

# TMP118 超小型、高精度、低消費電力、デジタル温度センサ

## SMBus™ および I<sup>2</sup>C 互換インターフェイス搭載

### 1 特長

- 超小型、超薄型の PicoStar™ パッケージ:
  - サイズ: 0.55 × 0.61 × 0.24mm
  - 小さな熱質量: 0.14mJ/°C
- TMP118 高精度温度センサ
  - 0°C~50°Cで ±0.05°C (標準値)
  - 0°C~50°Cで ±0.1°C (最大値)
  - 20°C~85°Cで ±0.2°C (最大値)
  - 40°C~125°Cで ±0.4°C (最大値)
- 低消費電力:
  - アクティブ電流: 55µA
  - 80nA シャットダウン電流
  - 平均電流: 1.4µA、変換サイクル: 1Hz
- 電源電圧範囲: 1.4V~5.5V
- 1.2V ロジック互換 (電源に依存しない)
- 測定ノイズを低減する 3 つの平均化オプション
- 16 ビット分解能: 0.0078125°C (LSB)
- I<sup>2</sup>C バスおよび SMBus 互換
- I3C 混在バス上での共存に対応
- 温度アラート制限をプログラム可能
- 固有のデバイス ID による NIST トレサビリティ

### 2 アプリケーション

- 携帯電話 / スマートフォン
- スマートウォッチ
- スマート追跡機能
- タブレット
- 医療用センサ パッチ

TMP118 温度精度 (1.8V 電源)

### 3 概要

TMP118 は、業界をリードする 0.55mm × 0.61mm × 0.24mm PICOSTAR パッケージで提供される業界最小の温度センサです。TMP118 は較正不要で、0°C~50°C の温度範囲にわたって 0.0078125°C の分解能、最大 ±0.1°C の精度で 16 ビットの温度結果を提供します。このデバイスは、システムレベルの ASTM E1112 および ISO 80601 の電子医療体温計の精度要件を満たすように設計されています。

TMP118 は最小 1.4V の電源電圧で動作するように設計されています。平均電流、シャットダウン電流はそれぞれ 1.4µA (1Hz 時)、80nA と小さいため、オンデマンドの温度変換が可能であり、バッテリー寿命を最大化できます。TMP118 は、I<sup>2</sup>C および SMBus 互換のインターフェイスとプログラム可能なアラート機能を備えています。メイン電源レールに関係なく最低 1V のロジックレベルをサポートできます。これにより、電圧レベル シフトなしに低電圧 1.2V コントローラとの相互運用が可能になります。

このデバイスは固有の ID を備えており、トレサビリティに優れています。TMP118 ユニットは NIST トレース可能な製造時のセットアップで 100% テスト済みであり、ISO-IEC 17025 で認められた標準に従って較正済みの機器により検証されています。

#### パッケージ情報

| 部品番号 <sup>(1)</sup> | パッケージ           | パッケージサイズ <sup>(2)</sup>     |
|---------------------|-----------------|-----------------------------|
| TMP118              | PICOSTAR<br>(4) | 0.55mm × 0.61mm ×<br>0.24mm |

- 詳細については、[セクション 12](#) を参照してください。
- パッケージサイズ (長さ × 幅) は公称値で、該当する場合はピンも含まれます。

| VDD  | A1         | I                   | Supply voltage   |
| SDA  | B1         | I/O                 | Serial data input and open-drain output. Requires a pullup resistor. |
| GND  | A2         | -                   | Ground   |
| SCL  | B2         | I                   | Serial Clock   |

(1) I = Input; O = Output, I/O = Input or Output

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over free-air temperature range unless otherwise noted<sup>(1)</sup>

|                                       |          | MIN  | MAX | UNIT |
|---------------------------------------|----------|------|-----|------|
| Supply voltage                        | V+       | -0.3 | 6   | V    |
| Input/Output Voltage                  | SCL, SDA | -0.3 | 6   | V    |
| Operating temperature, T <sub>A</sub> |          | -40  | 125 | °C   |
| Storage temperature, T <sub>stg</sub> |          | -65  | 150 | °C   |

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

|                    |                         |  | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                    |                         | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±500  |      |

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

|                  |                                | MIN  | NOM | MAX | UNIT |
|------------------|--------------------------------|------|-----|-----|------|
| V <sub>DD</sub>  | Supply voltage                 | 1.4  |     | 5.5 | V    |
| V <sub>I/O</sub> | SCL, SDA                       | 1.08 |     | 5.5 | V    |
| I <sub>OL</sub>  | Output current                 | 0    |     | 2   | mA   |
| T <sub>A</sub>   | Operating free-air temperature | -40  |     | 125 | °C   |

### 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |  | TMP118           | Unit  |
|-------------------------------|--|------------------|-------|
|                               |  | YMS (PICOSTAR-4) |       |
|                               |  | 4 PINS           |       |
| R <sub>θJA</sub>              | Junction-to-ambient thermal resistance       | 218.7            | °C/W  |
| R <sub>θJC(top)</sub>         | Junction-to-case (top) thermal resistance    | 2.7              | °C/W  |
| R <sub>θJB</sub>              | Junction-to-board thermal resistance         | 68.3             | °C/W  |
| Ψ <sub>JT</sub>               | Junction-to-top characterization parameter   | 1.3              | °C/W  |
| Ψ <sub>JB</sub>               | Junction-to-board characterization parameter | 68.1             | °C/W  |
| M <sub>T</sub>                | Thermal mass                                 | 0.14             | mJ/°C |

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application note, [SPRA953](#).

