

TPS254900A-Q1 車載用 USB ホスト充電器、 V_{BATT} への短絡保護機能搭載

1 特長

- 車載アプリケーション用に認定済み
- 下記内容で AEC-Q100 認定済み:
 - デバイス温度グレード 1: $-40^{\circ}\text{C} \sim +125^{\circ}\text{C}$ の動作時周囲温度範囲
 - デバイス HBM ESD 分類レベル H2
 - デバイス CDM ESD 分類レベル C5
- 入力電圧範囲: $4.5\text{V} \sim 6.5\text{V}$
- 3.5V (標準値) の UVLO により開始-停止をサポート
- $45\text{m}\Omega$ (標準値) のハイサイド MOSFET を内蔵
- 最大連続出力電流: 3.2A
- コネクタで $V_{BUS} \pm 5\%$ のケーブル補償精度
- USB BC 1.2 CDP および SDP モードをサポート
- OUT、DP_IN、DM_IN ピンのバッテリー短絡保護
- DP_IN と DM_IN は IEC 61000-4-2 規格に準拠
 - $\pm 8\text{kV}$ 接触および $\pm 15\text{kV}$ 空中放電
- $3\text{mm} \times 4\text{mm}$ の 20 ピン QFN パッケージ

2 アプリケーション

- 車載用 USB 充電ポート (ホストおよびハブ)
- 車載用 USB 保護

3 概要

TPS254900A-Q1 デバイスは USB 充電ポート・コントローラおよび電源スイッチで、バッテリーへの短絡保護機能が搭載されています。この機能により、OUT、DM_IN、DP_IN が保護されます。これら 3 つのピンは、最高で 18V の電圧に耐えられます。

バッテリーへの短絡状況が発生すると、内蔵の MOSFET が迅速にオフになります。この迅速なオフは、上流の DC/DC コンバータ、プロセッサ、ハブ・データ・ラインを保護するため非常に重要です。

TPS254900A-Q1 は UVLO が 3.5V と低いため、開始-停止時に電源スイッチがオフになりません。

TPS254900A-Q1 $45\text{m}\Omega$ 電源スイッチには 2 つの選択可能な可変の電流制限があり、隣接するポートに重い負荷が発生している場合に電流制限値を低く調整し、ポートの電力を管理できます。これは、複数のポートを持つシステムや、上流の電源の容量が限られている場合に重要です。

TPS254900A-Q1 デバイスには電流センシング出力があり、上流の電源を制御できます。これによって、充電電流が大きいときでも USB ポートを 5V に維持できます。この機能は、USB ケーブルが長く、高速充電を行う携帯機器によって大きな電圧低下が発生するようなシステムで重要です。

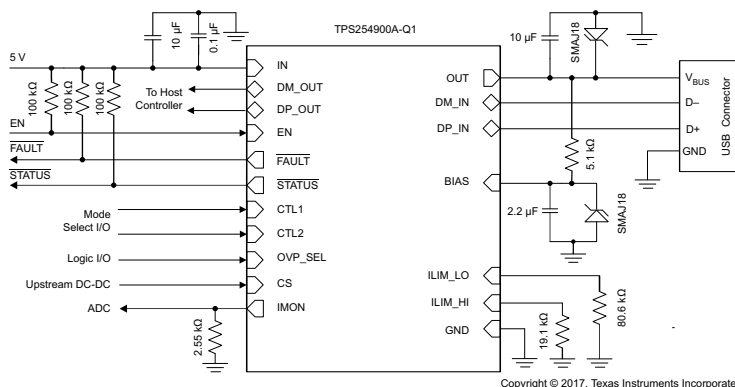

電流モニタにより、システムは IMON 電圧を監視して、負荷電流をリアルタイムで監視できます。この電流モニタは非常に便利で、動的なポート電力管理にも使用できます。

また、TPS254900A-Q1 デバイスは DP_IN および DM_IN について、IEC 61000-4-2、レベル 4 準拠の ESD 保護機能を備えています。

5 Pin Configuration and Functions

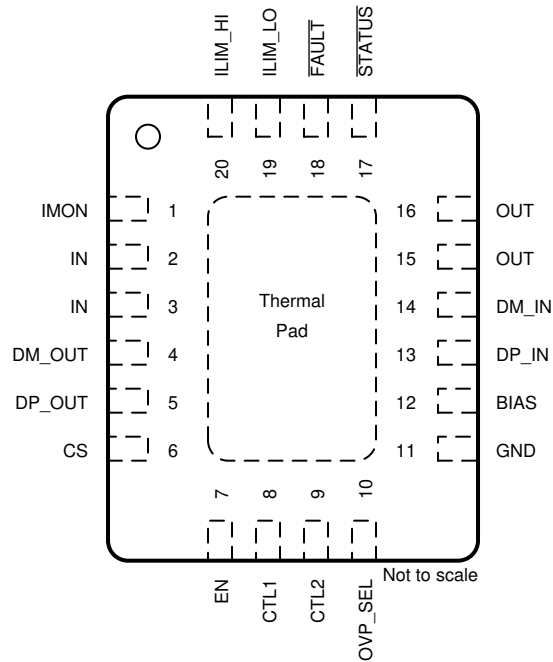

FIG 5-1. RVC Package 20-Pin WQFN Top View

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
BIAS	12	PWR	Used for IEC protection. Typically, connect a 2.2- μ F capacitor and a transient-voltage suppressor (TVS) to ground and 5.1 k Ω to OUT.
CS	6	O	Linear cable compensation current. Connect to divider resistor of front-end dc-dc converter.
CTL1	8	I	Logic-level control input for controlling the charging mode and the signal switches; see the Device Truth Table (TT) .
CTL2	9	I	Logic-level control input for controlling the charging mode and the signal switches; see the Device Truth Table (TT) .
DM_IN	14	I/O	D– data line to downstream connector
DM_OUT	4	I/O	D– data line to upstream USB host controller
DP_IN	13	I/O	D+ data line to downstream connector
DP_OUT	5	I/O	D+ data line to upstream USB host controller
EN	7	I	Logic-level control input for turning the power and signal switches on or off. When EN is low, the device is disabled, and the signal and power switches are OFF.
FAULT	18	O	Active-low, open-drain output, asserted during overtemperature, overcurrent, and overvoltage conditions.
GND	11	—	Ground connection; should be connected externally to the thermal pad.
ILIM_HI	20	I	External resistor used to set the high current-limit threshold.
ILIM_LO	19	I	External resistor used to set the low current-limit threshold and the load-detection current threshold.
IMON	1	O	This pin sources a scaled-down ratio of current through the internal FET. A resistor from this pin to GND converts current to proportional voltage; used as an analog current monitor.
IN	2,3	PWR	Input supply voltage; connect a 0.1- μ F or greater ceramic capacitor from IN to GND as close to the IC as possible.
OUT	15,16	PWR	Power-switch output

Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
OVP_SEL	10	I	Logic-level control input for choosing the OUT overvoltage threshold. When OVP_SEL is low, $V_{(OV_OUT_LOW)}$ is active. When OVP_SEL is high, $V_{(OV_OUT_HIGH)}$ is active.
STATUS	17	O	Active-low open-drain output, asserted in load-detect conditions
Thermal pad	—	—	Thermal pad on the bottom of the package

(1) I = Input, O = Output, I/O = Input and output, PWR = Power

6 Specifications

6.1 Absolute Maximum Ratings

Voltages are with respect to GND unless otherwise noted⁽¹⁾

		MIN	MAX	UNIT
Voltage range	CS, CTL1, CTL2, EN, FAULT, ILIM_HI, ILIM_LO, IN, IMON, OVP_SEL, STATUS	-0.3	7	V
	DM_OUT, DP_OUT	-0.3	5.7	
	BIAS, DM_IN, DP_IN, OUT	-0.3	18	
Continuous current	DM_IN to DM_OUT or DP_IN to DP_OUT	-100	100	mA
	OUT	Internally limited		
Continuous output source current, I_{SRC}	ILIM_HI, ILIM_LO, IMON	Internally limited		A
Continuous output sink current, I_{SNK}	FAULT, STATUS	25		mA
	CS	Internally limited		A
Operating junction temperature, T_J		-40	Internally limited	°C
Storage temperature, T_{stg}		-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT	
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000 ⁽²⁾	
		Charged-device model (CDM), per AEC Q100-011	±750 ⁽³⁾	
		IEC 61000-4-2 contact discharge	DP_IN and DM_IN pins ⁽⁴⁾	±8000
		IEC 61000-4-2 air discharge	DP_IN and DM_IN pins ⁽⁴⁾	±15000

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

(2) The passing level per AEC-Q100 Classification H2.

(3) The passing level per AEC-Q100 Classification C5

(4) Surges per IEC 61000-4-2, level 4, 1999 applied from DP_IN and DM_IN to output ground of the TPS254900Q1EVM-817 (SLUUB10) evaluation module.

6.3 Recommended Operating Conditions

Voltages are with respect to GND unless otherwise noted.

		MIN	NOM	MAX	UNIT
$V_{(IN)}$	Supply voltage	4.5		6.5	V
	Input voltage	CTL1, CTL2, EN, OVP_SEL	0	6.5	V
		DM_IN, DM_OUT, DP_IN, DP_OUT	0	3.6	V
$I_{(OUT)}$	Output continuous current	OUT ($-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$)		3.2 ⁽¹⁾	A
		DM_IN to DM_OUT or DP_IN to DP_OUT	-30	30	mA
	Continuous output sink current			10	mA

Voltages are with respect to GND unless otherwise noted.

		MIN	NOM	MAX	UNIT
$R_{(ILIM_xx)}$	Current-limit-set resistors	9.6		1000	k Ω
T_J	Operating junction temperature	-40		125	$^{\circ}\text{C}$

(1) Operating at output continuous current greater than 3.2A is possible, however lifetime will be degraded.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS254900A-Q1	UNIT
		RVC (WQFN)	
		20 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	37.9	$^{\circ}\text{C}/\text{W}$
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	39.9	$^{\circ}\text{C}/\text{W}$
$R_{\theta JB}$	Junction-to-board thermal resistance	11.9	$^{\circ}\text{C}/\text{W}$
Ψ_{JT}	Junction-to-top characterization parameter	0.5	$^{\circ}\text{C}/\text{W}$
Ψ_{JB}	Junction-to-board characterization parameter	11.8	$^{\circ}\text{C}/\text{W}$
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	3.2	$^{\circ}\text{C}/\text{W}$

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

Unless otherwise noted, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ and $4.5\text{ V} \leq V_{(IN)} \leq 6.5\text{ V}$, $V_{(EN)} = V_{(CTL1)} = V_{(CTL2)} = V_{(IN)}$, $R_{(FAULT)} = R_{(STATUS)} = 10\text{ k}\Omega$, $R_{(IMON)} = 2.55\text{ k}\Omega$, $R_{(ILIM_HI)} = 19.1\text{ k}\Omega$, $R_{(ILIM_LO)} = 80.6\text{ k}\Omega$. Positive currents are into pins. Typical values are at 25°C . All voltages are with respect to GND.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUT – POWER SWITCH					
$r_{DS(on)}$	On-resistance ⁽¹⁾	$T_J = 25^{\circ}\text{C}$	45	55	m Ω
		$-40^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$	45	69	
		$-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$	45	77	
I_{lkg}	Reverse leakage current	$V_{OUT} = 6.5\text{ V}$, $V_{IN} = V_{EN} = 0\text{ V}$, $-40^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$, measure $I_{(IN)}$		0.01	2 μA
OUT – DISCHARGE					
$R_{(DCHG)}$	Discharge resistance (mode change)	400	500	630	Ω
CTL1, CTL2, EN, OVP_SEL INPUTS					
	Input pin rising logic threshold voltage	0.8	1.35	2	V
	Input pin falling logic threshold voltage	0.7	1.15	1.65	V
	Hysteresis ⁽²⁾		200		mV
	Input current	Pin voltage = 0 V or 6.5 V		-1	1 μA
CURRENT LIMIT					

Unless otherwise noted, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ and $4.5\text{ V} \leq V_{(IN)} \leq 6.5\text{ V}$, $V_{(EN)} = V_{(CTL1)} = V_{(CTL2)} = V_{(IN)}$, $R_{(FAULT)} = R_{(STATUS)} = 10\text{ k}\Omega$, $R_{(IMON)} = 2.55\text{ k}\Omega$, $R_{(ILIM_HI)} = 19.1\text{ k}\Omega$, $R_{(ILIM_LO)} = 80.6\text{ k}\Omega$. Positive currents are into pins. Typical values are at 25°C . All voltages are with respect to GND.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{os}	OUT short-circuit current limit	R _(ILIM_LO) = 210 kΩ	190	240	290	mA
		R _(ILIM_LO) = 80.6 kΩ	555	620	680	
		R _(ILIM_LO) = 21.5 kΩ	2145	2300	2460

8 Detailed Description

8.1 Overview

The TPS254900A-Q1 device is a USB charging controller and power switch which integrates D+ and D– short-to-battery protection, cable compensation, current monitor (IMON), and IEC ESD protection suitable for automotive USB charging and USB port protection applications.

