding to the internal memory address being accessed. After receiving the address byte, the device again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the device again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data-write transfer.

FIG 43. Random Write Transfer

10.5.4 Sequential Write

A sequential data-write transfer is identical to a single-byte data-write transfer except that multiple data bytes are transmitted by the master to the device as shown in FIG 44. After receiving each data byte, the device responds with an acknowledge bit and the I²C subaddress is automatically incremented by one.

FIG 44. Sequential Write Transfer

10.5.5 Random Read

As shown in FIG 45, a single-byte data-read transfer begins with the master device transmitting a start condition followed by the I²C device address and the R/W bit. For the data-read transfer, both a write followed by a read occur. Initially, a write occurs to transfer the address byte or bytes of the internal memory address to be read. As a result, the R/W bit is a 0. After receiving the address and the R/W bit, the device responds with an acknowledge bit. In addition, after sending the internal memory address byte or bytes, the master device transmits another start condition followed by the address and the R/W bit again. This time the R/W bit is a 1, indicating a read transfer. After receiving the address and the R/W bit, the device again responds with an acknowledge bit. Next, the device transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the single-byte data-read transfer.

FIG 45. Random Read Transfer

10.5.6 Sequential Read

A sequential data-read transfer is identical to a single-byte data-read transfer except that multiple data bytes are transmitted by the device to the master device as shown in FIG 46. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte and automatically increments the I²C subaddress by one. After receiving the last data byte, the master device transmits a not-acknowledge bit followed by a stop condition to complete the transfer.

46. Sequential Read Transfer

11 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

11.1 Application Information

The TAS6424-Q1 is a four-channel class-D digital-input audio-amplifier design for use in automotive head units and external amplifier modules. The TAS6424-Q1 incorporates the necessary functionality to perform in demanding OEM applications.

11.1.1 AM-Radio Band Avoidance

AM-radio frequency interference can be avoided by setting the switching frequency of the device above the AM band. The switching frequency options available are $38 f_s$, $44 f_s$, and $48 f_s$. If the switch frequency cannot be set above the AM band, then use the two options of $8 f_s$ and $10 f_s$. These options should be changed to avoid AM active channels.

11.1.2 Parallel BTL Operation (PBTL)

The device can drive more current-parallel BTL channels on the load side of the LC output filter. For parallel operation, the parallel BTL mode, PBTL, must be used and the paralleled channels must have the same state in the state control register. If the two states are not aligned the device reports a fault condition.

To set the requested channels to PBTL mode the device must be in standby mode for the commands to take effect.

A load diagnostic is supported for PBTL channels. Paralleling on the device side of the LC output filter is not supported.

11.1.3 Demodulation Filter Design

The amplifier outputs are driven by high-current LDMOS transistors in an H-bridge configuration. These transistors are either fully off or fully on. The result is a square-wave output signal with a duty cycle that is proportional to the amplitude of the audio signal. An LC demodulation filter is used to recover the audio signal. The filter attenuates the high-frequency components of the output signals that are out of the audio band. The design of the demodulation filter significantly affects the audio performance of the power amplifier. Therefore, to meet the system THD+N requirements, the selection of the inductors used in the output filter should be carefully considered.

11.1.4 Line Driver Applications

In many automotive audio applications, the same head unit must drive either a speaker (with several ohms of impedance) or an external amplifier input (with several kilohms of impedance). The design is capable of supporting both applications and has special line-drive gain and diagnostics. Coupled with the high switching frequency, the device is well suited for this type of application. Set the desired channel in line driver mode through I²C register 0x00, the externally connected amplifier must have a differential impedance from 600 Ω to 4.7 k Ω for the DC line diagnostic to detect the connected external amplifier. [Figure 78](#) shows the recommended external amplifier input configuration.

Application Information (continued)

☒ 78. External Amplifier Input Configuration for Line Driver

11.2 Typical Applications

11.2.1 BTL Application

☒ 79 shows the schematic of a typical 4-channel solution for a head-unit application.

Typical Applications (continued)

☒ 79. Typical 4-Channel BTL Application Schematic

Typical Applications (continued)

11.2.1.1 Design Requirements

Use the following requirements for this design:

- This head-unit example is focused on the smallest solution size for 4 × 50-W output power into 2 Ω with a battery supply of 14.4 V.
- The switching frequency is set above the AM-band with 44 times the input sample rate of 48 kHz which results in a frequency of 2.11 MHz.
- The selection of a 2.11-MHz switch frequency enables the use of a small output inductor value of 3.3 μH which leads to a very small solution size.