### 6.5 Electrical Characteristics

Over free-air temperature range and  $V_{DD} = 1.4V$  to  $5.5V$  for  $T_A = -40^\circ C$  to  $125^\circ C$  (unless otherwise noted); Typical specifications are at  $T_A = 25^\circ C$  and  $V_{DD} = 1.8V$  (unless otherwise noted)

| $I_{DD\_SD}$                            | Shutdown current                                  | Serial bus idle   | $25^\circ C$  |                                | 0.08    | 0.25       | $\mu A$       |            |
|   |   |   | $0^\circ C$ to $55^\circ C$   |                                | 0.11    | 0.3        |               |            |
|   |   |   | $-40^\circ C$ to $125^\circ C$  |                                |         | 1.5        |               |            |
| $V_{POR}$                               | Power-on reset threshold voltage                  | Supply voltage rising   |   |                                | 1.07    |            | V             |            |

Over free-air temperature range and  $V_{DD} = 1.4V$  to  $5.5V$  for  $T_A = -40^{\circ}C$  to  $125^{\circ}C$  (unless otherwise noted); Typical specifications are at  $T_A = 25^{\circ}C$  and  $V_{DD} = 1.8V$  (unless otherwise noted)

| PARAMETER   |   | TEST CONDITIONS        | MIN | TYP | MAX | UNIT |
|-------------|---|------------------------|-----|-----|-----|------|
| $V_{BOR}$   | Brownout detect   | Supply voltage falling |     |     | 0.9 | V    |
| $t_{INIT}$  | Initialization time after power-on reset <sup>(6)</sup> |                        |     | 1   |     | ms   |
| $t_{RESET}$ | Reset Time <sup>(7)</sup>                               | General Call Reset     |     | 0.1 |     | ms   |

- (1) For  $V_{DD}$  above 3.6V, refer to the  $PSR_{DC}$  specification to calculate the accuracy shift as a result of the power supply variation
- (2) Repeatability is the ability to reproduce a reading when the measured temperature is applied consecutively, under the same conditions.
- (3) Hysteresis is defined as the ability to reproduce a temperature reading as the temperature varies from room → hot → room → cold → room. The temperatures used for this test are  $-40^{\circ}C$ ,  $25^{\circ}C$ , and  $125^{\circ}C$ .
- (4) Quiescent current between conversions
- (5) For best temperature measurement accuracy, it is recommended to avoid any serial bus traffic during active temperature conversion
- (6) From device power-on reset to start of temperature conversion
- (7) From General Call Reset command received to start of temperature conversion

## 6.6 Two-Wire Interface Timing

Over free-air temperature range and  $V_{DD} = 1.4V$  to  $5.5V$  for  $T_A = -40^{\circ}C$  to  $125^{\circ}C$  (unless otherwise noted)

## 7 Detailed Description

### 7.1 Overview

The TMP118 is a digital output temperature sensor designed for high-accuracy, space constrained applications that comes factory calibrated for accuracy. The device features a two-wire, SMBus and I<sup>2</sup>C compatible interface with two modes of operation: continuous conversion mode and one-shot conversion mode. The TMP118 also includes an alert status flag with individual high and low thresholds registers. The device is specified over an ambient air operating temperature range of –40 °C to 125 °C. [Figure 7-1](#) shows a block diagram of the device.

### 7.2 Functional Block Diagrams

**7-1. Internal Block Diagram**

## 7.3 Feature Description

### 7.3.1 Digital Temperature Output

The Temp\_Result registers use a 16-bit format. Temperature data is represented by a 16-bit 2's complement word with a Least Significant Bit (LSB) equal to 0.0078125°C. The fractional values are included in the temperature readings, which can be denoted using Q notation, a simple way to represent the length of the fractional portion of the value. 2's Compliment is employed to describe negative temperatures. C code can easily convert the 2's Compliment data when the data is typecast into the correct signed data type. For more details on using Q notation to decode digital temperature data, refer to [How to Read and Interpret Digital Temperature Sensor Output Data](#) (SBAA588).

Note following power-up or reset, the temperature register reads 0°C until the first conversion is complete. Also note the decoding scheme allows temperature measurement beyond the recommended operating temperature range of -40°C to 125°C, but the device performance is not guaranteed beyond this range.

(1) The resolution for the Temp ADC in Internal Temperature mode is 0.0078125°C/count.

### 7.3.2 Averaging

The device supports 4 different averaging modes to help suppress noise as well as reduce the impact from external temperature fluctuations. The AVG [3:2] bits in the Configuration register can be programmed to control the averaging behavior of the device:

- No Averaging [00b]: The device performs 1 single conversion per conversion period, and temperature result is stored immediately into the Temp\_Result register at the end of every conversion.

図 7-2. Conversion (1Hz Conversion Rate Example) With No Averaging

- Back-to-back Averaging [01b or 10b]: The device accumulates and stores a number of temperature conversion results and reports the average of all the stored results at the end of the process. If AVG [3:2] is set to 01b, 4 conversions are executed back-to-back in every conversion period and the average temperature result is stored into the Temp\_Result register after the 4 conversions are completed. If AVG [3:2] is set to 10b, 8 conversions are executed back-to-back in every conversion period and the average temperature result is stored into the Temp\_Result register after the 8 conversions are completed.