The integrated power distribution switch uses N-channel MOSFETs suitable for applications where short circuits or heavy capacitive loads will be encountered. The device allows the user to adjust the current-limit thresholds using external resistors. The device enters constant-current mode when the load exceeds the current-limit threshold.

The TPS254900A-Q1 device provides V_{BUS} , D+, and D– short-to-battery protection. This protects the upstream voltage regulator, automotive processor, and hub when these pins are exposed to fault conditions.

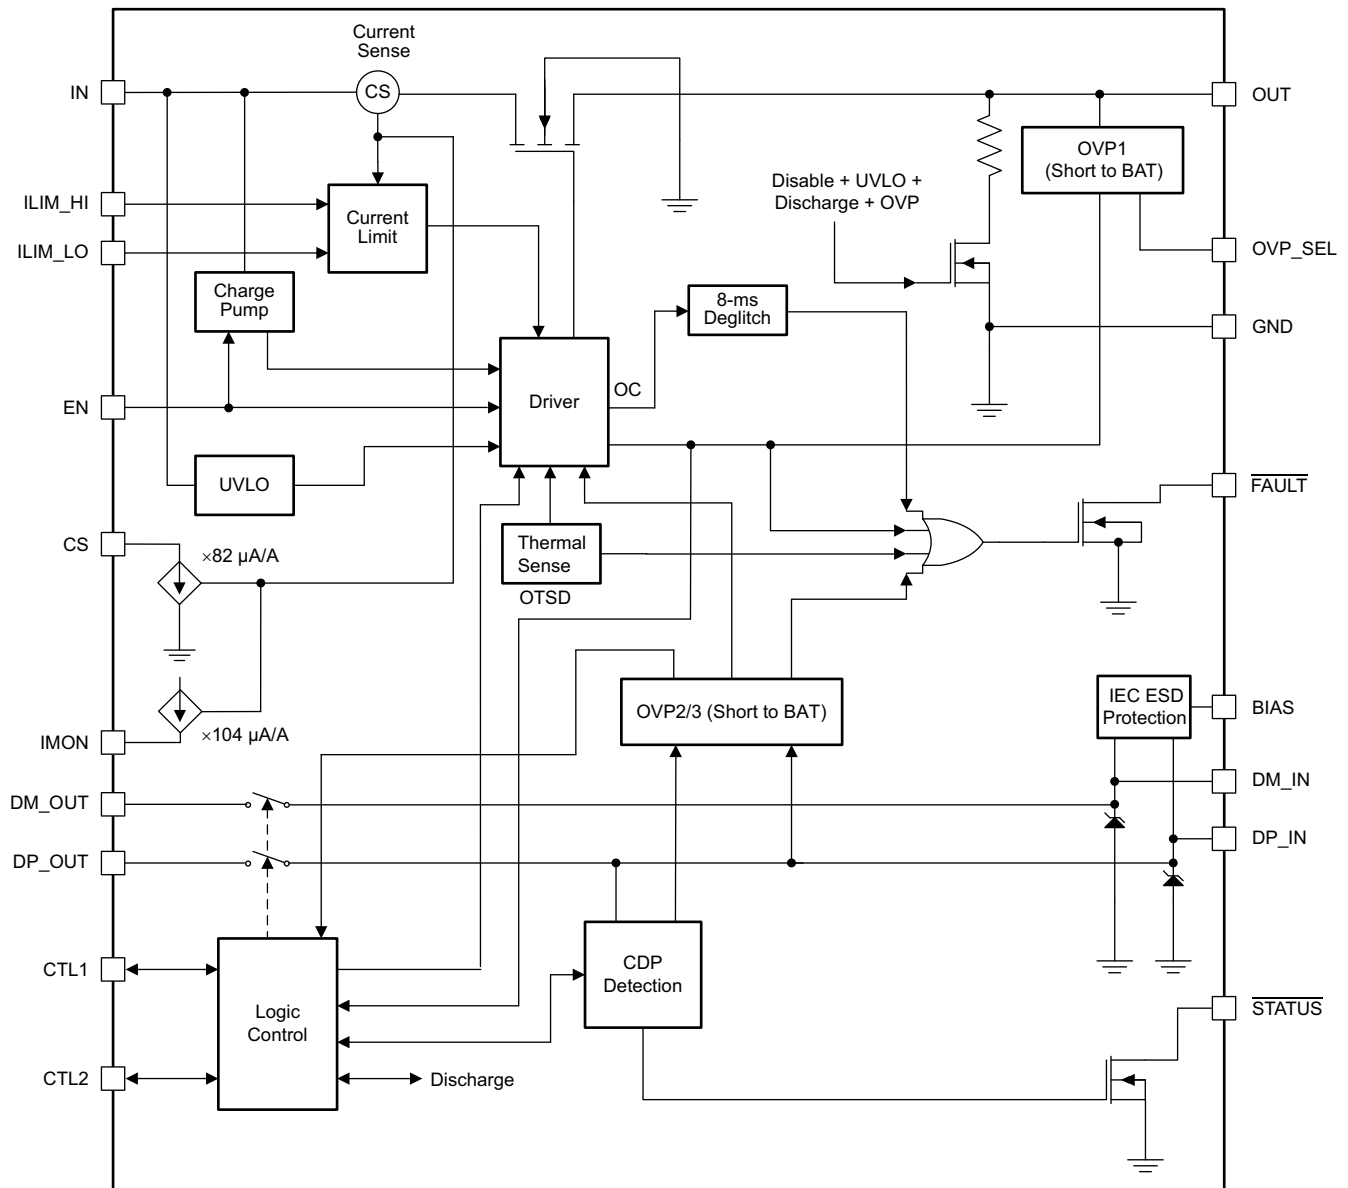

The device also integrates CDP mode, defined in the BC1.2 specification, to enable up to 1.5-A fast charging of most portable devices during data communication.

The TPS254900A-Q1 device integrates a cable compensation (CS) feature to compensate for long-cable voltage drop. This keeps the remote USB port output voltage constant to enhance the user experience under high-current charging conditions.

The TPS254900A-Q1 device provides a current-monitor function (IMON) by connecting a resistor from the IMON pin to GND to provide a positive voltage linearly with load current. This can be used for system power or dynamic power management.

Additionally, the device provides ESD protection up to ± 8 kV (contact discharge) and ± 15 kV (air discharge) per IEC 61000-4-2 on DP_IN and DM_IN.

8.3 Feature Description

8.3.1 FAULT Response

The device features an active-low, open-drain fault output. $\overline{\text{FAULT}}$ goes low when there is a fault condition. Fault detection includes overtemperature, overcurrent, or overvoltage on V_{BUS} , DP_IN and DM_IN . Connect a 10-k Ω pullup resistor from $\overline{\text{FAULT}}$ to IN.