11.2.1.2 Power Supplies

The TAS6424-Q1 requires three power supplies. The PVDD supply is the high-current supply in the recommended supply range. The VBAT supply is lower current supply that must be in the recommended supply range. The PVDD and VBAT pins can be connected to the same supply if the recommended supply range for VBAT is maintained. The VDD supply is the 3.3-Vdc logic supply and must be maintained in the tolerance as shown in the [Recommended Operating Conditions](#) table.

11.2.1.3 Communication

All communications to the TAS6424-Q1 are through the I²C protocol. A system controller can communicate with the device through the SDA pins and SCL pins. The TAS6424-Q1 is an I²C slave device and requires a master. The device cannot generate an I²C clock or initiate a transaction. The maximum clock speed accepted by the device is 400 kHz. If multiple TAS6424-Q1 devices are on the same I²C bus, the I²C address must be different for each device. Up to four TAS6424-Q1 devices can be on the same I²C bus.

The I²C bus is shared internally.

注

Complete any internal operations, such as load diagnostics, before reading the registers for the results.

11.2.1.4 Detailed Design Procedure

11.2.1.4.1 Hardware Design

Use the following procedure for the hardware design:

- Determine the input format. The input format can be either I²S or TDM mode. The mode determines the correct pin connections and the I²C register settings.
- Determine the power output that is required into the load. The power requirement determines the required power-supply voltage and current. The output reconstruction-filter components that are required are also driven by the output power.
- With the requirements, adjust the typical application schematic in [Figure 79](#) for the input connections.

11.2.1.4.2 Digital Input and the Serial Audio Port

The TAS6424-Q1 device supports four different digital input formats which are: I²S, Right Justified, Left Justified, and TDM mode. Depending on the format, the device can support 16-, 18-, 20-, 24-, and 32-bit data. The supported frequencies are 96 kHz, 48 kHz, and 44.1 kHz. Please see [Table 13](#) for the I²C register, SAP Control, for the complete matrix to set up the serial audio port.

Typical Applications (continued)

注

Bits 3, 4, and 5 in this register are ignored in all input formats except for TDM. Setting up all the control registers to the system requirements should be done before the device is placed in Mute mode or Play mode. After the registers are setup, use bit 7 in register 0x21 to clear any faults. Then read the fault registers to make sure no faults are present. When no faults are present, use register 0x04 to place the device properly into play mode.

11.2.1.4.3 Bootstrap Capacitors

The bootstrap capacitors provide the gate-drive voltage of the upper N-channel FET. These capacitors must be sized appropriately for the system specification. A special condition can occur where the bootstrap may sag if the capacitor is not sized accordingly. The special condition is just below clipping where the PWM is slightly less than 100% duty cycle with sustained low-frequency signals. Changing the bootstrap capacitor value to 2.2 μF for driving subwoofers that require frequencies below 30 Hz may be necessary.

11.2.1.4.4 Output Reconstruction Filter

The output FETs drive the amplifier outputs in an H-Bridge configuration. These transistors are either fully off or fully on. The result is a square-wave output signal with a duty cycle that is proportional to the amplitude of the audio signal. The amplifier outputs require a reconstruction filter that comprises a series inductor and a capacitor to ground on each output, generally called an LC filter. The LC filter attenuates the PWM frequency and reduces electromagnetic emissions, allowing the reconstructed audio signal to pass to the speakers. refer to the [Class-D LC Filter Design](#), (SLOA119) for a detailed description of proper component description and design of the LC filter based upon the specified load and frequency response. The recommended low-pass cutoff frequency of the LC filter is dependent on the selected switching frequency. The low-pass cutoff frequency can be as high as 100 kHz for a PWM frequency of 2.1 MHz. At a PWM frequency of 384 kHz the low-pass cutoff frequency should be less than 40 kHz. Certain specifications must be understood for a proper inductor. The inductance value is given at zero current, but the TAS6424-Q1 device will have current. Use the inductance versus current curve for the inductor to make sure the inductance does not drop below 2 μH (for $f_{\text{SW}} = 2.1 \text{ MHz}$) at the maximum current provided by the system design. The DCR of the inductor directly affects the output power of the system design. The lower the DCR, the more power is provided to the speakers. The typical inductor DCR for a 4- Ω system is 40 to 50 m Ω and for a 2- Ω system is 20 to 25 m Ω .

