

TPS22965x-Q1 車載対応、5.5V、4A、オン抵抗 16mΩ のロード・スイッチ

1 特長

- 車載アプリケーション認定済み
 - AEC-Q100 認定済み
 - デバイス温度グレード 2: 40°C ~ +105°C (TPS22965-Q1, TPS22965N-Q1)
 - デバイス温度グレード 1: 40°C ~ +125°C (TPS22965W-Q1, TPS22965NW-Q1)
 - デバイス HBM ESD 分類レベル 3A
 - デバイス CDM ESD 分類レベル C6
- 機能安全対応
 - 機能安全システムの設計に役立つ資料を利用可能
- シングル・チャンネル・ロード・スイッチを内蔵
- 入力電圧範囲: 0.8V ~ 5.5V
- 非常に低いオン抵抗 (R_{ON})
 - $V_{IN} = 5V$ ($V_{BIAS} = 5V$) で $R_{ON} = 16m\Omega$
 - $V_{IN} = 3.6V$ ($V_{BIAS} = 5V$) で $R_{ON} = 16m\Omega$
 - $V_{IN} = 1.8V$ ($V_{BIAS} = 5V$) で $R_{ON} = 16m\Omega$
- 連続スイッチ電流: 最大 4A
- 低静止電流: 50 μ A
- 制御入力しきい値が低いため、1.2、1.8、2.5、3.3V ロジックを使用可能
- 立ち上がり時間を設定可能
- クイック出力放電 (QOD) (TPS22965-Q1 および TPS22965W-Q1 のみ)
- サーマル・パッド付き WSON 8 ピン・パッケージ

2 アプリケーション

- 自動車用エレクトロニクス
- インフォテインメント
- ADAS (先進運転支援システム)

3 概要

TPS22965x-Q1 は、ターンオンが制御された、小型で R_{ON} が非常に低いシングル・チャンネル負荷スイッチです。このデバイスには N チャンネル MOSFET が内蔵されており、0.8V ~ 5.5V の入力電圧範囲で動作し、最大 4A の連続電流を供給できます。突入電流が小さくなるように、VOUT の立ち上がり時間を設定できます。TPS22965-Q1 および TPS22965W-Q1 デバイスには、スイッチがオフになった時に出力を迅速に放電できるように 225 Ω のオンチップ負荷抵抗が内蔵されています。

TPS22965x-Q1 デバイスは、大きな消費電力に対応可能なサーマル・パッド付き、小型、省スペースの 2mm × 2mm、8 ピン WSON パッケージ (DSG0008A) で供給されます。TPS22965-Q1 および TPS22965N-Q1 デバイスは、-40°C ~ 105°C の自由気流温度範囲で動作が規定されています。さらに、TPS22965W-Q1 および TPS22965NW-Q1 デバイスは同じ WSON パッケージ (DSG0008B) でウェットابل・フランクを採用しており、-40°C ~ +125°C の自由気流温度範囲で動作が規定されています。

表 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	VIN	I	Switch input. Input bypass capacitor recommended for minimizing V _{IN} dip. Must be connected to Pin 1 and Pin 2. See the Application and Implementation section for more information
2			
3	ON	I	Active high switch control input. Do not leave floating
4	VBIAS	I	Bias voltage. Power supply to the device. Recommended voltage range for this pin is 2 V to 5.5 V. See the Application and Implementation section for more information
5	GND	—	Device ground
6	CT	O	Switch slew rate control. Can be left floating. See the Application and Implementation section for more information
7	VOUT	O	Switch output
8			
—	Thermal pad	—	Thermal pad (exposed center pad) to alleviate thermal stress. Tie to GND. See the Layout section for layout guidelines

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT ⁽²⁾
V _{IN}	Input voltage	-0.3	6	V
V _{OUT}	Output voltage	-0.3	6	V
V _{BIAS}	Bias voltage	-0.3	6	V
V _{ON}	On voltage	-0.3	6	V
I _{MAX}	Maximum continuous switch current		4	A
I _{PLS}	Maximum pulsed switch current, pulse < 300 μs, 2% duty cycle		6	A
T _J	Maximum junction temperature		150	°C
T _{STG}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground pin.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾ HBM classification level 3A	V
		Charged device model (CDM), per AEC Q100-011 CDM classification level C6	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

- (1) See the [Application and Implementation](#) section.
- (2) In applications where high power dissipation, poor package thermal resistance is present, the maximum ambient temperature can be derated. Maximum ambient temperature [T_{A(max)}] is dependent on the maximum operating junction temperature [T_{J(max)}], the maximum power dissipation of the device in the application [P_{D(max)}], and the junction-to-ambient thermal resistance of the part, package in the application (R_{θJA}), as given by the following equation: T_{A(max)} = T_{J(max)} - (R_{θJA} × P_{D(max)}).