表 8-1 summarizes the conditions that generate a fault and actions taken by the device.

表 8-1. Fault Conditions

EVENT	CONDITION	ACTION
Overvoltage on the data lines	$V_{(DP_IN)}$ or $V_{(DM_IN)} > 3.9\text{ V}$	The device immediately shuts off the USB data switches and the internal power switch. The fault indicator asserts with a 16-ms deglitch, and deasserts without deglitch.
Overvoltage on $V_{(OUT)}$	$V_{(OUT)} > 6\text{ V}$ or 6.95 V	The device immediately shuts off the internal power switch and the USB data switches. The fault indicator asserts with a 16-ms deglitch and deasserts without deglitch.
Overcurrent on $V_{(OUT)}$	$I_{(OUT)} > I_{(OS)}$	The device regulates switch current at $I_{(OS)}$ until thermal cycling occurs. The fault indicator asserts and deasserts with an 8-ms deglitch (the device does not assert FAULT on overcurrent in SDP1 mode).
Overtemperature	$T_J > OTSD2$ in non-current-limited or $T_J > OTSD1$ in current-limited mode.	The device immediately shuts off the internal power switch and the USB data switches. The fault indicator asserts immediately when the junction temperature exceeds OTSD2 or OTSD1 while in a current-limiting condition. The device has a thermal hysteresis of 20°C.

8.3.2 Cable Compensation

When a load draws current through a long or thin wire, there is an IR drop that reduces the voltage delivered to the load. In the vehicle from the voltage regulator 5-V output to the V_{PD_IN} (input voltage of portable device), the total resistance of power switch $r_{DS(on)}$ and cable resistance causes an IR drop at the PD input. So the charging current of most portable devices is less than their expected maximum charging current.

图 8-1. Voltage Drop

The TPS254900A-Q1 device detects the load current and applies a proportional sink current that can be used to adjust the output voltage of the upstream regulator to compensate for the IR drop in the charging path. The gain $G_{(CS)}$ of the sink current proportional to load current is 82 $\mu\text{A/A}$.

図 8-2. Cable Compensation Equivalent Circuit

8.3.2.1 Design Procedure

To start the procedure, the total resistance, including the power switch $r_{DS(on)}$ and wire resistance $R_{(WIRE)}$, must be known.

1. Choose $R_{(G)}$ following the voltage-regulator feedback resistor-divider design guideline.
2. Calculate $R_{(FA)}$ according to 式 1.

$$R_{FA} = (r_{DS(on)} + R_{(WIRE)}) / G_{(CS)} \quad (1)$$

3. Calculate $R_{(FB)}$ according to Equation 2.

$$R_{(FB)} = \frac{V_{(OUT)}}{V_{(FB)} / R_{(G)}} - R_{(G)} - R_{(FA)} \quad (2)$$

4. $C_{(COMP)}$ in parallel with $R_{(FA)}$ is required to stabilize $V_{(OUT)}$ when $C_{(BUS)}$ is large. Start with $C_{(COMP)} \geq 3 \times G_{(CS)} \times C_{(OUT)}$, then adjust $C_{(COMP)}$ to optimize the load transient of the voltage regulator output. $V_{(OUT)}$ stability should always be verified in the end application circuit.

8.3.3 D+ and D– Protection

D+ and D– protection consists of ESD and OVP (overvoltage protection). The DP_IN and DM_IN pins provide ESD protection up to ± 15 kV (air discharge) and ± 8 kV (contact discharge) per IEC 61000-4-2 (see the セクション 6.2 section for test conditions).

The ESD stress seen at DP_IN and DM_IN is impacted by many external factors, like the parasitic resistance and inductance between ESD test points and the DP_IN and DM_IN pins. For air discharge, the temperature and humidity of the environment can cause some difference, so the IEC performance should always be verified in the end-application circuit.

The IEC ESD performance of the TPS254900A-Q1 device depends on the capacitance connected from BIAS to GND. A 2.2- μ F capacitor placed close to the BIAS pin is recommended. Connect the BIAS pin to OUT using a 5.1-k Ω resistor as a discharge path for the ESD stress.

OVP protection is provided for short-to- V_{BUS} or short-to-battery conditions in the vehicle harness, preventing damage to the upstream USB transceiver or hub. When the voltage on DP_IN or DM_IN exceeds 3.9 V (typical), the TPS254900A-Q1 device quickly responds to block the high-voltage reverse connection to DP_OUT and DM_OUT. Overcurrent short-to-GND protection for D+ and D– is provided by the upstream USB transceiver.

8.3.4 V_{BUS} OVP Protection

The TPS254900A-Q1 OUT pin can withstand up to 18 V. The internal MOSFET turns off quickly when a short-to-battery condition occurs.

The TPS254900A-Q1 device has two OVP thresholds; one is 6 V (typical) and the other is 6.95 V (typical). Set the OVP threshold using the external OVP_SEL pin.

8.3.5 Output and D+ or D– Discharge

To allow a charging port to renegotiate current with a portable device, the TPS254900A-Q1 device uses the OUT discharge function. During mode change, the TPS254900A-Q1 device turns off the power switch while discharging OUT with a 500-Ω resistance, then turning back on the power switches to reassert the OUT voltage.

When an OVP condition occurs on DP_IN or DM_IN, the TPS254900A-Q1 device enables an internal 200-kΩ discharge resistance from DP_IN to ground and from DM_IN to ground. The analog switches are also turned off. The TPS254900A-Q1 device automatically disables the discharge paths and turns on the analog switches once the OVP condition is removed.

When an OVP condition occurs on OUT, the TPS254900A-Q1 device turns on an internal discharge path (see [表 8-2](#) for the discharge resistance). The TPS254900A-Q1 device automatically turns off the discharge path and turns on the power switch once the OVP condition is removed.

表 8-2. OUT Discharge Resistance

VIN ⁽¹⁾	EN ⁽¹⁾	OVP ⁽¹⁾	OUT DISCHARGE RESISTANCE ⁽²⁾
0	0	0	—
0	0	1	80 kΩ
0	1	0	—
0	1	1	80 kΩ
1	0	0	500 Ω
1	0	1	500 Ω or 55 kΩ
1	1	0	—
1	1	1	55 kΩ

(1) 0 = inactive, 1 = active

(2) — = no discharge resistance

8.3.6 Port Power Management (PPM)

PPM is the intelligent and dynamic allocation of power. PPM is for systems that have multiple charging ports but cannot power them all simultaneously.