The Back-to-back Averaging feature is useful to reduce the impact from the device's internal noise sources, such as the device thermal noise and ADC quantization noise. 図 6-8 and 図 6-9 illustrates the improved noise performance of the device as a result of turning on the 8x regular averaging. Note Back-to-back Averaging increases the average current consumption of the device due to increased active conversion time in every conversion period.

図 7-3. Conversion (1Hz Conversion Rate Example) With 4x Back-to-back Averaging

- Moving 4x Averaging [11b]: If AVG [3:2] is set to 11b, the device performs 1 single conversion per conversion period, and the new temperature result is averaged together with the results from the 3 previous conversion period and stored into the Temp\_Result register. The moving averaging feature can be beneficial to filter out fluctuation of external temperature source by taking multiple samples and averaging out the result.

**图 7-4. Conversion (1Hz Conversion Period) With 4x Running Averaging**

Averaging can be used in both the continuous conversion mode and the one-shot mode.

### 7.3.3 Temperature Comparator and Hysteresis

The TMP118 has a temperature comparator feature that uses the **THigh\_Limit** register for high temperature comparator threshold and the **TLow\_limit** register for low temperature comparator threshold. The low temperature comparator threshold is used to program the comparator hysteresis. The comparator thresholds are programmed in the TMP118 in a 12-bit two's complement format and with a resolution of 62.5m°C. The **Alert\_Flag** bit in the **Configuration** register is asserted when the temperature result equals or exceeds the **THigh\_Limit** for a consecutive number of conversions as set by the **Fault** bits in the **Configuration** Register, which can be programmed to 1, 2, 4, or 6 consecutive conversions. The **Alert\_Flag** clears when the temperature result drops below the **TLow\_Limit** for the same consecutive number of conversions. The difference between the two limits acts as a hysteresis on the comparator output, and the fault counter prevents false alerts as a result of environmental temperature fluctuations. The **Alert\_Flag** can be programmed to active low or active high by configuring the **Polarity** bit in the **Configuration** Register.

As shown in **图 7-5**, the alert status becomes active when the temperature equals or exceeds the value in **THigh\_Limit** for **Fault** number of consecutive conversions. The alert status remains active until the temperature falls below the **TLow\_Limit** for the same number of consecutive conversions. The **Alert\_Flag** can also be cleared by issuing the General Call Reset command.

**图 7-5. Alert\_Flag Behavior**

### 7.3.4 Strain Tolerance

The TMP118 features internal strain tolerance that helps mitigate error resulting from strain developed in the PicoStar package from various common manufacturing areas, including but not limited to device solder, molding, under-fill, and board flex.

To demonstrate this capability, multiple TMP118 devices are soldered onto a rigid 62mil thick PCB, and tested under multiple compression and tensile flexing orientations, with pin 1 located both orthogonal and parallel to the applied microstrain examined during the test, measured through a strain gauge. The test is performed under room temperature condition (30°C)  $V_{DD}$  of 1.8V, and continuous conversion mode (1Hz conversion interval) with 8x averaging turned on. The resultant temp error under this strain is measured against a known reference, and are recorded at increasing flex levels of the PCB.  7-6 demonstrates device distribution under these microstrain conditions. Several non-strain tolerant devices were also subjected to the same test to demonstrate the difference.

 7-6. Temperature Error vs. Strain

### 7.3.5 NIST Traceability

The TMP118 offers 3 Unique ID registers to support NIST traceability. These unique IDs can be used to provide an audit trail to standards provided by the National Institute of Standards and Technology (NIST), a US Commerce Department agency.

Reading the Unique ID registers requires a specific procedure to retrieve the content from the memory. The procedure is as follows:

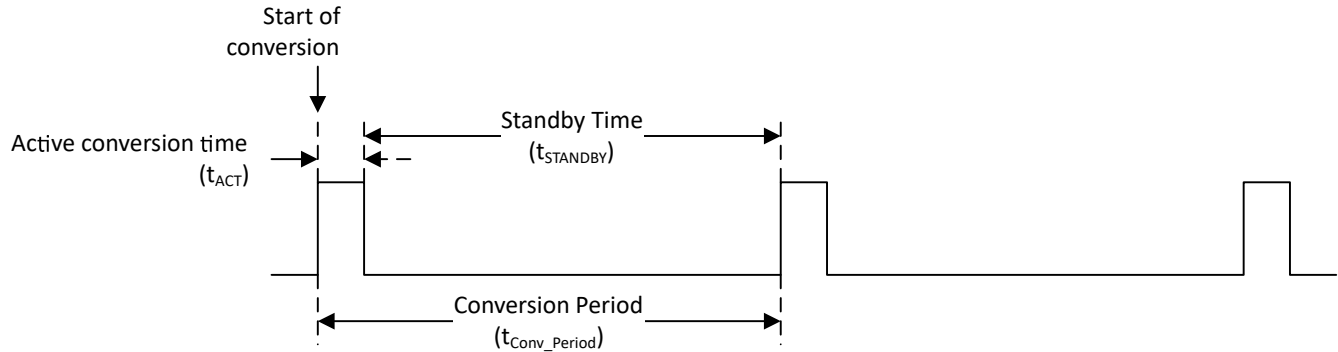

1. Place the device in Shutdown Mode by setting bit 8 of Register 01h to 1b.
2. Write 0x0000 to desired Unique ID pointer address (0Ch, 0Dh, or 0Eh).
3. Read Unique ID from the same pointer address.
4. Repeat step #2 above for each pointer address as desired.