9 Detailed Description

9.1 Overview

The TPS22965x-Q1 is a single-channel, 4-A load switch in an 8-pin WSON package. To reduce the voltage drop in high current rails, the device implements an ultra-low resistance N-channel MOSFET. The device has a programmable slew rate for applications that require specific rise time.

The device has very low leakage current during OFF state. This low leakage prevents downstream circuits from pulling high standby current from the supply. Integrated control logic, driver, power supply, and output discharge FET eliminates the need for any external components, which reduces solution size and BOM count.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Adjustable Rise Time

A capacitor to GND on the CT pin sets the slew rate. The voltage on the CT pin can be as high as 12 V. Therefore, the minimum voltage rating for the CT cap must be 25 V for optimal performance. The below equations shows an approximate formula for the relationship between CT and slew rate when V_{BIAS} is set to 5 V. This equation accounts for 10% to 90% measurement on V_{OUT} and does *not* apply for $CT = 0$ pF. Use the below equation to determine rise times for when $CT = 0$ pF.

$$SR = 0.38 \times CT + 34 \quad (1)$$

where

- SR = slew rate (in $\mu\text{s}/\text{V}$).
- CT = the capacitance value on the CT pin (in pF).
- The units for the constant 34 are $\mu\text{s}/\text{V}$. The units for the constant 0.38 are $\mu\text{s}/(\text{V} \times \text{pF})$.

Rise time can be calculated by multiplying the input voltage by the slew rate. 表 9-1 contains rise time values measured on a typical device. The rise times listed in 表 9-1 are only valid for the power-up sequence where V_{IN} and V_{BIAS} are already in steady state condition before the ON pin is asserted high.

9.3.2 Quick Output Discharge (TPS22965-Q1 and TPS22965W-Q1 Only)

The TPS22965-Q1 and TPS22965W-Q1 include a Quick Output Discharge (QOD) feature. When the switch is disabled, a discharge resistor is connected between V_{OUT} and GND. This resistor has a typical value of 225 Ω and prevents the output from floating while the switch is disabled.

9.3.3 Low Power Consumption During OFF State

The I_{SD} V_{IN} supply current is 0.01- μA typical at 1.8 V V_{IN} . Typically, the downstream loads must have a significantly higher off-state leakage current. The load switch allows system standby power consumption to be reduced.

10 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

10.1 Application Information

This section highlights some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com for further aid.

10.1.1 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the R_{ON} of the device and the load current. The R_{ON} of the device depends upon the V_{IN} and V_{BIAS} conditions of the device. Refer to the R_{ON} specification of the device in the *Electrical Characteristics— $V_{BIAS} = 2\text{ V to } 2.5\text{ V}$* table of this data sheet. After the R_{ON} of the device is determined based upon the V_{IN} and V_{BIAS} conditions, use the following equation to calculate the VIN to VOUT voltage drop.

$$\Delta V = I_{LOAD} \times R_{ON} \quad (2)$$

where

- ΔV = voltage drop from VIN to VOUT.
- I_{LOAD} = load current.
- R_{ON} = On-resistance of the device for a specific V_{IN} and V_{BIAS} combination.

An appropriate I_{LOAD} must be chosen such that the I_{MAX} specification of the device is not violated.

10.1.2 On and Off Control

The ON pin controls the state of the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic thresholds. The ON pin can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

10.1.3 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor or short circuit, a capacitor must be placed between VIN and GND. A 1- μF ceramic capacitor, C_{IN} , placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high current applications. When switching heavy loads, TI recommends to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

10.1.4 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, TI highly recommends a C_{IN} greater than C_L . A C_L greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This event can result in current flow through the body diode from V_{OUT} to V_{IN} . TI recommends a C_{IN} to C_L ratio of 10 to 1 for minimizing V_{IN} dip caused by inrush currents during startup; however, a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1) can cause slightly more V_{IN} dip upon turn-on due to inrush currents. This event can be mitigated by increasing the capacitance on the CT pin for a longer rise time (see the *Adjustable Rise Time* section).

10.1.5 VIN and VBIAS Voltage Range

For optimal R_{ON} performance, make sure $V_{IN} \leq V_{BIAS}$. The device is still functional if $V_{IN} > V_{BIAS}$ but it exhibits R_{ON} greater than what is listed in the *Electrical Characteristics— $V_{BIAS} = 2\text{ V to } 2.5\text{ V}$* table. See the following

figure for an example of a typical device. Notice the increasing R_{ON} as V_{IN} exceeds V_{BIAS} voltage. Be sure to never exceed the maximum voltage rating for V_{IN} and V_{BIAS} .

10.2 Typical Application

This application demonstrates how the TPS22965x-Q1 can be used to power downstream modules.