8.3.6.1 Benefits of PPM

The benefits of PPM include the following:

- Delivers better user experience
- Prevents overloading of system power supply
- Allows for dynamic power limits based on system state
- Allows every port potentially to be a high-power charging port
- Allows for smaller power-supply capacity because loading is controlled

8.3.6.2 PPM Details

All ports are allowed to broadcast high-current charging. The current limit is based on ILIM_HI. The system monitors the $\overline{\text{STATUS}}$ pin to see when high-current loads are present. Once the allowed number of ports asserts $\overline{\text{STATUS}}$, the remaining ports are toggled to a non-charging port. The current limit of the non-charging port is based on the ILIM_LO setting. The non-charging ports are automatically toggled back to charging ports when a charging port deasserts $\overline{\text{STATUS}}$.

STATUS asserts in a charging port when the load current is above $ILIM_LO + 30\text{ mA}$ for 210 ms (typical). STATUS deasserts in a charging port when the load current is below $ILIM_LO - 20\text{ mA}$ for 3 seconds (typical).

8.3.6.3 Implementing PPM in a System With Two Charging Ports (CDP and SDP1)

Figure 8-3 shows the implementation of the two charging ports with data communication, each with a TPS254900A-Q1 device and configured in CDP mode. In this example, the 5-V power supply for the two charging ports is rated at less than 3.5 A. Both TPS254900A-Q1 devices have $R_{(ILIM)}$ chosen to correspond to the low (1-A) and high (2.4-A) current-limit setting for the port. In this implementation, the system can support only one of the two ports at 2.4-A charging current, whereas the other port is set to the SDP1 mode and I_{OS} corresponds to 1 A.

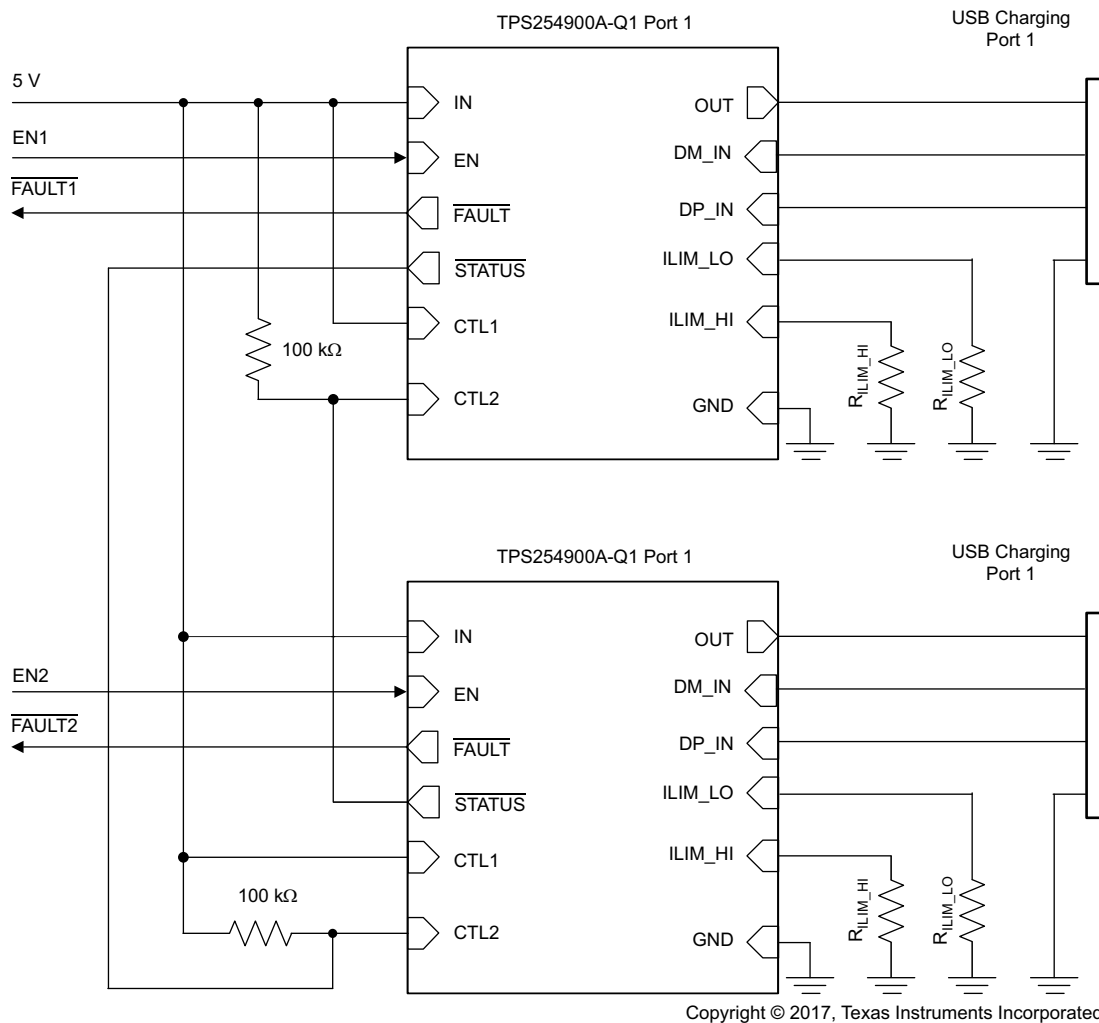

Figure 8-3. PPM Between CDP and SDP1

8.3.7 Overcurrent Protection

When an overcurrent condition is detected, the device maintains a constant output current and reduces the output voltage accordingly. Two possible overload conditions can occur. In the first condition, the output is shorted before the device is enabled or before the application of $V_{(IN)}$. The TPS254900A-Q1 device senses the short and immediately switches into a constant-current output. In the second condition, a short or an overload occurs while the device is enabled. At the instant the overload occurs, high currents flow for 1 to 2 μs (typical) before the current-limit circuit reacts. The device operates in constant-current mode after the current-limit circuit has responded. Complete shutdown occurs only if the fault is present long enough to activate thermal limiting. The device remains off until the junction temperature cools approximately 20°C and then restarts. The device continues to cycle on and off until the overcurrent condition is removed.

8.3.8 Undervoltage Lockout

The undervoltage-lockout (UVLO) circuit disables the power switch until the input voltage reaches the UVLO turnon threshold. Built-in hysteresis prevents unwanted oscillations on the output due to input voltage drop from large current surges.

8.3.9 Thermal Sensing

Two independent thermal-sensing circuits protect the TPS254900A-Q1 device if the temperature exceeds recommended operating conditions. These circuits monitor the operating temperature of the power-distribution switch and disable operation. The power dissipation in the package is proportional to the voltage drop across the power switch, so the junction temperature rises during an overcurrent condition. The first thermal sensor turns off the power switch when the die temperature exceeds 135°C and the device is in current limit. The second thermal sensor turns off the power switch when the die temperature exceeds 155°C regardless of whether the power switch is in current limit. Hysteresis is built into both thermal sensors, and the switch turns on after the device has cooled by approximately 20°C. The switch continues to cycle off and then on until the fault is removed. The open-drain false-reporting output, $\overline{\text{FAULT}}$, is asserted (low) during an overtemperature shutdown condition.

