

TCA9546A 低電圧、4 チャンネル、リセット機能搭載 I²C および SMBus スイッチ

1 特長

- 1 対 4 の双方向変換スイッチ
- I²C バスおよび SMBus 互換
- アクティブ LOW のリセット入力
- 3 本のアドレス・ピンにより、最大 8 個の TCA9546A を I²C バスに接続可能
- I²C バス経由で、任意の組み合わせのチャンネルを選択可能
- 電源オン時は、すべてのスイッチ・チャンネルが選択解除された状態
- 低い R_{ON} のスイッチ
- 1.8V、2.5V、3.3V、5V の各電圧のバス間での電圧レベル変換
- 電源オン時のグリッチなし
- 活線挿抜をサポート
- 小さいスタンバイ電流
- 1.65V~5.5V の動作電源電圧範囲
- 5.5V 許容の入力
- 0~400kHz のクロック周波数
- JESD 78 準拠で 100mA 超のラッチアップ性能
- JESD 22 を超える ESD 保護
 - 4000V、人体モデル (A114-A)
 - 1500V、デバイス帯電モデル (C101)

2 アプリケーション

- サーバー
- ルーター (テレコム・スイッチング機器)
- **ファクトリ・オートメーション**
- I²C スレーブ・アドレス競合がある製品 (複数の同一温度センサなど)

3 概要

TCA9546A は、I²C バスで制御するクワッド双方向変換スイッチです。SCL/SDA のアップストリーム・ペアが、4 つのダウンストリーム・ペア (チャンネル) にファンアウトされます。プログラム可能な制御レジスタの設定により、どのような個別の SCn/SDn チャンネルでも、チャンネルの組み合わせでも選択できます。

アクティブ LOW のリセット入力 ($\overline{\text{RESET}}$) により、TCA9546A はダウンストリームの I²C バスの 1 つが LOW 状態に固着した状況から回復できます。 $\overline{\text{RESET}}$ を LOW にすると、I²C ステート・マシンがリセットされ、すべてのチャンネルが選択解除されます (内部のパワー・オン・リセット機能と同様)。

Revision A (February 2015) から Revision B に変更

Page

•	Changed the Pin Configuration image appearance	4
•	Changed V _{CC} = 3.3 V to V _{CC} = 2.5 V in Figure 15	17

5 概要 (続き)

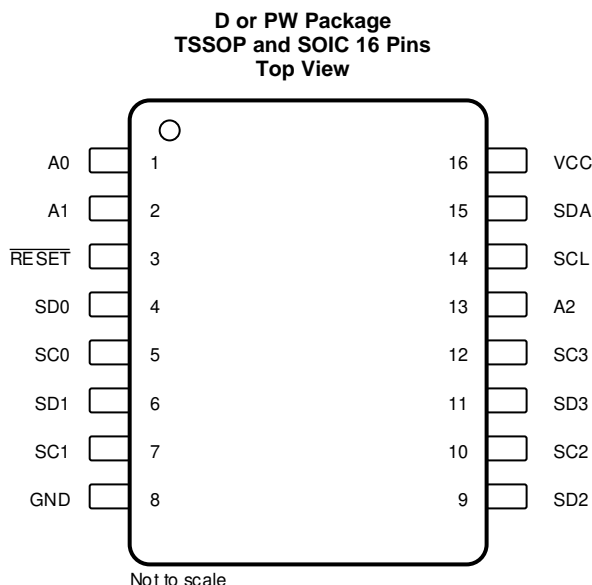

スイッチのパス・ゲートは、TCA9546A が出力する最大 HIGH 電圧を VCC ピンで制限できるように構成されています。これにより、ペアごとに異なるバス電圧を使用できるため、追加保護の必要なしに 1.8V、2.5V、3.3V のデバイスが 5V のデバイスと通信できます。外付けのプルアップ抵抗により、各チャンネルに求められる電圧レベルにバスをプルアップします。すべての I/O ピンは 5.5V 許容です。

6 Pin Configuration and Functions

Pin Functions

PIN		DESCRIPTION
NAME	NO.	
A0	1	Address input 0. Connect directly to V _{CC} or ground.
A1	2	Address input 1. Connect directly to V _{CC} or ground.
$\overline{\text{RESET}}$	3	Active low reset input. Connect to V _{CC} or V _{DPUM} ⁽¹⁾ through a pull-up resistor, if not used.
SD0	4	Serial data 0. Connect to V _{DPU0} ⁽¹⁾ through a pull-up resistor.
SC0	5	Serial clock 0. Connect to V _{DPU0} ⁽¹⁾ through a pull-up resistor.
SD1	6	Serial data 1. Connect to V _{DPU1} ⁽¹⁾ through a pull-up resistor.
SC1	7	Serial clock 1. Connect to V _{DPU1} ⁽¹⁾ through a pull-up resistor.
GND	8	Ground
SD2	9	Serial data 2. Connect to V _{DPU2} ⁽¹⁾ through a pull-up resistor.
SC2	10	Serial clock 2. Connect to V _{DPU2} ⁽¹⁾ through a pull-up resistor.
SD3	11	Serial data 3. Connect to V _{DPU3} ⁽¹⁾ through a pull-up resistor.
SC3	12	Serial clock 3. Connect to V _{DPU3} ⁽¹⁾ through a pull-up resistor.
A2	13	Address input 2. Connect directly to V _{CC} or ground.
SCL	14	Serial clock line. Connect to V _{DPUM} ⁽¹⁾ through a pull-up resistor.
SDA	15	Serial data line. Connect to V _{DPUM} ⁽¹⁾ through a pull-up resistor.
VCC	16	Supply power