## 7.4 Device Functional Modes

The TMP118 can be configured to operate in continuous or shutdown mode. This flexibility enables designers to balance the requirements of power efficiency and performance.

### 7.4.1 Continuous Conversion Mode

When the Shutdown bit is set to 0b in the configuration register, the device operates in continuous conversion mode. [Figure 7-7](#) shows the device in a continuous conversion cycle. In this mode, the device performs conversion at fixed intervals and updates the temperature result register at the end of every conversion. The typical active conversion time is 11ms (with no averaging).

**Figure 7-7. Continuous Conversion Cycle Timing Diagram**

The Conversion\_Rate[1:0] bits in the configuration register controls the rate at which the conversions are performed. The device typically consumes 55μA during conversion and 750nA during the low power standby period. By decreasing the rate at which conversions are performed, the application can benefit from reduced average current consumption in continuous mode.

Use [Equation 1](#) to calculate the average current in continuous mode.

$$\text{Average Current} = ((I_{DD\_ACTIVE} \times t_{ACT}) + (I_{DD\_SB} \times t_{STANDBY})) / t_{Conv\_Period} \quad (1)$$

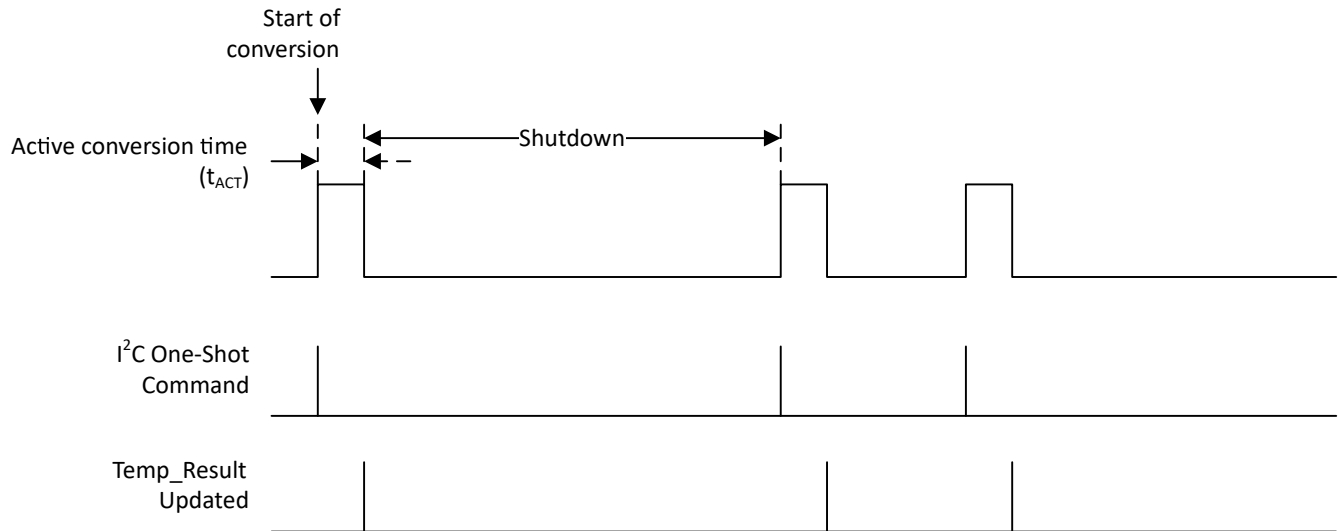

Where

- $t_{ACT}$  = Active conversion time
- $t_{Conv\_Period}$  = Conversion Period
- $t_{STANDBY}$  = Standby time between conversions calculated as  $t_{Conv\_Period} - t_{ACT}$

### 7.4.2 One-Shot Mode (OS)

The TMP118 features a one-shot temperature-measurement mode. When the device is in shutdown mode (bit Shutdown= 1b in the [Configuration Register](#)), writing 1b to both the OS and Shutdown bits in the [Configuration Register](#) begins a single temperature conversion, which typically takes 12ms. During the conversion, the OS bit reads 0b. The device returns to the shutdown state at the completion of the single conversion. After the conversion, the OS bit reads 1b. To trigger another one-short temperature conversion, write 1b to both the OS and Shutdown bits again in the [Configuration Register](#). This feature is useful for reducing power consumption in the device when continuous temperature monitoring is not required.

In Continuous Conversion Mode (bit Shutdown= 0b in the [Configuration Register](#)), the OS bit always reads 0b.

 **7-8. One-Shot Timing Diagram**

## 7.5 Programming

### 7.5.1 I<sup>2</sup>C and SMBus Interface

#### 7.5.1.1 Serial Interface

The TMP118 has a standard bidirectional I<sup>2</sup>C interface that is controlled by a controller device. Each target on the I<sup>2</sup>C bus has a specific device address to differentiate between other target devices that are on the same I<sup>2</sup>C bus. Many target devices require configuration upon start-up to set the behavior of the device. This is typically done when the controller accesses internal register maps of the target, which have unique register pointers. The TMP118 supports transmission data rates up to 1MHz.