8.3.10 Current-Limit Setting

The TPS254900A-Q1 has two independent current-limit settings that are each adjusted externally with a resistor. The ILIM_HI setting is adjusted with $R_{(\text{ILIM_HI})}$ connected between ILIM_HI and GND. The ILIM_LO setting is adjusted with $R_{(\text{ILIM_LO})}$ connected between ILIM_LO and GND. Consult the device truth table (表 8-3) to see when each current limit is used. Both settings have the same relation between the current limit and the adjusting resistor.

The following equation calculates the value of resistor for adjusting the typical current limit:

$$I_{\text{OS(nom)}} \text{ (mA)} = \frac{48687 \text{ V}}{R_{(\text{ILIM_xx})}^{0.9945} \text{ k}\Omega} \quad (3)$$

Many applications require that the current limit meet specific tolerance limits. When designing to these tolerance limits, both the tolerance of the TPS254900A-Q1 current limit and the tolerance of the external adjusting resistor must be taken into account. The following equations approximate the TPS254900A-Q1 minimum and maximum current limits to within a few milliamperes and are appropriate for design purposes. The equations do not constitute part of TI's published device specifications for purposes of TI's product warranty. These equations assume an ideal—no variation—external adjusting resistor. To take resistor tolerance into account, first determine the minimum and maximum resistor values based on its tolerance specifications and use these values in the equations. Because of the inverse relation between the current limit and the adjusting resistor, use the maximum resistor value in the $I_{\text{OS(min)}}$ equation and the minimum resistor value in the $I_{\text{OS(max)}}$ equation.

$$I_{\text{OS(min)}} \text{ (mA)} = \frac{46464 \text{ V}}{R_{(\text{ILIM_xx})}^{0.9974} \text{ k}\Omega} - 32 \quad (4)$$

$$I_{\text{OS(max)}} \text{ (mA)} = \frac{51820 \text{ V}}{R_{(\text{ILIM_xx})}^{0.9987} \text{ k}\Omega} + 38 \quad (5)$$

The routing of the traces to the $R_{(ILIM_xx)}$ resistors should have a sufficiently low resistance so as not to affect the current-limit accuracy. The ground connection for the $R_{(ILIM_xx)}$ resistors is also very important. The resistors must reference back to the TPS254900A-Q1 GND pin. Follow normal board layout practices to ensure that current flow from other parts of the board does not impact the ground potential between the resistors and the TPS254900A-Q1 GND pin.

8.4 Device Functional Modes

8.4.1 Device Truth Table (TT)

The device truth table (表 8-3) lists all valid combinations for both control pins (CTL1 and CTL2), and the corresponding charging mode. The TPS254900A-Q1 device monitors the CTL inputs and transitions to the charging mode to which it is commanded.

表 8-3. Truth Table

CTL1	CTL2	CURRENT LIMIT SELECTED	MODE	STATUS FOR LOAD DETECT	CS FOR CABLE COMPENSATION	IMON FOR CURRENT MONITOR	FAULT REPORT	NOTES
0	0	N/A	Client mode ⁽¹⁾	OFF	OFF	OFF	OFF	Power switch is disabled, only analog switch is on.
0	1	ILIM_LO	SDP	OFF	ON	ON	ON	Standard SDP
1	0	ILIM_LO	SDP1 ⁽²⁾	OFF	ON	ON	ON ⁽³⁾	No OUT discharge between CDP and SDP1 for PPM
1	1	ILIM_HI	CDP ⁽²⁾	ON	ON	ON	ON	

(1) No 5.1-kΩ resistor from BIAS to OUT (open between the pins), or OUT still has 5-V voltage from an external downstream port; client mode is still active.

(2) No OUT discharge when changing from 10 to 11 or from 11 to 10.

(3) A fault only trips OTSD, OUT, DP_IN, DM_IN, and OVP.

8.4.2 USB BC1.2 Specification Overview

The BC1.2 specification includes three different port types:

- Standard downstream port (SDP)
- Charging downstream port (CDP)
- Dedicated charging port (DCP)

BC1.2 defines a charging port as a downstream-facing USB port that provides power for charging portable equipment. Under this definition, CDP and DCP are defined as charging ports.

表 8-4 lists the difference between these port types.

表 8-4. Operating Modes Table

PORT TYPE	SUPPORTS USB 2.0 COMMUNICATION	MAXIMUM ALLOWABLE CURRENT DRAWN BY PORTABLE EQUIPMENT (A)
SDP (USB 2.0)	YES	0.5
SDP (USB 3.0)	YES	0.9
CDP	YES	1.5
DCP	NO	1.5

8.4.3 Standard Downstream Port (SDP) Mode — USB 2.0 and USB 3.0

An SDP is a traditional USB port that follows the USB 2.0 or USB 3.0 protocol. An SDP supplies a minimum of 500 mA per port for USB 2.0 and 900 mA per port for USB 3.0. USB 2.0 and USB 3.0 communication is supported, and the host controller must be active to allow charging.

8.4.4 Charging Downstream Port (CDP) Mode

A CDP is a USB port that follows the USB BC1.2 specification and supplies a minimum of 1.5 A per port. A CDP provides power and meets the USB 2.0 requirements for device enumeration. USB 2.0 communication is supported, and the host controller must be active to allow charging. The difference between CDP and SDP is the host-charge handshaking logic that identifies this port as a CDP. A CDP is identifiable by a compliant BC1.2 client device and allows for additional current draw by the client device.

The CDP handshaking process occurs in two steps. During the first step, the portable equipment outputs a nominal 0.6-V output on the D+ line and reads the voltage input on the D– line. The portable device detects the connection to an SDP if the voltage is less than the nominal data-detect voltage of 0.3 V. The portable device detects the connection to a CDP if the D– voltage is greater than the nominal data-detect voltage of 0.3 V and optionally less than 0.8 V.

The second step is necessary for portable equipment to determine whether the equipment is connected to a CDP or a DCP. The portable device outputs a nominal 0.6-V output on the D– line and reads the voltage input on the D+ line. The portable device concludes the equipment is connected to a CDP if the data line being read remains less than the nominal data detects voltage of 0.3 V. The portable device concludes it is connected to a DCP if the data line being read is greater than the nominal data-detect voltage of 0.3 V.

The TPS254900A-Q1 device integrates CDP detection protocol, used at a downstream port as the CDP controller to support CDP portable-device fast charge up to 1.5 A.