10.2.1 Design Requirements

Use the values listed in the following table as the design parameters.

表 10-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{IN}	3.3 V
V_{BIAS}	5 V
C_L	22 μF
Maximum acceptable inrush current	400 mA

10.2.2 Detailed Design Procedure

10.2.2.1 Inrush Current

When the switch is enabled, the output capacitors must be charged up from 0 V to the set value (3.3 V in this example). This charge arrives in the form of inrush current. Use the following equation to calculate inrush current.

$$\text{Inrush Current} = C \times dV/dt \tag{3}$$

where

- C = output capacitance
- dV = output voltage
- dt = rise time

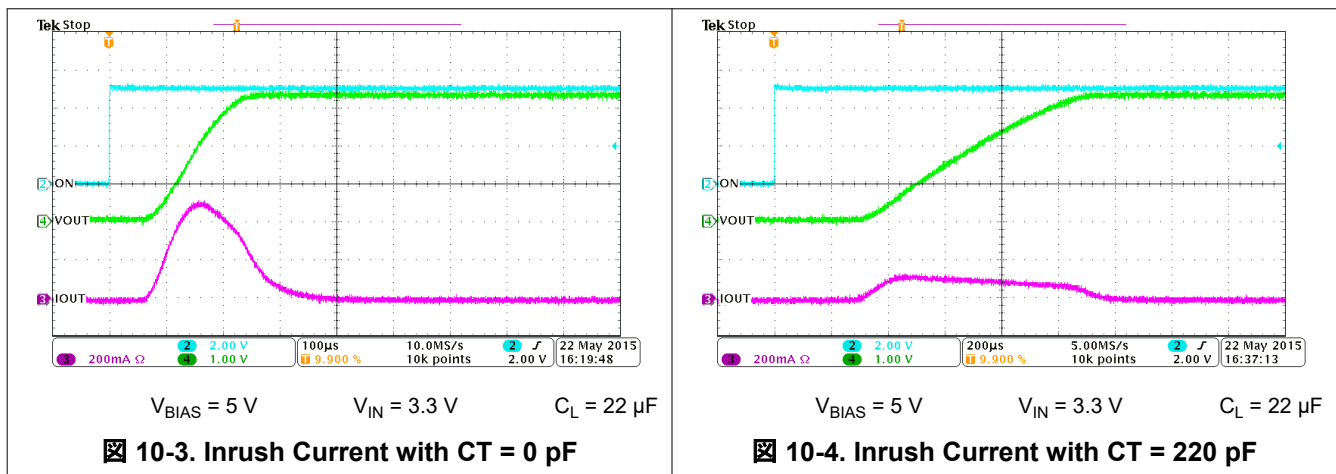

The TPS22965x-Q1 offers adjustable rise time for VOUT. This feature allows the user to control the inrush current during turn-on. The appropriate rise time can be calculated using the design requirements and the inrush current equation. See 式 4 and 式 5.

$$400 \text{ mA} = 22 \text{ }\mu\text{F} \times 3.3 \text{ V} / dt \tag{4}$$

$$dt = 181.5 \text{ }\mu\text{s} \tag{5}$$

To ensure an inrush current of less than 400 mA, choose a CT value that yields a rise time of more than 181.5 μs . See the oscilloscope captures in the [Application Curves](#) section for an example of how the CT capacitor can be used to reduce inrush current.

10.2.3 Application Curves

11 Power Supply Recommendations

The device is designed to operate from a VBIAS range of 2 V to 5.5 V and a VIN range of 0.8 V to VBIAS.

12 Layout

12.1 Layout Guidelines

For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances can have on normal operation. Using wide traces for VIN, VOUT, and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance. The CT trace must be as short as possible to avoid parasitic capacitance.

12.2 Layout Example

A. Thermal relief vias. Thermal relief vias connected to the exposed thermal pad.

12-1. Layout Recommendation

12.3 Thermal Consideration

The maximum IC junction temperature must be restricted to 150°C under normal operating conditions. Use the below equation as a guideline to calculate the maximum allowable dissipation, $P_{D(max)}$, for a given output current and ambient temperature.

$$P_{D(max)} = \frac{T_{J(max)} - T_A}{\theta_{JA}} \quad (6)$$

where

- $P_{D(max)}$ = maximum allowable power dissipation.
- $T_{J(max)}$ = maximum allowable junction temperature (150°C for the TPS22965x-Q1).
- T_A = ambient temperature of the device.
- θ_{JA} = junction to air thermal impedance. See the [Thermal Information](#) table. This parameter is highly dependent upon board layout.

Refer to [12-1](#). Notice the thermal vias located under the exposed thermal pad of the device. The thermal vias allow for thermal diffusion away from the device.

13.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