##### 7.5.1.1.1 Bus Overview

The physical I<sup>2</sup>C interface consists of the serial clock (SCL) and serial data (SDA) lines. Both SDA and SCL lines must be connected to a supply through an external pullup resistor (unless integrated within the controller). The size of the pullup resistor is determined by the amount of capacitance on the I<sup>2</sup>C lines, the pullup bus voltage, and the communication frequency. For further details, see the [I<sup>2</sup>C Pullup Resistor Calculation](#) application note. Data transfer can be initiated only when the bus is idle. A bus is considered idle if both SDA and SCL lines are high after a STOP condition.

I<sup>2</sup>C communication with this device is initiated by the controller sending a START condition and terminated by the controller sending a STOP condition. A high-to-low transition on the SDA line while the SCL is high defines a START condition. A low-to-high transition on the SDA line while the SCL is high defines a STOP condition.

A repeated START condition is similar to a START condition and is used in place of a back-to-back STOP then START condition. A repeated START condition looks identical to a START condition, but differs from a START condition because the condition occurs without a STOP condition (when the bus is not idle).

図 7-9. Definition of Start and Stop Conditions

One data bit is transferred during each clock pulse of the SCL. One byte is comprised of eight bits on the SDA line. A byte can either be a device address, register pointer, or data written to or read from a target. Data is transferred Most Significant Bit (MSB) first. 2 bytes of data can be transferred from the controller to target between the START and STOP conditions. Data on the SDA line must remain stable during the high phase of the clock period, as changes in the data line when the SCL is high are interpreted as control commands (START or STOP).

☒ 7-10. One Byte of Data Transfer

#### 7.5.1.1.2 Device Address

To communicate with the TMP118, the controller must first address target devices through an address byte. The address byte has seven address bits and a read-write (R/W) bit that indicates the intent of executing a read or write operation. The TMP118 utilizes hardwired orderables for addressing to allow up to 4 target devices to be addressed on a single bus.

表 7-4. Device Address Options

| DEVICE            | 7-BIT I <sup>2</sup> C TARGET ADDRESS |           |
|-------------------|---------------------------------------|-----------|
|                   | HEX                                   | BINARY    |
| TMP118A/ TMP118MA | 0x48                                  | 1001000'b |
| TMP118B/ TMP118MB | 0x49                                  | 1001001'b |
| TMP118C/ TMP118MC | 0x4A                                  | 1001010'b |
| TMP118D/ TMP118MD | 0x4B                                  | 1001011'b |

#### 7.5.1.1.3 Writing and Reading Operation

##### 7.5.1.1.3.1 Writes

To write on the I<sup>2</sup>C bus, the controller sends a START condition on the bus with the address of the target, as well as the last bit (the R/W bit) set to 0b, which signifies a write. The target acknowledges, letting the controller know the target is present on the bus and ready. After this, the controller starts sending the register pointer and register data to the target until the controller has sent all the data necessary, and the controller terminates the transmission with a STOP condition.

Writes to read-only registers or register locations outside of the register map are ignored. The TMP118 still acknowledges (ACK) when writing outside of the register map. ☒ 7-11 shows an example of writing 2-byte data to a single register.