8.4.5 Client Mode

The TPS254900A-Q1 device integrates client mode as shown in  8-6. The internal power switch is OFF to block current flow from OUT to IN, and the signal switches are ON. This mode can be used for software upgrades from the USB port.

Copyright © 2016, Texas Instruments Incorporated

图 8-6. Client-Mode Equivalent Circuit

Passing the IEC 61000-4-2 test for DP_IN and DM_IN requires connecting a discharge resistor to OUT during USB 2.0 high-speed enumeration. In client mode, because the power switch is OFF, OUT must be 5 V so that the device can work normally (usually powered by an external downstream USB port). If the OUT voltage is low, the communication may not work properly.

8.4.6 High-Bandwidth Data-Line Switch

The D+ and D– data lines pass through the device to enable monitoring and handshaking while supporting the charging operation. A wide-bandwidth signal switch allows data to pass through the device without corrupting signal integrity. The data-line switches are turned on in any of the CDP, SDP or client operating modes. The EN input must be at logic high for the data-line switches to be enabled.

注

- While in CDP mode, the data switches are ON, even during CDP handshaking.
- The data switches are only for the USB-2.0 differential pair. In the case of a USB-3.0 host, the super-speed differential pairs must be routed directly to the USB connector without passing through the TPS254900A-Q1 device.
- Data switches are OFF during OUT (V_{BUS}) discharge.

9 Application and Implementation

注

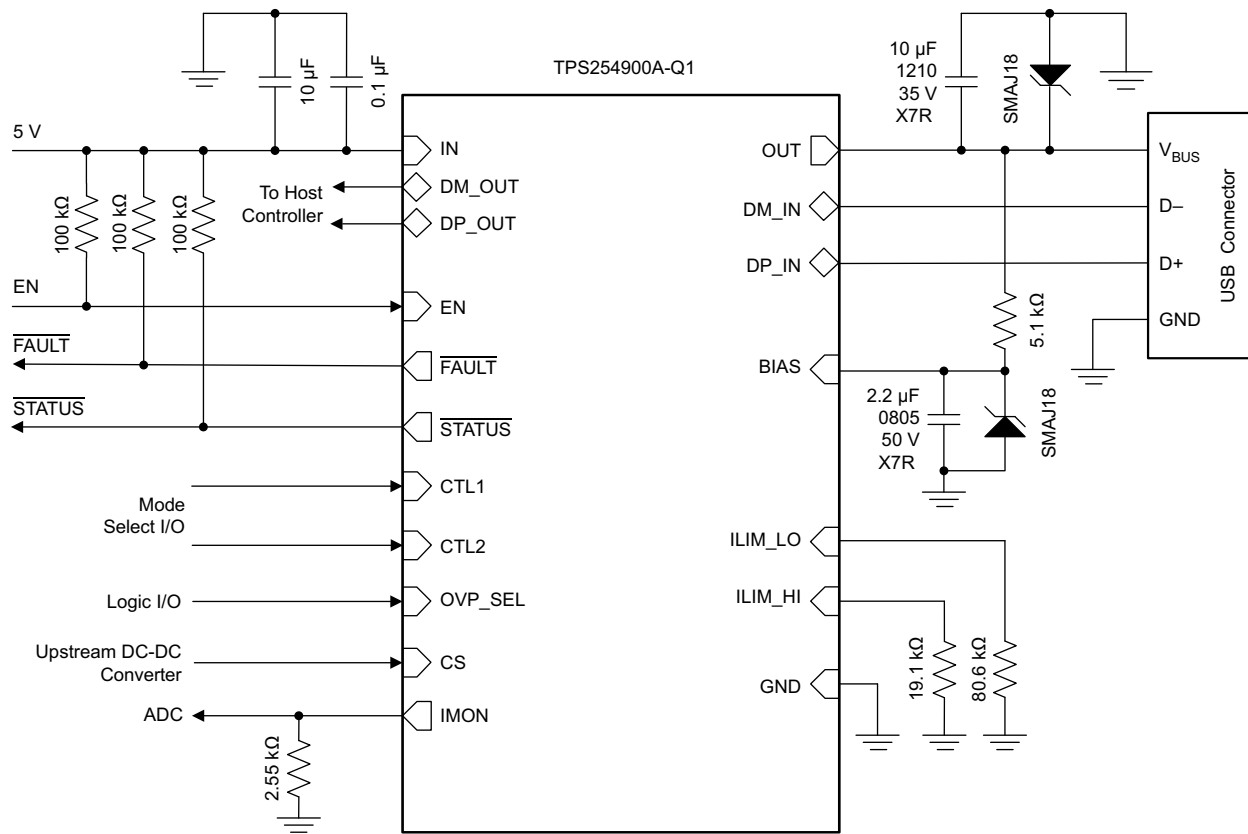

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS254900A-Q1 device is a USB charging-port controller and power switch with cable compensation and short-to-battery protection for V_{BUS} , D+, and D-. The device is typically used for automotive USB port protection and as a USB charging controller. The following design procedure can be used to select components for the TPS254900A-Q1 device. This section presents a simplified discussion of how to choose external components for V_{BUS} , D+, and D- short-to-battery protection. For cable-compensation design information, see the data sheet ([SLUSCE3](#)) for the TPS2549-Q1 device, which has features and design considerations very similar to those of the TPS254900A-Q1 device.

9.2 Typical Application

For an automotive USB charging port, the V_{BUS} , D+, and D- pins are exposed and require a protection device. The protection required includes V_{BUS} overcurrent, D+ and D- ESD protection, and short-to-battery protection. This charging-port device protects the upstream dc-dc converter (bus line) and automotive SOC or hub chips (D+ and D- data lines). An application schematic of this circuit with short-to-battery protection is shown in [Figure 9-1](#).

Copyright © 2017, Texas Instruments Incorporated

Figure 9-1. Typical Application Schematic: USB Port Charging With Cable Compensation

9.2.1 Design Requirements

For this design example, use the following as the input parameters.

DESIGN PARAMETER	EXAMPLE VALUE
Battery voltage, $V_{(BAT)}$	18 V
Short-circuit cable	0.5 m

9.2.2 Detailed Design Procedure

To begin the design process, the designer must know the following:

- The battery voltage
- The short-circuit cable length
- The maximum continuous output current for the charging port. The minimum current-limit setting of TPS254900A-Q1 device must be higher than this current.
- The maximum output current of the upstream dc-dc converter. The maximum current-limit setting of TPS254900A-Q1 device must be lower than this current.
- For cable compensation, the total resistance including power switch $r_{DS(on)}$, cable resistance, and connector contact resistance must be specified.

9.2.2.1 Input Capacitance

Consider the following application situations when choosing the input capacitors.

For all applications, TI recommends a 0.1- μ F or greater ceramic bypass capacitor between IN and GND, placed as close as possible to the device for local noise decoupling.