(1) V_{DPUX} is the pull-up reference voltage for the associated data line. V_{DPUM} is the master I²C master reference voltage and V_{DPU0}-V_{DPU3} are the slave channel reference voltages.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{CC}	Supply voltage range	-0.5	7	V
V _I	Input voltage range ⁽²⁾	-0.5	7	V
I _I	Input current		±20	mA
I _O	Output current		±25	mA
	Continuous current through V _{CC}		±100	mA
	Continuous current through GND		±100	mA
P _{tot}	Total power dissipation		400	mW
T _A	Operating free-air temperature range	-40	85	°C
T _{stg}	Storage temperature range	-65	150	°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

7.3 Recommended Operating Conditions⁽¹⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage	1.65	5.5	V
V _{IH}	High-level input voltage	SCL, SDA	0.7 × V _{CC}	6
		A2–A0, RESET	0.7 × V _{CC}	V _{CC} + 0.5
V _{IL}	Low-level input voltage	SCL, SDA	-0.5	0.3 × V _{CC}
		A2–A0, RESET	-0.5	0.3 × V _{CC}
T _A	Operating free-air temperature	-40	85	°C

- (1) All unused inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report, *Implications of Slow or Floating CMOS Inputs*, literature number SCBA004.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾	TCA9546A		UNIT	
	D	PW		
	16 PINS	16 PINS		
R _{θJA}	Junction-to-ambient thermal resistance	92.3	122.3	°C/W
R _{θJctop}	Junction-to-case (top) thermal resistance	52.3	56.6	
R _{θJB}	Junction-to-board thermal resistance	50.1	57.4	
ψ _{JT}	Junction-to-top characterization parameter	17.7	10.9	
ψ _{JB}	Junction-to-board characterization parameter	49.8	66.8	

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

7.5 Electrical Characteristics⁽¹⁾

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS		V _{CC}	MIN	TYP ⁽²⁾	MAX	UNIT
V _{PORR}	Power-on reset voltage, V _{CC} rising	No load,	V _I = V _{CC} or GND ⁽³⁾			1.2	1.5	V
V _{PORF}	Power-on reset voltage, V _{CC} falling ⁽⁴⁾	No load,	V _I = V _{CC} or GND ⁽³⁾		0.8	1		
V _{pass}	Switch output voltage	V _{SWin} = V _{CC} ,	I _{SWout} = -100 μA	5 V		3.6		V
				4.5 V to 5.5 V	2.6	4.5		
				3.3 V	1.9			
				3 V to 3.6 V	1.6	2.8		
				2.5 V	1.4			
				2.3 V to 2.7 V	1.0	1.8		
				1.8 V	0.8			
				1.65 V to 1.95 V	0.5	1.1		
I _{OL}	SDA	V _{OL} = 0.4 V		1.65 V to 5.5 V	3	7		mA
		V _{OL} = 0.6 V			6	10		
I _I	SCL, SDA	V _I = V _{CC} or GND ⁽³⁾		1.65 V to 5.5 V			±1	μA
	SC3–SC0, SD3–SD0						±1	
	A2–A0						±1	
	RESET						±1	
I _{CC}	Operating mode	f _{SCL} = 400 kHz	V _I = V _{CC} or GND ⁽³⁾ I _O = 0 t _{r,max} = 300 ns	5.5 V		50		μA
				3.6 V		20		
				2.7 V		11		
				1.65 V		6		
		f _{SCL} = 100 kHz	V _I = V _{CC} or GND ⁽³⁾ I _O = 0 t _{r,max} = 1 μs	5.5 V		35		
				3.6 V		14		
				2.7 V		5		
				1.65 V		2		
	Standby mode	Low inputs	V _I = GND ⁽³⁾ I _O = 0	5.5 V	1.6	2		
				3.6 V	1.0	1.3		
		High inputs	V _I = V _{CC} I _O = 0	2.7 V	0.7	1.1		
				1.65 V	0.4	0.55		
			5.5 V	1.6	2			
			3.6 V	1.0	1.3			
			2.7 V	0.7	1.1			
			1.65 V	0.4	0.55			
ΔI _{CC}	Supply-current change	SCL, SDA	SCL or SDA input at 0.6 V, Other inputs at V _{CC} or GND ⁽³⁾	1.65 V to 5.5 V	2	15	μA	
			SCL or SDA input at V _{CC} - 0.6 V, Other inputs at V _{CC} or GND ⁽³⁾	1.65 V to 5.5 V	2	15		
C _i	A2–A0	V _I = V _{CC} or GND ⁽³⁾		1.65 V to 5.5 V	4.5	6	pF	
	RESET				4.5	5.5		
C _{i(OFF)} ⁽⁵⁾	SCL, SDA	V _I = V _{CC} or GND ⁽³⁾	Switch OFF	1.65 V to 5.5 V	15	19	pF	
	SC3–SC0, SD3–SD0				6	8		

(1) For operation between specified voltage ranges, refer to the worst-case parameter in both applicable ranges.