11.2.1.5 Application Curves

图 80. THD vs Output Power, 4R

图 81. THD vs Frequency

11.2.2 PBTL Application

图 82 shows a schematic of a typical 2-channel solution for a head unit or external amplifier application where high power into 2 Ω is required.

Typical Applications (continued)

To operate in PBTL mode the output stage must be paralleled according to the schematic in [Figure 82](#). The device can operate in a mix of PBTL and BTL mode. This application can be set up for 3 channels, with one channel in PBTL mode and two channels in BTL mode. The device does not support a parallel configuration all four channels for a one-channel amplifier.

Typical Applications (continued)

82. 2-Channel PBTTL Application Schematic

Typical Applications (continued)

11.2.2.1 Design Requirements

Use the following requirements for this design:

- This head-unit example is focused on the smallest solution size for 2 times 50-W output power into 2 Ω with a battery supply of 14.4 V
- The switching frequency is set above the AM-band with 44 times the input sample rate of 48 kHz which results in a frequency of 2.11 MHz.
- The selection of a 2.11-MHz switch frequency enables the use of a small output inductor value of 3.3 μH which leads to a very small solution size.

11.2.2.1.1 Detailed Design Procedure

As a starting point, refer to the [Detailed Design Procedure](#) section for the BTL application. PBTL mode requires schematic changes in the output stage as shown in [Figure 82](#). The other required changes include setting up the I²C registers correctly (see [Table 13](#)) and selecting which frame or channel to use on each output. Bit 6 in register 0x21 controls the frame selection.

11.2.2.2 Application Curves

Figure 83. THD vs Output Power, 2R

Figure 84. Frequency Response

12 Power Supply Recommendations

The TAS6424-Q1 requires three power supplies. The PVDD supply is the high-current supply in the recommended supply range. The VBAT supply is lower current supply that must be in the recommended supply range. The PVDD and VBAT pins can be connected to the same supply if the recommended supply range for VBAT is maintained. The VDD supply is the 3.3-Vdc logic supply and must be maintained in the tolerance as shown in the [Recommended Operating Conditions](#) table.

13 Layout

13.1 Layout Guidelines

The pinout of the TAS6424-Q1 was selected to provide flowthrough layout with all high-power connections on the right side, and all low-power signals and supply decoupling on the left side.

[Figure 85](#) shows the area for the components in the application example (see the [Typical Applications](#) section).

The TAS6424-Q1 EVM uses a four-layer PCB. The copper thickness was selected as 70 μm to optimize power loss.

Layout Guidelines (continued)

The small value of the output filter provides a small size and, in this case, the low height of the inductor enables double-sided mounting.

The EVM PCB shown in [Figure 85](#) is the basis for the layout guidelines.

13.1.1 Electrical Connection of Thermal pad and Heat Sink

For the DKQ package, the heat sink connected to the thermal pad of the device should be connected to GND. The heat slug must not be connected to any other electrical node.

13.1.2 EMI Considerations

Automotive-level EMI performance depends on both careful integrated circuit design and good system-level design. Controlling sources of electromagnetic interference (EMI) was a major consideration in all aspects of the design. The design has minimal parasitic inductances because of the short leads on the package which reduces the EMI that results from current passing from the die to the system PCB. Each channel also operates at a different phase. The design also incorporates circuitry that optimizes output transitions that cause EMI.

For optimizing the EMI a solid ground layer plane is recommended, for a PCB design that fulfills the CISPR25 level 5 requirements, see the TAS6424-Q1 EVM layout.

13.1.3 General Guidelines

The EVM layout is optimized for low noise and EMC performance.

The TAS6424-Q1 has an exposed thermal pad that is up, away from the PCB. The layout must consider an external heat sink.

Refer to [Figure 85](#) for the following guidelines:

- A ground plane, *A*, on the same side as the device pins helps reduce EMI by providing a very-low loop impedance for the high-frequency switching current.
- The decoupling capacitors on PVDD, *B*, are very close to the device with the ground return close to the ground pins.
- The ground connections for the capacitors in the LC filter, *C*, have a direct path back to the device and also the ground return for each channel is the shared. This direct path allows for improved common mode EMI rejection.
- The traces from the output pins to the inductors, *D*, should have the shortest trace possible to allow for the smallest loop of large switching currents.
- Heat-sink mounting screws, *E*, should be close to the device to keep the loop short from the package to ground.
- Many vias, *F*, stitching together the ground planes can create a shield to isolate the amplifier and power supply.