**7-11. Write to Single Register**

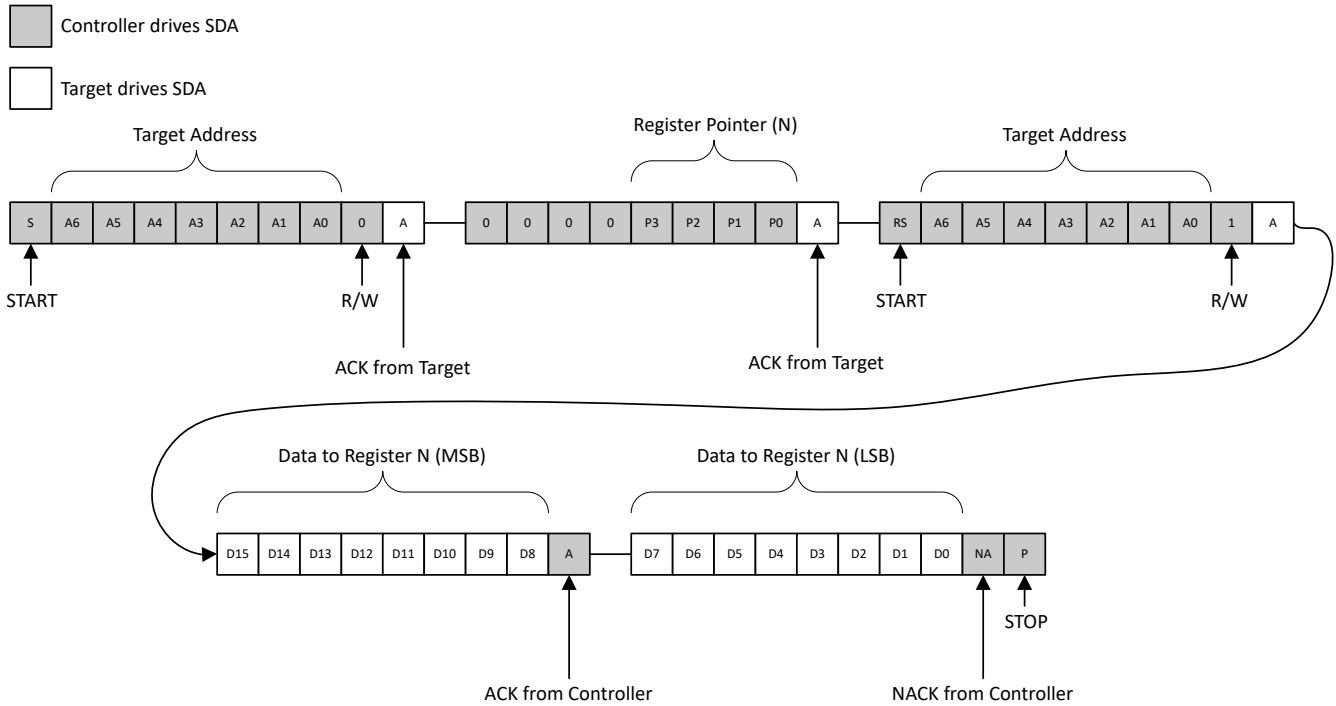

**7.5.1.1.3.2 Reads**

For a read operation the controller sends a START condition, followed by the target address with the R/W bit set to 0b (signifying a write). The target acknowledges the write request, and the controller then sends the register pointer in the next frame. The controller then initiates a START or RESTART followed by the target address with the R/W bit set to 1b (signifying a read). A START initiates communication with an target, while a RESTART allows the controller to access different registers on the same target without needing to send a full STOP signal first. The controller continues to send out clock pulses but releases the SDA line so that the target can transmit data. At the end of every byte of data, the controller sends an ACK to the target, letting the target know that the controller is ready for more data. Once the controller has received the number of bytes the controller is expecting, the controller sends a NACK, signaling to the target to halt communications and release the SDA line. The controller follows this up with a STOP condition.

Note that:

- If the controller needs to read from the same register repeatedly, the controller is not required to resend the pointer over and over again. The pointer value is stored in the device.
- The default pointer value upon device POR is 0h, so the controller can immediately proceed to read the temperature result after device power-up without sending the pointer value for the Temp\_Result register.
- Reading from a non-indexed register location returns 0x0h.

7-12 shows an example of reading a single word from a target register.

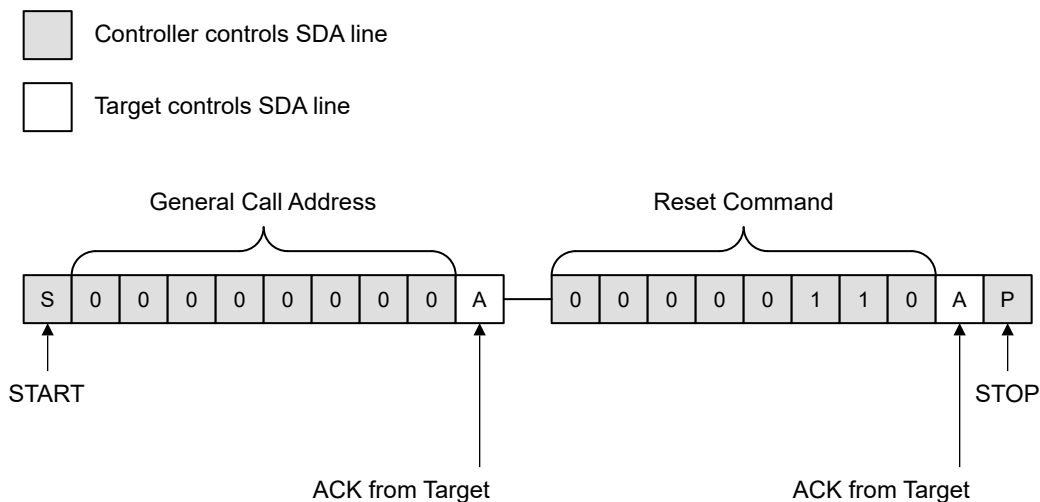

7-12. Read from Single Register

#### 7.5.1.1.4 General-Call Reset Function

A "General-Call Reset Function" in SMBus refers to a mechanism where a controller can send a signal to all target devices on the bus simultaneously, essentially initiating a reset operation on every connected device by broadcasting a special address known as the "General Call Address" instead of addressing to a specific target address. The feature allows for a coordinated reset across all devices on the bus, often used for system-wide initialization or error recovery scenarios.

The TMP118 responds to a two-wire, general-call address (0000000b) if the eighth bit is 0b. The device acknowledges the general-call address and responds to commands in the second byte. If the second byte is 0000011b or 06h, the TMP118 internal registers are reset to power-up values as shown in 7-13.

7-13. SMBus General Call Reset Diagram

#### 7.5.1.1.5 Timeout Function

The TMP118 resets the internal serial interface if the SCL line is held low by the controller or the SDA line is held low by the TMP118 for longer than 30ms (typical) between a START and STOP condition. The TMP118 releases the SDA line if the SCL pin is pulled low and waits for a START condition from the controller. To avoid activating the timeout function, maintain a communication speed of at least 1kHz for the SCL operating frequency.

#### 7.5.1.1.6 Coexistence on I3C Mixed Bus

A bus with both I3C and I<sup>2</sup>C interfaces is referred to as a mixed bus with clock speeds up to 12.5MHz. The TMP118 is an I<sup>2</sup>C device that can be on the same bus that has an I3C device attached as the device incorporates a spike suppression filter of 50ns on the SDA and SCL pins to filter out any communication above 4Mhz. The filter helps avoid any interference to the bus when I3C communication takes place on the bus. I<sup>2</sup>C bus targets (with 50ns filter) can coexist with I3C controllers operating at 12.5MHz, enabling the migration of existing I<sup>2</sup>C bus designs to the I3C specification.

## 8 Register Map

**表 8-1. TMP118 Register Map**

| POINTER              | TYPE | RESET | ACRONYM       | REGISTER NAME          | SECTION            |

## 9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The TMP118 is used to measure the temperature of the mounting location. The different address options allow up to four TMP118 sensors on a single serial bus. For more information, refer to the related [Considerations for Measuring Ambient Air Temperature](#) (SNOA966), [Replacing resistance temperature detectors with the TMP116 temp sensor](#) (SNOA969), and [Temperature sensors: PCB guidelines for surface mount devices](#) (SNOA967) application reports on ti.com.

### 9.2 Typical Application

#### 9.2.1 Separate I<sup>2</sup>C Pullup and Supply Application

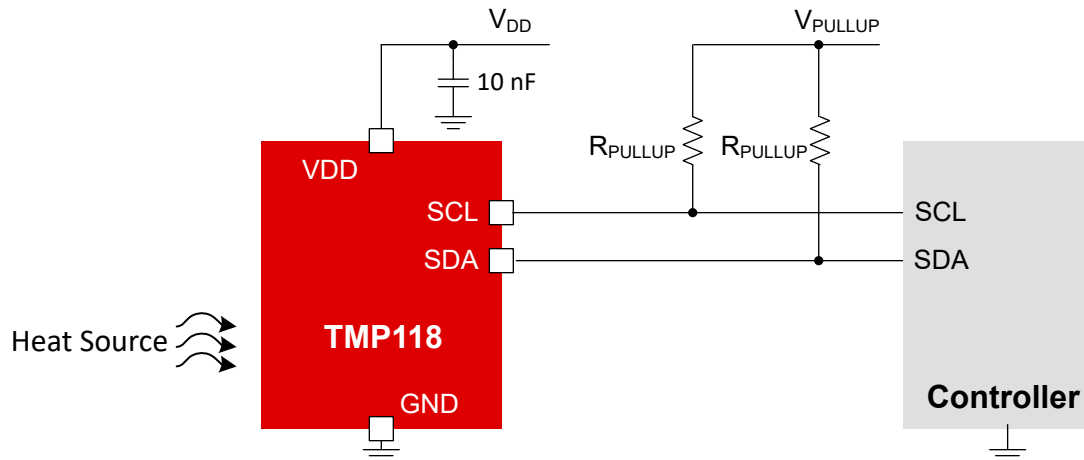

図 9-1. Separate I2C Pullup and Supply Voltage Application

#### 9.2.1.1 Design Requirements

For this design example, use the parameters listed below.

表 9-1. Design Parameters

| PARAMETER           | VALUE                     |
|---------------------|---------------------------|
| Supply ( $V_{DD}$ ) | 1.4V to 5.5V              |
| $V_{PULLUP}$        | 1.2V                      |
| $R_{PULLUP}$        | $V_{PULLUP} / 1\text{mA}$ |

### 9.2.1.2 Detailed Design Procedure

The TMP118 converts temperature at fixed intervals in continuous conversion mode. The SDA and SCL pin voltage of the TMP118 can be at a different voltage than the  $V_{DD}$  pin voltage, removing the need for power sequencing when using the TMP118. The I/O current is rated up to 2mA. The pullup resistors can be selected such that the I/O current is below the I/O current (1mA in this design example).

The TMP118 is a very small package with low thermal mass and can be placed as close to the temperature source as possible for better thermal coupling.

### 9.2.2 Equal I<sup>2</sup>C Pullup and Supply Voltage Application

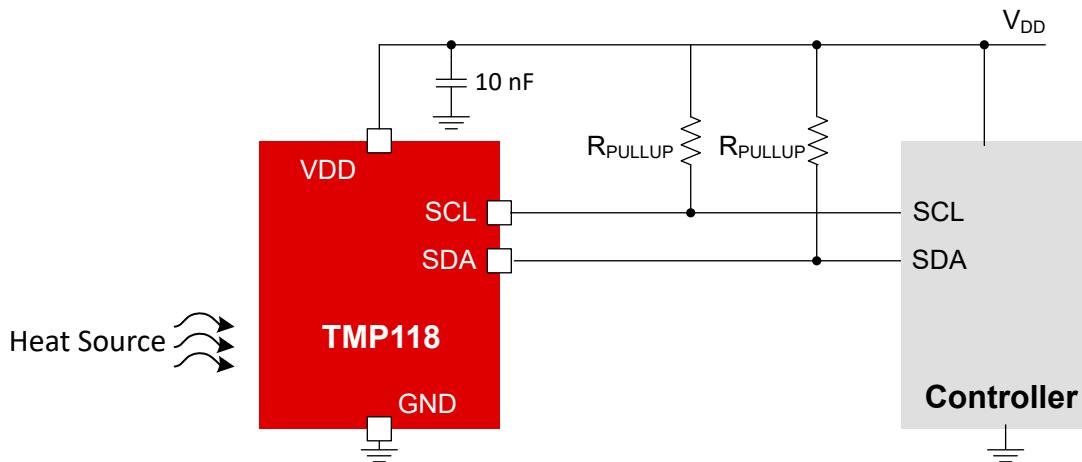

図 9-2. Equal I<sup>2</sup>C Pullup and Supply Voltage Application

#### 9.2.2.1 Design Requirements

For this design example, use the parameters listed below.

表 9-2. Design Parameters

| PARAMETER           | VALUE                 |
|---------------------|-----------------------|
| Supply ( $V_{DD}$ ) | 1.4V to 5.5V          |
| $V_{PULLUP}$        | $V_{DD}$              |
| $R_{PULLUP}$        | $V_{DD} / 1\text{mA}$ |

#### 9.2.2.2 Detailed Design Procedure

The SDA and SCL pin voltage of the TMP118 can be the same as the supply voltage  $V_{DD}$ . The accuracy of the device is not affected by the pullup voltage. The I/O current is rated up to 2mA. The pullup resistors must be selected such that the I/O current is below the I/O current (1mA in this design example).

## 9.3 Power Supply Recommendations

## 9.4 Layout

### 9.4.1 Layout Guidelines

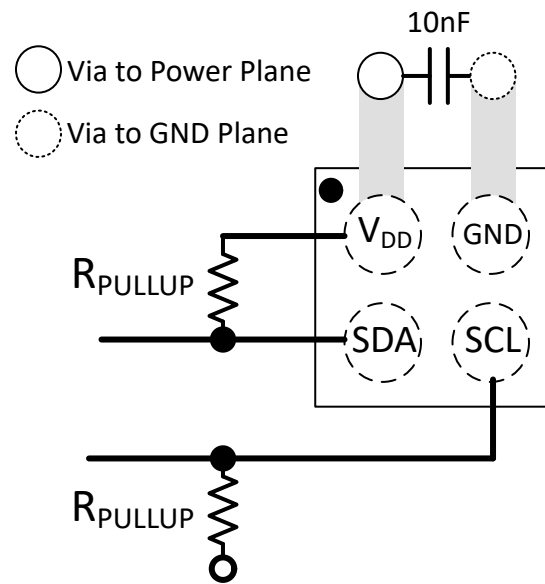

The TMP118 is a simple device to layout. Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 10nF. Pull up the open-drain output pin SDA and the I<sup>2</sup>C clock SCL through  $R_{PULLUP}$  pullup resistors. In some cases, the pullup resistor can be the heat source, therefore, maintain some distance between the resistor and the device. Avoid the direct light coming to the part as much as possible as the measurement accuracy and current consumption can be impacted under excessive light.

For more information on board layout, refer to the related [Precise temperature measurements with TMP116 and TMP117](#) (SNOA986) and [Wearable temperature-sensing layout considerations optimized for thermal response](#) (SNIA021) application notes on ti.com.

1. If the device is used to measure solid surface temperature:
  - Use PCB with minimal thickness.
  - Prevent PCB bending which can create a mechanical stress to package.
  - Cover bottom of the PCB with copper plane.
  - Remove bottom solder mask and cover exposed copper with gold layer if possible.
  - Use thermal conductive paste between PCB and object surface.
  - If PCB has unused internal layers, extend these layers under the sensor.
  - Minimize amount of copper wires on top of the board.
  - To minimize temperature “leakage” to surrounding air locate sensor in place with minimal air movement. Horizontal surfaces are preferable.
  - To minimize temperature offset due to “leakage” to surrounding air cover sensor with thermo isolating foam, tape or at least cover with a stain.
2. If the device is used to measure moving air temperature:
  - Because moving air temperature typically has a lot of fluctuations the PCB increased thermal mass reduces measurement noise.
  - Use a PCB with thicker copper layers if possible.
  - Cover both side of unused board space with copper layer.
  - Place PCB vertically along air flow.
3. If the device is used to measure still air temperature:
  - Miniaturize the board to reduce thermal mass. Smaller thermal mass results in faster thermal response.
  - Remove the top solder mask.
  - To prevent oxidation, cover any exposed copper with solder paste.
  - Thermal isolation is required to avoid thermal coupling from heat source components through the PCB.
  - Avoid running the copper plane underneath the temperature sensor.
  - Maximize the air gap between the sensor and the surrounding copper areas (anti-etch), especially when close to the heat source.
  - Create a PCB cutout between sensor and other circuits.
  - If the heat source is top side, avoid running traces on top; instead, route all signals on the bottom side.
  - Place the board vertically to improve air flow and to reduce dust collection.

### 9.4.2 Layout Examples

9-3. YMS Layout Recommendation

## 10 Device and Documentation Support

### 10.1 Documentation Support

### 10.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、[www.tij.co.jp](http://www.tij.co.jp) のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

### 10.3 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

### 10.4 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

### 10.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

### 10.6 用語集

[テキサス・インスツルメンツ用語集](#) この用語集には、用語や略語の一覧および定義が記載されています。

## 11 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

| DATE          | REVISION | NOTES           |
|---------------|----------|-----------------|
| December 2024 | *        | Initial Release |

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

| Orderable Device | Status<br>(1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan<br>(2) | Lead finish/<br>Ball material<br>(6) | MSL Peak Temp<br>(3) | Op Temp (°C) | Device Marking<br>(4/5) | Samples                 |
|------------------|---------------|--------------|-----------------|------|-------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|-------------------------|
| TMP118MAIYMSR    | ACTIVE        | PICOSTAR     | YMS             | 4    | 12000       | RoHS & Green    | CUNIPD                               | Level-1-260C-UNLIM   | -15 to 75    | P                       | <a href="#">Samples</a> |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