(2) All typical values are at nominal supply voltage (1.8-V, 2.5-V, 3.3-V, or 5-V V_{CC}), T_A = 25°C.

(3) RESET = V_{CC} (held high) when all other input voltages, V_I = GND.

(4) The power-on reset circuit resets the I²C bus logic with V_{CC} < V_{PORF}.

(5) C_{i(ON)} depends on internal capacitance and external capacitance added to the SCn lines when channels(s) are ON.

Electrical Characteristics⁽¹⁾ (continued)

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS		V _{CC}	MIN	TYP ⁽²⁾	MAX	UNIT
R _{ON}	Switch on-state resistance	V _O = 0.4 V	I _O = 15 mA	4.5 V to 5.5 V	4	10	16	Ω
				3 V to 3.6 V	5	13	20	
		V _O = 0.4 V	I _O = 10 mA	2.3 V to 2.7 V	7	16	45	
				1.65 V to 1.95 V	10	25	70	

7.6 I²C Interface Timing Requirements

over recommended operating free-air temperature range (unless otherwise noted) (see Figure 5)

			STANDARD MODE I ² C BUS		FAST MODE I ² C BUS		UNIT
			MIN	MAX	MIN	MAX	
f _{scl}	I ² C clock frequency		0	100	0	400	kHz
t _{sch}	I ² C clock high time		4		0.6		μs
t _{scl}	I ² C clock low time		4.7		1.3		μs
t _{sp}	I ² C spike time			50		50	ns
t _{sds}	I ² C serial-data setup time		250		100		ns
t _{sdh}	I ² C serial-data hold time		0 ⁽¹⁾		0 ⁽¹⁾		μs
t _{icr}	I ² C input rise time			1000	20 + 0.1C _b ⁽²⁾	300	ns
t _{icf}	I ² C input fall time			300	20 + 0.1C _b ⁽²⁾	300	ns
t _{ocf}	I ² C output fall time	10-pF to 400-pF bus		300	20 + 0.1C _b ⁽²⁾	300	ns
t _{buf}	I ² C bus free time between stop and start		4.7		1.3		μs
t _{sts}	I ² C start or repeated start condition setup		4.7		0.6		μs
t _{sth}	I ² C start or repeated start condition hold		4		0.6		μs
t _{sps}	I ² C stop condition setup		4		0.6		μs
t _{vdL(Data)}	Valid-data time (high to low) ⁽³⁾	SCL low to SDA output low valid		1		1	μs
t _{vdH(Data)}	Valid-data time (low to high) ⁽³⁾	SCL low to SDA output high valid		0.6		0.6	μs
t _{vd(ack)}	Valid-data time of ACK condition	ACK signal from SCL low to SDA output low		1		1	μs
C _b	I ² C bus capacitive load			400		400	pF

(1) A device internally must provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IH} min of the SCL signal), in order to bridge the undefined region of the falling edge of SCL.

(2) C_b = total bus capacitance of one bus line in pF

(3) Data taken using a 1-kΩ pullup resistor and 50-pF load (see Figure 5)

7.7 Switching Characteristics

over recommended operating free-air temperature range, C_L ≤ 100 pF (unless otherwise noted) (see Figure 5)

PARAMETER		FROM (INPUT)	TO (OUTPUT)	MIN	MAX	UNIT
t _{pd} ⁽¹⁾	Propagation delay time	R _{ON} = 20 Ω, C _L = 15 pF	SDA or SCL	SDn or SCn	0.3	ns
		R _{ON} = 20 Ω, C _L = 50 pF			1	

(1) The propagation delay is the calculated RC time constant of the typical ON-state resistance of the switch and the specified load capacitance, when driven by an ideal voltage source (zero output impedance).

7.8 Interrupt and Reset Timing Requirements

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	MAX	UNIT
t_{WL}	Pulse duration, $\overline{\text{RESET}}$ low	6		ns
$t_{rst}^{(1)}$	$\overline{\text{RESET}}$ time (SDA clear)		500	ns
$t_{REC(STA)}$	Recovery time from $\overline{\text{RESET}}$ to start	0		ns

(1) t_{rst} is the propagation delay measured from the time the $\overline{\text{RESET}}$ pin is first asserted low to the time the SDA pin is asserted high, signaling a stop condition. It must be a minimum of t_{WL} .

Parameter Measurement Information (continued)

Figure 6. Reset Timing

9 Detailed Description

9.1 Overview

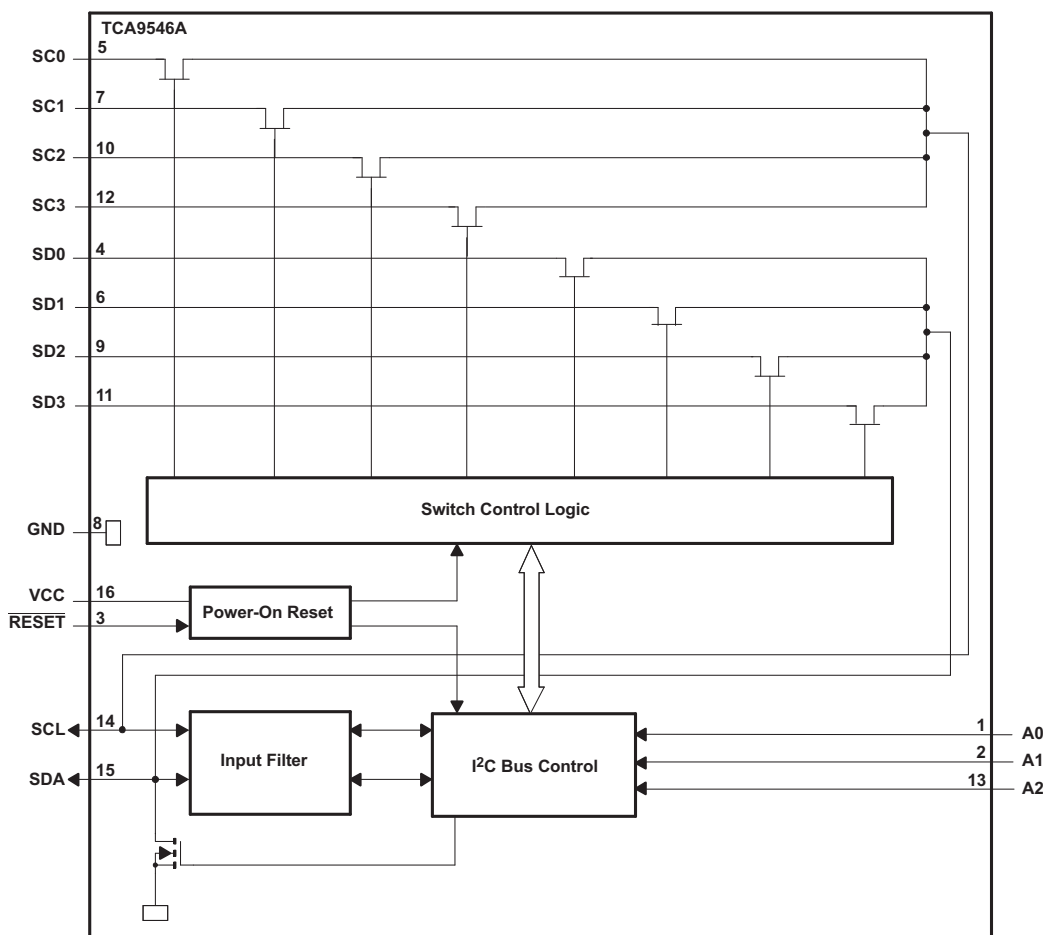

The TCA9546A is a 4-channel, bidirectional translating I²C switch. The master SCL/SDA signal pair is directed to four channels of slave devices, SC0/SD0-SC3/SD3. Any individual downstream channel can be selected as well as any combination of the four channels.

The device offers an active-low $\overline{\text{RESET}}$ input which resets the state machine and allows the TCA9546A to recover should one of the downstream I²C buses get stuck in a low state. The state machine of the device can also be reset by cycling the power supply, V_{CC}, also known as a power-on reset (POR). Both the RESET function and a POR will cause all channels to be deselected.

The connections of the I²C data path are controlled by the same I²C master device that is switched to communicate with multiple I²C slaves. After the successful acknowledgment of the slave address (hardware selectable by A0 and A1 pins), a single 8-bit control register is written to or read from to determine the selected channels.

The TCA9546A may also be used for voltage translation, allowing the use of different bus voltages on each SC_n/SD_n pair such that 1.8-V, 2.5-V, or 3.3-V parts can communicate with 5-V parts. This is achieved by using external pull-up resistors to pull the bus up to the desired voltage for the master and each slave channel.

9.2 Functional Block Diagram

9.3 Feature Description

The TCA9546A is a 4-channel, bidirectional translating switch for I²C buses that supports Standard-Mode (100 kHz) and Fast-Mode (400 kHz) operation. The TCA9546A features I²C control using a single 8-bit control register in which the four least significant bits control the enabling and disabling of the 4 switch channels of I²C data flow. Depending on the application, voltage translation of the I²C bus can also be achieved using the TCA9546A to allow 1.8-V, 2.5-V, or 3.3-V parts to communicate with 5-V parts. Additionally, in the event that communication on the I²C bus enters a fault state, the TCA9546A can be reset to resume normal operation using the $\overline{\text{RESET}}$ pin feature or by a power-on reset which results from cycling power to the device.

9.4 Device Functional Modes

9.4.1 $\overline{\text{RESET}}$ Input

The $\overline{\text{RESET}}$ input is an active-low signal that may be used to recover from a bus-fault condition. When this signal is asserted low for a minimum of t_{WL} , the TCA9546A resets its registers and I²C state machine and deselects all channels. The $\overline{\text{RESET}}$ input must be connected to V_{CC} through a pull-up resistor.

9.4.2 Power-On Reset

When power is applied to V_{CC} , an internal power-on reset holds the TCA9546A in a reset condition until V_{CC} has reached V_{POR} . At this point, the reset condition is released, and the TCA9546A registers and I²C state machine are initialized to their default states, all zeroes, causing all the channels to be deselected. Thereafter, V_{CC} must be lowered below V_{POR} to reset the device.

9.5 Programming

9.5.1 I²C Interface

The I²C bus is for two-way two-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pullup resistor when connected to the output stages of a device. Data transfer can be initiated only when the bus is not busy.

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high period of the clock pulse, as changes in the data line at this time are interpreted as control signals (see [Figure 7](#)).

Figure 7. Bit Transfer

Both data and clock lines remain high when the bus is not busy. A high-to-low transition of the data line while the clock is high is defined as the start condition (S). A low-to-high transition of the data line while the clock is high is defined as the stop condition (P) (see [Figure 8](#)).

Programming (continued)

Figure 8. Definition of Start and Stop Conditions

A device generating a message is a transmitter; a device receiving is the receiver. The device that controls the message is the master, and the devices that are controlled by the master are the slaves (see Figure 9).

Figure 9. System Configuration

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge (ACK) bit. The transmitter must release the SDA line before the receiver can send an ACK bit.

When a slave receiver is addressed, it must generate an ACK after the reception of each byte. Also, a master must generate an ACK after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull down the SDA line during the ACK clock pulse so that the SDA line is stable low during the high pulse of the ACK-related clock period (see Figure 10). Setup and hold times must be taken into account.

Programming (continued)

Figure 10. Acknowledgment on the I²C Bus

Data is transmitted to the TCA9546A control register using the write mode shown in Figure 11.

Figure 11. Write Control Register

Data is read from the TCA9546A control register using the read mode shown in Figure 12.

Figure 12. Read Control Register

9.6 Control Register

9.6.1 Device Address

Following a start condition, the bus master must output the address of the slave it is accessing. The address of the TCA9546A is shown in [Figure 13](#). To conserve power, no internal pullup resistors are incorporated on the hardware-selectable address pins, and they must be pulled high or low.

Figure 13. TCA9546A Address

The last bit of the slave address defines the operation to be performed. When set to a logic 1, a read is selected, while a logic 0 selects a write operation.

9.6.2 Control Register Description

Following the successful acknowledgment of the slave address, the bus master sends a byte to the TCA9546A, which is stored in the control register (see [Figure 14](#)). If multiple bytes are received by the TCA9546A, it will save the last byte received. This register can be written and read via the I²C bus.

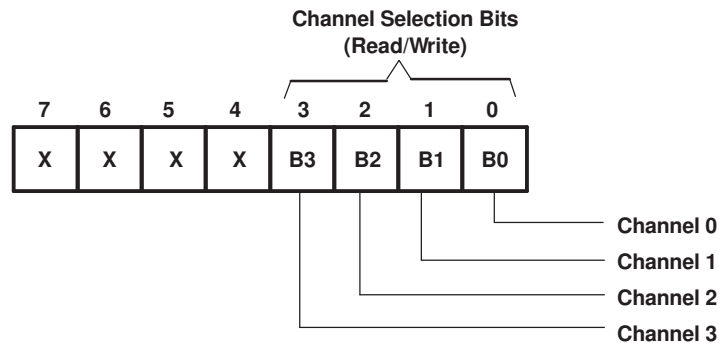

Figure 14. Control Register

9.6.3 Control Register Definition

One or several SC_n/SD_n downstream pairs, or channels, are selected by the contents of the control register (see [Table 1](#)). This register is written after the TCA9546A has been addressed. The four LSBs of the control byte are used to determine which channel or channels are to be selected. When a channel is selected, the channel becomes active after a stop condition has been placed on the I²C bus. This ensures that all SC_n/SD_n lines are in a high state when the channel is made active, so that no false conditions are generated at the time of connection. A stop condition always must occur right after the acknowledge cycle.

Control Register (continued)
Table 1. Control Register Write (Channel Selection), Control Register Read (Channel Status)⁽¹⁾

B7	B6	B5	B4	B3	B2	B1	B0	COMMAND
X	X	X	X	X	X	X	0	Channel 0 disabled
							1	Channel 0 enabled
X	X	X	X	X	X	X	0	Channel 1 disabled
							1	Channel 1 enabled
X	X	X	X	X	X	X	0	Channel 2 disabled
							1	Channel 2 enabled
X	X	X	X	X	X	X	0	Channel 3 disabled
							1	Channel 3 enabled
0	0	0	0	0	0	0	0	No channel selected, power-up/reset default state

(1) Several channels can be enabled at the same time. For example, B3 = 0, B2 = 1, B1 = 1, B0 = 0 means that channels 0 and 3 are disabled, and channels 1 and 2 are enabled. Care should be taken not to exceed the maximum bus capacity.