13.2 Layout Example

图 85. EVM Layout

13.3 Thermal Considerations

The thermally enhanced PowerPAD package has an exposed pad up for connection to a heat sink. The output power of any amplifier is determined by the thermal performance of the amplifier as well as limitations placed on it by the system, such as the ambient operating temperature. The heat sink absorbs heat from the TAS6424-Q1 and transfers it to the air. With proper thermal management this process can reach equilibrium and heat can be continually transferred from the device. Heat sinks can be smaller than that of classic linear amplifier design because of the excellent efficiency of class-D amplifiers. This device is intended for use with a heat sink, therefore, $R_{\theta JC}$ will be used as the thermal resistance from junction to the exposed metal package. This resistance will dominate the thermal management, so other thermal transfers will not be considered. The thermal resistance of $R_{\theta JA}$ (junction to ambient) is required to determine the full thermal solution. The thermal resistance is comprised of the following components:

- $R_{\theta JC}$ of the TAS6424-Q1
- Thermal resistance of the thermal interface material
- Thermal resistance of the heat sink

The thermal resistance of the thermal interface material can be determined from the manufacturer's value for the area thermal resistance (expressed in $^{\circ}\text{C}\cdot\text{mm}^2/\text{W}$) and the area of the exposed metal package. For example, a typical, white, thermal grease with a 0.0254-mm (0.001-inch) thick layer is approximately $4.52^{\circ}\text{C}\cdot\text{mm}^2/\text{W}$. The TAS6424-Q1 in the DKQ package has an exposed area of 47.6 mm^2 . By dividing the area thermal resistance by the exposed metal area determines the thermal resistance for the thermal grease. The thermal resistance of the thermal grease is $0.094^{\circ}\text{C}/\text{W}$

表 41 lists the modeling parameters for one device on a heat sink. The junction temperature is assumed to be 115°C while delivering an average power of 10 watts per channel into a 4- Ω load. The thermal-grease example previously described is used for the thermal interface material. Use 式 1 to design the thermal system.

Thermal Considerations (continued)

$$R_{\theta JA} = R_{\theta JC} + \text{thermal interface resistance} + \text{heat sink resistance} \quad (1)$$

表 41. Thermal Modeling

Description	Value
Ambient Temperature	25°C
Average Power to load	40W (4x 10w)

ΔT inside package	5.6°C (0.7°C/W × 8W)
ΔT through thermal interface material	0.75°C (0.094°C/W × 8W)
Required heat sink thermal resistance	10.45°C/W ([115°C – 25°C – 5.6°C – 0.75°C] / 8W)
System thermal resistance to ambient $R_{\theta JA}$	11.24°C/W

14 デバイスおよびドキュメントのサポート

14.1 ドキュメントのサポート

14.1.1 関連資料

関連資料については、以下を参照してください。

[『PurePath™ Console 3ユーザー・マニュアル』\(SLOU408\)](#)

[『TAS6424-Q1 EVMユーザー・ガイド』\(SLOU453\)](#)

14.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、ti.comのデバイス製品フォルダを開いてください。右上の隅にある「通知を受け取る」をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取れます。変更の詳細については、修正されたドキュメントに含まれている改訂履歴をご覧ください。

14.3 コミュニティ・リソース

以下のリンクから、TIのコミュニティ・リソースにアクセスできます。リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらはTIの仕様を構成するものではなく、必ずしもTIの見解を反映したものではありません。TIの[使用条件](#)を参照してください。

TI E2E™オンライン・コミュニティ TIの**E2E (Engineer-to-Engineer)**コミュニティ。エンジニア間の共同作業を促進するために開設されたものです。e2e.ti.comでは、他のエンジニアに質問し、知識を共有し、アイデアを検討して、問題解決に役立てることができます。

E2Eオーディオ・アンプ・フォーラム TIのオーディオ・アンプを対象とする**E2E (Engineer-to-Engineer)**コミュニティ。エンジニア間の共同作業を促進するために開設されたものです。リアルタイムで質問し、回答を受け取ることができます。

14.4 商標

PowerPAD, PurePath, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

14.5 静電気放電に関する注意事項

これらのデバイスは、限定的なESD(静電破壊)保護機能を内蔵しています。保存時または取り扱い時は、MOSゲートに対する静電破壊を防止するために、リード線同士をショートさせておくか、デバイスを導電フォームに入れる必要があります。

14.6 Glossary

[SLYZ022](#) — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

15 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TAS6424QDKQRQ1	ACTIVE	HSSOP	DKQ	56	1000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	TAS6424	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal
