

TLV3011-EP および TLV3012-EP エンハンスド製品、低消費電力コンパレータ、1.24V 基準電圧内蔵

1 特長

- VID V62/07604-01XE (TLV3011-EP)
- VID V62/23603-01XE (TLV3012-EP)
- 管理されたベースライン
 - 単一のアセンブリ - テスト施設
 - 単一の製造施設
 - 長い製品ライフ・サイクル
- 拡張 DMS (Diminishing Manufacturing Sources) サポート
- -55°C~125°Cの拡張温度範囲
- 低静止電流: 3.1μA (最大値)
- シリーズ基準電圧内蔵: 1.242V
- 入力同相範囲: レールの 200mV 外まで
- 基準電圧の初期精度: 1%
- オープン・ドレイン出力 (TLV3011-EP)
- プッシュプル出力 (TLV3012-EP)
- 相互ヒステリシス (TLV3012-EP のみ)
- フェイルセーフ入力 (TLV3012-EP のみ)
- パワーオン・リセット (TLV3012-EP のみ)
- 電源電圧範囲: 1.65V~5.5V (TLV3012-EP のみ)
- 迅速な応答時間: 2μs
- 超小型パッケージ: SOT-23-6

2 アプリケーション

- バッテリ駆動の液面検出
- データ・アクイジション
- システム監視
- 発振器
- センサ・システム

TLV3012-EP 基準電圧の分布

3 概要

TLV3011-EP は低消費電力オープン・ドレイン出力のコンパレータです。TLV3012-EP はプッシュプル出力のコンパレータです。どちらのデバイスも、不確定なオンチップ基準電圧を採用しており、静止電流が 3.1μA (最大値)、電源レールを上回る 200mV 入力同相範囲、1.65V~5.5V の単一電源で動作します。

内蔵 1.242V シリーズ基準電圧は、100ppm/°C (最大値) の低ドリフトを実現し、最大 10nF の容量性負荷で安定しており、最大 0.5mA (標準値) の出力電流をシンクまたはソースできるため、外部回路を駆動できます。

TLV3011-EP および TLV3012-EP は、スペースに制約のある設計向けの小型 SOT-23-6 パッケージで供給されます。これらのデバイスは、-55°C~125°Cの拡張温度範囲で動作が規定されています。

表 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
OUT	1	O	Comparator Output
V-	2	P	Negative Supply Voltage
IN+	3	I	Non-Inverting (Positive) Input
IN-	4	I	Inverting (Negative) Input
REF	5	O	Reference Voltage Output
V+	6	P	Positive Supply Voltage

6 Specifications

6.1 Absolute Maximum Ratings - TLV3011-EP

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT	
	Supply voltage		7	V	
	Signal input terminals	Voltage ⁽²⁾	-0.5	(V+) +0.5	V
		Current ⁽²⁾		±10	mA
	Output short circuit ⁽³⁾		Continuous		
	Operating temperature range	-55	125	°C	
T _{stg}	Storage temperature range	-65	150	°C	
T _J	Junction temperature		150	°C	

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the network ground terminal.
- (3) Short circuit to ground

6.2 Absolute Maximum Ratings - TLV3012-EP

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage: V _S = (V+) – (V–)		-0.5	7	V
Input pins (IN+, IN–) from (V–) ⁽²⁾		-0.5	7	V
Output (OUT) (Push-Pull) from (V–)		-0.5	(V+) + 0.5	V
Output short circuit current ⁽³⁾			10	mA
Junction temperature, T _J			150	°C
Storage temperature, T _{stg}		-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Input pins are diode-clamped to (V–). Inputs (IN+, IN–) can be greater than (V+) as long as within the –0.5 V to 7 V range. Inputs beyond –0.3 V must be current-limited to less than –10 mA, while inputs beyond 7 V must be externally voltage clamped.
- (3) Short-circuit to (V–) or (V+).

6.3 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾ (TLV3012-EP Only)	±1000

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

6.4 Thermal Resistance Characteristics

THERMAL METRIC ¹		TLV3011-EP	TLV3012-EP	UNIT

7 Detailed Description

7.1 Overview

The TLV301x-EP is a MicroPower comparator with an integrated reference that is well suited for compact, low-current, precision voltage detection applications. With a high-accuracy, internal reference of 1.242 V and 5 μ A of quiescent current, the TLV301x-EP enables power conscious systems to monitor and respond quickly to fault conditions.

7.2 Functional Block Diagram

7.3 Feature Description

The TLV301x-EP is comprised of a rail-to-rail input comparator with open-drain or push-pull output options and a voltage reference that is externally available.

7.4 Device Functional Modes

The TLV3011-EP requires an operating voltage between 1.8 V and 5.5 V for the comparator output to reflect the voltage applied to the inputs. Similarly, the reference output (REF) will also be valid over the same operating voltage range.

7.4.1 Open Drain Output (TLV3011-EP)

The TLV3011-EP features an Open-Drain (sinking only) output that allows multiple devices to be driven by a single pull-up resistor to accomplish an OR function, making the TLV3011-EP useful for logic applications. The value of the pull-up resistor and supply voltage used will affect current consumption due to additional current drawn when the output is in a low state. This effect can be seen in the typical curve Quiescent Current vs Output Switching Frequency.

The pull-up voltage should NOT exceed the V+ supply.

7.4.2 Push Pull Output (TLV3012-EP)

The TLV3012-EP has a "Push-Pull" output capable of both sinking and sourcing current. The push-pull output stage is optimal for reduced power budget applications by eliminating the need for a pull-up resistor and features no shoot-through current.

Do not tie push-pull outputs together.

7.4.3 Voltage Reference

The TLV301x-EP requires an operating voltage between 1.8 V and 5.5 V for the comparator output to reflect the voltage applied to the inputs. Similarly, the reference output (REF) will also be valid over the same operating voltage range.

The integrated 1.242-V voltage reference offers low 100-ppm/ $^{\circ}$ C (maximum) drift provided on a separate output pin that allows use of external dividers or to provide a reference voltage for other external circuitry. The reference is stable with up to a 10-nF capacitive load and can sink or source up to 500 μ A (typical) of output current.

7.4.4 Fail-Safe Input (TLV3012-EP Only)

This section does **NOT** apply to the open drain output TLV3011-EP.

The TLV3012-EP inputs are Fail-Safe up to 5.5V independent of V+ voltage. Fail-Safe is defined as maintaining the same high input impedance when V+ is unpowered or within the recommended operating ranges.

The Fail-Safe inputs can be any value between 0 V and 5.5 V, even while V+ is zero or ramping up or down. This feature avoids power sequencing issues as long as the input voltage range and supply voltage are within the specified ranges.

This is possible since the inputs are not clamped to V+ and the input current maintains its value even when a higher voltage is applied to the inputs.

As long as one of the input pins remains within the valid input range, and the supply voltage is valid and not in POR, the output state will be correct. The specified input voltage range is -0.2 V to $(V+) + 0.2\text{ V}$.

The following is a summary of the TLV3012-EP device input voltage excursions and their outcomes:

1. When both IN- and IN+ are within the specified input voltage range:
 - a. If IN- is higher than IN+ and the offset voltage, the output is low.
 - b. If IN- is lower than IN+ and the offset voltage, the output is high.
2. When IN- is higher than the specified input voltage range and IN+ is within the specified voltage range, the output is low.
3. When IN+ is higher than the specified input voltage range and IN- is within the specified input voltage range, the output is high
4. When IN- and IN+ are both outside the specified input voltage range, the output state is **indeterminate** (random). *Do not* operate in this region.

Because the inputs do not have upper ESD diode clamps to V+, input voltages must be externally clamped to below 5.5 V if the source could possibly exceed 5.5 V. A current limiting resistor in series with the input is also recommend in case of input transients.

7.4.5 Power-On Reset (POR) (TLV3012-EP Only)

This section does **NOT** apply to the open-drain output TLV3011-EP.

The TLV3012-EP has an internal Power-on-Reset (POR) circuit for known start-up or power-down conditions. While the power supply (V+) is ramping up or ramping down, the POR circuitry will be activated for up to 1.9ms after the minimum supply voltage threshold is crossed, or immediately when the supply voltage drops below minimum supply. When the supply voltage is equal to or greater than the minimum supply voltage, and after the delay period, the comparator output reflects the state of the differential input (V_{ID}). This delay is long enough to allow the reference output to stabilize with up to a 10nF capacitive load.

During the POR period (t_{on}), the outputs will be low (sinking)

8.1 Application Information

The TLV301x-EP comparator family with on-chip 1.242-V series reference with the choice of either open-drain or push-pull output stages.

A typical supply current of 2.8 μA and small packaging combine with 1.8-V supply requirements to make the TLV301x-EP devices optimal for battery and portable designs.

図 8-1 shows the typical connections for the TLV301x-EP device.

(1) Use R_{PULLUP} with the TLV3011 only.

図 8-1. Basic Connections of the TLV301x-EP

8.1.1 External Hysteresis

Comparator inputs have no noise immunity within the range of specified offset voltage (± 12 mV). For noisy input signals, the comparator output may display multiple switching as input signals move through the switching threshold. The typical comparator threshold of the TLV301x-EP is ± 0.5 mV. To prevent multiple switching within the comparason threshold of the comparator, external hysteresis may be added by connecting a small amount of feedback to the positive input. 図 8-2 shows a typical topology used to introduce hysteresis, described by this equation:

$$V_{\text{HYST}} = \frac{V_+ \times R_1}{R_1 + R_2}$$

(1) Use R_{PULLUP} with the TLV3011 only.

図 8-2. Adding Hysteresis

V_{HYST} sets the value of the transition voltage required to switch the comparator output by increasing the threshold region, thereby reducing sensitivity to noise.

8.2 Typical Application

8.2.1 Under Voltage Detection

Under-voltage detection is frequently required to alert the system that a battery voltage has dropped below the usable voltage level. [Figure 8-3](#) shows a simple under-voltage detection circuit using the TLV3012-EP which is configured as a non-inverting comparator with the integrated 1.242 V reference is externally connected to the inverting input pin (IN-).

Figure 8-3. Under-Voltage Detection

8.2.1.1 Design Requirements

For this design, follow these design requirements:

- Operate from power supply that powers the microcontroller.
- Under-voltage alert is active low.
- Logic low output when V_{BAT} is less than 2.0V.

8.2.1.2 Detailed Design Procedure

Configure the circuit as shown in [Figure 8-3](#). Connect (V+) to V_{BAT} which also powers the microcontroller. Resistors R_1 and R_2 create the under-voltage alert level of 2.0 V. When the battery voltage sags down to 2.0 V, the resistor divider voltage crosses V_{REF} , the 1.242 V reference threshold of the TLV3012-EP. This causes the comparator output to transition from a logic high to a logic low. The push-pull output of the TLV3012-EP is selected since the comparator operating voltage is shared with the microcontroller which is receiving the under-voltage alert signal.

[Equation 1](#) is derived from the analysis of [Figure 8-3](#).

$$V_{REF} = \frac{R_2}{R_1 + R_2} \times V_{BAT} \quad (1)$$

where

- R_1 and R_2 are the resistor values for the resistor divider connected to IN+
- V_{BAT} is the voltage source that is being monitored for an undervoltage condition.
- V_{REF} is the falling edge threshold where the comparator output changes state from high to low

Rearranging [Equation 1](#) and solving for R_1 yields [Equation 2](#).

$$R_1 = \frac{(V_{BAT} - V_{REF})}{V_{REF}} \times R_2 \tag{2}$$

For the specific undervoltage detection of 2.0 V using the TLV3012-Q1, the following results are calculated.

$$R_1 = \frac{(2.0 - 1.242)}{1.242} \times 1M = 610 \text{ k}\Omega \tag{3}$$

where:

- R₂ is set to 1 MΩ
- V_{BAT} is set to 2.0 V
- V_{REF} is set to 1.242 V

Choose R_{TOTAL} (R₁ + R₂) such that the current through the divider is at least 100 times higher than the input bias current (I_{BIAS}). The resistors can have high values to minimize current consumption in the circuit without adding significant error to the resistive divider.

8.2.1.3 Application Performance Plots

Figure 8-4.

8.3 Power Supply Recommendations

The TLV3012x-EP has a recommended operating voltage range (V_S) of 1.8 V to 5.5 V. V_S is defined as $(V+) - (V-)$.

Therefore, the supply voltages used to create V_S can be single-ended or bipolar. For example, single-ended supply voltages of 5 V and 0 V and bipolar supply voltages of +2.5 V and –2.5 V create comparable operating voltages for V_S .

However, when bipolar supply voltages are used, it is important to realize that the reference (REF) and logic low level of the comparator output is referenced to $(V-)$. Output capacitive loading and output toggle rate will cause the average supply current to rise over the quiescent current in the EC Table.

8.4 Layout

8.4.1 Layout Guidelines

To minimize supply noise, power supplies should be capacitively decoupled by a 0.1- μ F ceramic capacitor. Comparators are sensitive to input noise and precautions such as proper grounding (use of ground plane), supply bypassing, and guarding of high-impedance nodes minimize the effects of noise and help to ensure specified performance.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