10 Application and Implementation

10.1 Application Information

Applications of the TCA9546A contains an I²C (or SMBus) master device and up to four I²C slave devices. The downstream channels are ideally used to resolve I²C slave address conflicts. For example, if four identical digital temperature sensors are needed in the application, one sensor can be connected at each channel: 0, 1, 2, and 3. When the temperature at a specific location needs to be read, the appropriate channel can be enabled and all other channels switched off, the data can be retrieved, and the I²C master can move on and read the next channel.

In an application where the I²C bus contain many additional slave devices that do not result in I²C slave address conflicts, these slave devices can be connected to any desired channel to distribute the total bus capacitance across multiple channels. If multiple switches will be enabled simultaneously, additional design requirements must be considered (See [Design Requirements](#) and [Detailed Design Procedure](#)).

10.2 Typical Application

A typical application of the TCA9546A contains anywhere from 1 to 5 separate data pull-up voltages, V_{DPUX} , one for the master device (V_{DPUM}) and one for each of the selectable slave channels ($V_{DPU0} - V_{DPU3}$). In the event where the master device and all slave devices operate at the same voltage, then the pass voltage, $V_{PASS} = V_{DPUX}$. Once the maximum V_{PASS} is known, V_{CC} can be selected easily using [Figure 16](#). In an application where voltage translation is necessary, additional design requirements must be considered (See [Design Requirements](#)).

[Figure 15](#) shows an application in which the TCA9546A can be used.

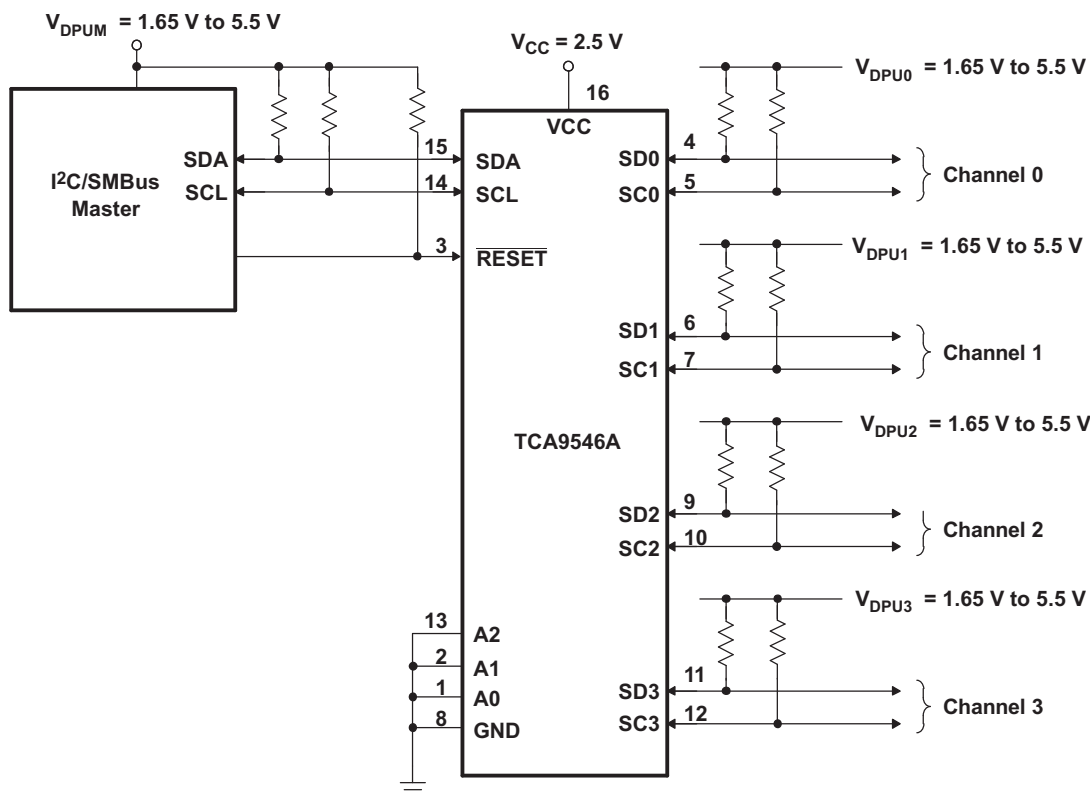

Figure 15. TCA9546A Typical Application Schematic

Typical Application (continued)

10.2.1 Design Requirements

The A0, A1, and A2 pins are hardware selectable to control the slave address of the TCA9546A. These pins may be tied directly to GND or V_{CC} in the application.

If multiple slave channels will be activated simultaneously in the application, then the total I_{OL} from SCL/SDA to GND on the master side will be the sum of the currents through all pull-up resistors, R_p .

The pass-gate transistors of the TCA9546A are constructed such that the V_{CC} voltage can be used to limit the maximum voltage that is passed from one I²C bus to another.

Figure 16 shows the voltage characteristics of the pass-gate transistors (note that the graph was generated using data specified in the [Electrical Characteristics](#) section of this data sheet). In order for the TCA9546A to act as a voltage translator, the V_{pass} voltage must be equal to or lower than the lowest bus voltage. For example, if the main bus is running at 5 V and the downstream buses are 3.3 V and 2.7 V, V_{pass} must be equal to or below 2.7 V to effectively clamp the downstream bus voltages. As shown in Figure 16, $V_{pass(max)}$ is 2.7 V when the TCA9546A supply voltage is 4 V or lower, so the TCA9546A supply voltage could be set to 3.3 V. Pull-up resistors then can be used to bring the bus voltages to their appropriate levels (see Figure 15).

10.2.2 Detailed Design Procedure

Once all the slaves are assigned to the appropriate slave channels and bus voltages are identified, the pull-up resistors, R_p , for each of the buses need to be selected appropriately. The minimum pull-up resistance is a function of V_{DPUX} , $V_{OL(max)}$, and I_{OL} :

$$R_{p(min)} = \frac{V_{DPUX} - V_{OL(max)}}{I_{OL}} \quad (1)$$

The maximum pull-up resistance is a function of the maximum rise time, t_r (300 ns for fast-mode operation, $f_{SCL} = 400$ kHz) and bus capacitance, C_b :

$$R_{p(max)} = \frac{t_r}{0.8473 \times C_b} \quad (2)$$

The maximum bus capacitance for an I²C bus must not exceed 400 pF for fast-mode operation. The bus capacitance can be approximated by adding the capacitance of the TCA9546A, $C_{iO(OFF)}$, the capacitance of wires/connections/traces, and the capacitance of each individual slave on a given channel. If multiple channels will be activated simultaneously, each of the slaves on all channels will contribute to total bus capacitance.

Typical Application (continued)

10.2.3 TCA9546A Application Curves

Figure 16. Pass-Gate Voltage (V_{pass}) vs Supply Voltage (V_{CC}) at Three Temperature Points

Standard-mode ($f_{SCL} = 100 \text{ kHz}$, $t_r = 1 \mu\text{s}$) Fast-mode ($f_{SCL} = 400 \text{ kHz}$, $t_r = 300 \text{ ns}$)

Figure 17. Maximum Pull-Up resistance ($R_{p(max)}$) vs Bus Capacitance (C_b)

$V_{OL} = 0.2 \cdot V_{DPUX}$, $I_{OL} = 2 \text{ mA}$ when $V_{DPUX} \leq 2 \text{ V}$
 $V_{OL} = 0.4 \text{ V}$, $I_{OL} = 3 \text{ mA}$ when $V_{DPUX} > 2 \text{ V}$

Figure 18. Minimum Pull-Up Resistance ($R_{p(min)}$) vs Pull-Up Reference Voltage (V_{DPUX})

11 Power Supply Recommendations

The operating power-supply voltage range of the TCA9546A is 1.65 V to 5.5 V applied at the VCC pin. When the TCA9546A is powered on for the first time or anytime the device needs to be reset by cycling the power supply, the power-on reset requirements must be followed to ensure the I²C bus logic is initialized properly.

11.1 Power-On Reset Requirements

In the event of a glitch or data corruption, TCA9546A can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

A power-on reset is shown in Figure 19.

Figure 19. V_{CC} is Lowered Below the POR Threshold, Then Ramped Back Up to V_{CC}

Table 2 specifies the performance of the power-on reset feature for TCA9546A for both types of power-on reset.

Table 2. Recommended Supply Sequencing And Ramp Rates⁽¹⁾

PARAMETER			MIN	TYP	MAX	UNIT
V _{CC_FT}	Fall time	See Figure 19	1		100	ms
V _{CC_RT}	Rise time	See Figure 19	0.1		100	ms
V _{CC_TRR}	Time to re-ramp (when V _{CC} drops below V _{PORF(min)} – 50 mV or when V _{CC} drops to GND)	See Figure 19	40			μs
V _{CC_GH}	Level that V _{CC} can glitch down to, but not cause a functional disruption when V _{CC_GW} = 1 μs	See Figure 20			1.2	V
V _{CC_GW}	Glitch width that will not cause a functional disruption when V _{CC_GH} = 0.5 × V _{CC}	See Figure 20			10	μs
V _{PORF}	Voltage trip point of POR on falling V _{CC}	See Figure 21	0.8		1.25	V
V _{PORR}	Voltage trip point of POR on rising V _{CC}	See Figure 21	1.05		1.5	V

(1) All supply sequencing and ramp rate values are measured at T_A = 25°C

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (V_{CC_GW}) and height (V_{CC_GH}) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. Figure 20 and Table 2 provide more information on how to measure these specifications.

Figure 20. Glitch Width and Glitch Height

V_{POR} is critical to the power-on reset. V_{POR} is the voltage level at which the reset condition is released and all the registers and the I²C/SMBus state machine are initialized to their default states. The value of V_{POR} differs based on the V_{CC} being lowered to or from 0. Figure 21 and Table 2 provide more details on this specification.

Figure 21. V_{POR}

12 Layout

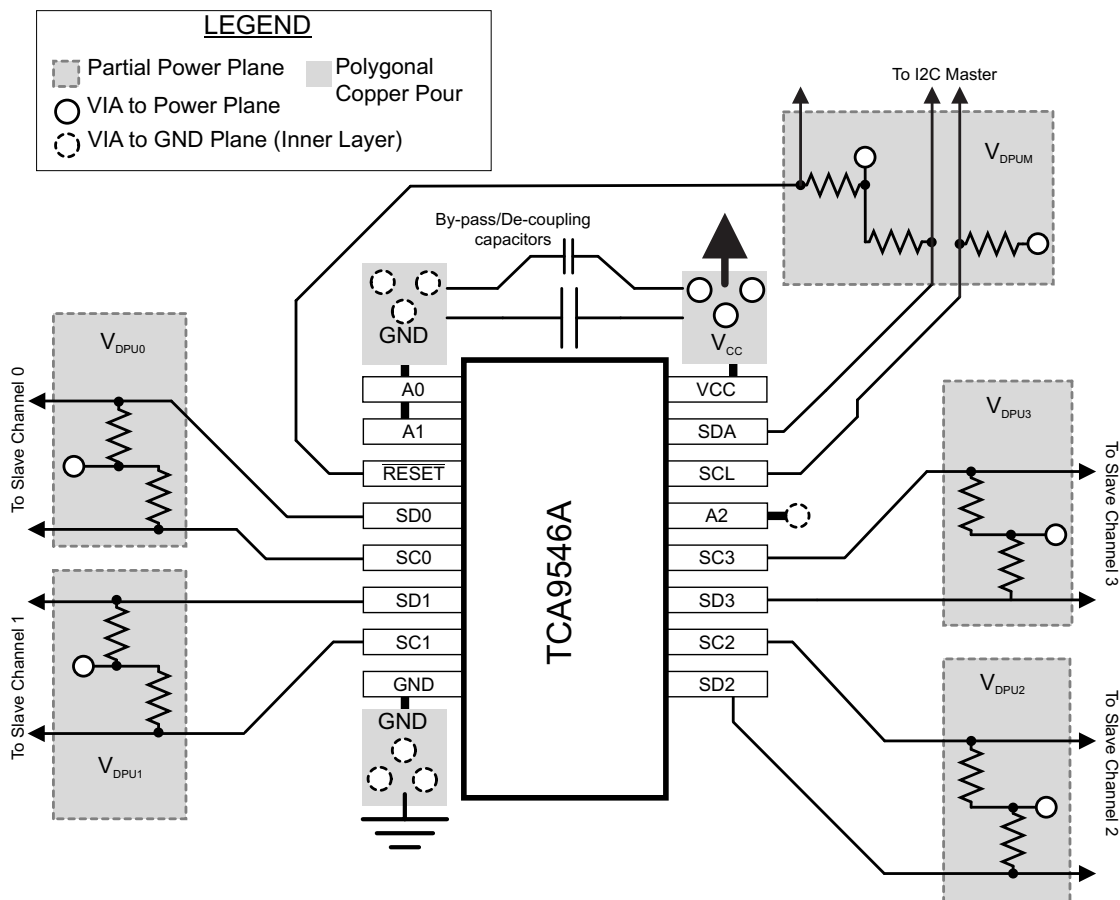

12.1 Layout Guidelines

For PCB layout of the TCA9546A, common PCB layout practices should be followed but additional concerns related to high-speed data transfer such as matched impedances and differential pairs are not a concern for I²C signal speeds. It is common to have a dedicated ground plane on an inner layer of the board and pins that are connected to ground should have a low-impedance path to the ground plane in the form of wide polygon pours and multiple vias. By-pass and de-coupling capacitors are commonly used to control the voltage on the VCC pin, using a larger capacitor to provide additional power in the event of a short power supply glitch and a smaller capacitor to filter out high-frequency ripple.

In an application where voltage translation is not required, all V_{DPUX} voltages and V_{CC} could be at the same potential and a single copper plane could connect all of pull-up resistors to the appropriate reference voltage. In an application where voltage translation is required, V_{DPU0}, V_{DPU1}, V_{DPU2}, and V_{DPU3} may all be on the same layer of the board with split planes to isolate different voltage potentials.

To reduce the total I²C bus capacitance added by PCB parasitics, data lines (SC_n and SD_n) should be as short as possible and the widths of the traces should also be minimized (e.g. 5-10 mils depending on copper weight).

14 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TCA9546ADR	ACTIVE	SOIC	D	16	2500	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	TCA9546A	Samples
TCA9546APWR	ACTIVE	TSSOP	PW	16	2000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	PW546A	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