During output short or hot plug-in of a capacitive load, high current flows through the TPS254900A-Q1 device back to the upstream dc-dc converter until the TPS254900A-Q1 device responds (after $t_{(IOS)}$). During this response time, the TPS254900A-Q1 input capacitance and the dc-dc converter output capacitance source current to keep V_{IN} above the UVLO of the TPS254900A-Q1 device and any shared circuits. Size the input capacitance for the expected transient conditions and keep the path between the TPS254900A-Q1 device and the dc-dc converter short to help minimize voltage drops.

Input voltage overshoots can be caused by either of two effects. The first cause is an abrupt application of input voltage in conjunction with input power-bus inductance and input capacitance when the IN pin is in the high-impedance state (before turnon). Theoretically, the peak voltage is 2 times the applied voltage. The second cause is due to the abrupt reduction of output short-circuit current when the TPS254900A-Q1 device turns off and energy stored in the input inductance drives the input voltage high. Applications with large input inductance (for example, a connection between the evaluation board and the bench power supply through long cables) may require large input capacitance to prevent the voltage overshoot from exceeding the absolute-maximum voltage of the device.

During the short-to-battery (EN = HIGH) condition, the input voltage follows the output voltage until OVP protection is triggered ($t_{(OV_OUT)}$). After the TPS254900A-Q1 device responds and turns off the power switch, the stored energy in the input inductance can cause ringing.

Based on the three situations described, 10- μ F and 0.1- μ F low-ESR ceramic capacitors, placed close to the input, are recommended.

9.2.2.2 Output Capacitance

Consider the following application situations when choosing the output capacitors.

After an output short occurs, the TPS254900A-Q1 device abruptly reduces the OUT current, and the energy stored in the output power-bus inductance causes voltage undershoot and potentially reverse voltage as it discharges.

Applications with large output inductance (such as from a cable) benefit from the use of a high-value output capacitor to control the voltage undershoot.

For USB port applications, because the V_{BUS} pin is exposed to IEC61000-4-2 level-4 ESD, use a low-ESR capacitance to protect OUT.

The TPS254900A-Q1 device is capable of handling up to 18-V battery voltage. When V_{BUS} is shorted to the battery, the LCR tank circuit formed can induce ringing. The peak voltage seen on the OUT pin depends on the short-circuit cable length. The parasitic inductance and resistance varies with length, causing the damping factor and peak voltage to differ. Longer cables with larger resistance reduce the peak current and peak voltage. Consider high-voltage derating for the ceramic capacitor, because the peak voltage can be higher than twice the battery voltage.

Based on the three situations described, a 10- μ F, 35-V, X7R, 1210 low-ESR ceramic capacitor placed close to OUT is recommended. If the battery voltage is 16 V and a 16-V transient voltage suppressor (TVS) is used, then the capacitor voltage can be reduced to 25 V. Considering temperature variation, placing an additional 35-V aluminum electrolytic capacitor can lower the peak voltage and make the system more robust.

9.2.2.3 BIAS Capacitance

The capacitance on the BIAS pin helps the IEC ESD performance on the DM_IN and DP_IN pins.

When a short to battery on DP_IN, DM_IN and/or OUT occurs, high voltage can be seen on the BIAS pin. Place a 2.2- μ F, 50-V, X7R, 0805, low-ESR ceramic capacitor close to the BIAS pin. The whole current path from BIAS to GND should be as short as possible. Additionally, use a 5.1-k Ω discharge resistor from BIAS to OUT.

9.2.2.4 Output and BIAS TVS

The TPS254900A-Q1 device can withstand high transient voltages due to LCR tank ringing, but in order to make OUT, DP_IN, and DM_IN robust, place one TVS close to the OUT pin, and another TVS close to the BIAS pin. When choosing the TVS, the reverse standoff voltage V_R depends on the battery voltage (16 V or 18 V). Considering the peak pulse power capability, a 400-W device is recommended such as an SMAJ16 for a 16-V battery or an SMAJ18 for an 18-V battery.

9.2.3 Application Curves

图 9-2. Disabled, 25-V, 1206, X7R C_{OUT} Capacitor Without SMAJ18

图 9-3. Disabled, 35-V, 1210, X7R C_{OUT} Capacitor Without SMAJ18

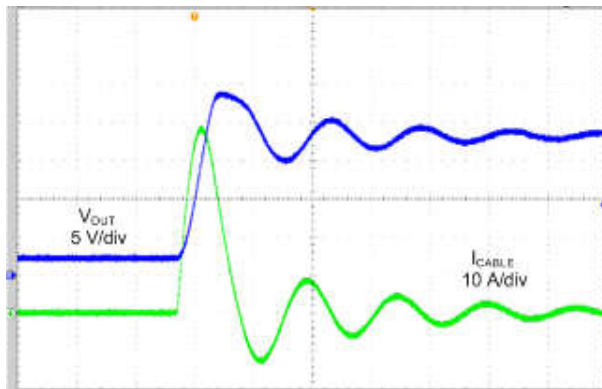

t = 10 μs/div

9-4. Disabled, 25-V, 1206, X7R C_{OUT} Capacitor With SMAJ18, OUT Shorted to Battery

t = 10 μs/div

9-5. Disabled, 35-V, 1210, X7R C_{OUT} Capacitor With SMAJ18, OUT Shorted to Battery

t = 10 μs/div

9-6. DC-DC Input Is Floating, OUT Shorted to Battery

t = 10 μs/div

9-7. Enabled With OVP_SEL = High, OUT Shorted to Battery

t = 10 μs/div

9-8. Enabled With OVP_SEL = Low, OUT Shorted to Battery

R_{BIAS} = 5.1 kΩ

t = 2 μs/div

9-9. Disabled, DP_IN Shorted to Battery

$R_{BIAS} = 5.1 \text{ k}\Omega$ $t = 2 \text{ }\mu\text{s/div}$

9-10. DC-DC Input Is Floating, DP_IN Shorted to Battery

$R_{BIAS} = 5.1 \text{ k}\Omega$ $t = 2 \text{ }\mu\text{s/div}$ $R_{(DP_OUT)} = 15 \text{ k}\Omega$

9-11. Enabled, DP_IN Shorted to Battery

10 Power Supply Recommendations

The TPS254900A-Q1 device is designed for a supply voltage range of $4.5 \text{ V} \leq V_{IN} \leq 6.5 \text{ V}$, with its power switch used for protecting the upstream power supply when a fault such as overcurrent or short to ground occurs on the USB port. Therefore, the power supply should be rated higher than the current-limit setting to avoid voltage drops during overcurrent or short-circuit conditions.

11 Layout

11.1 Layout Guidelines

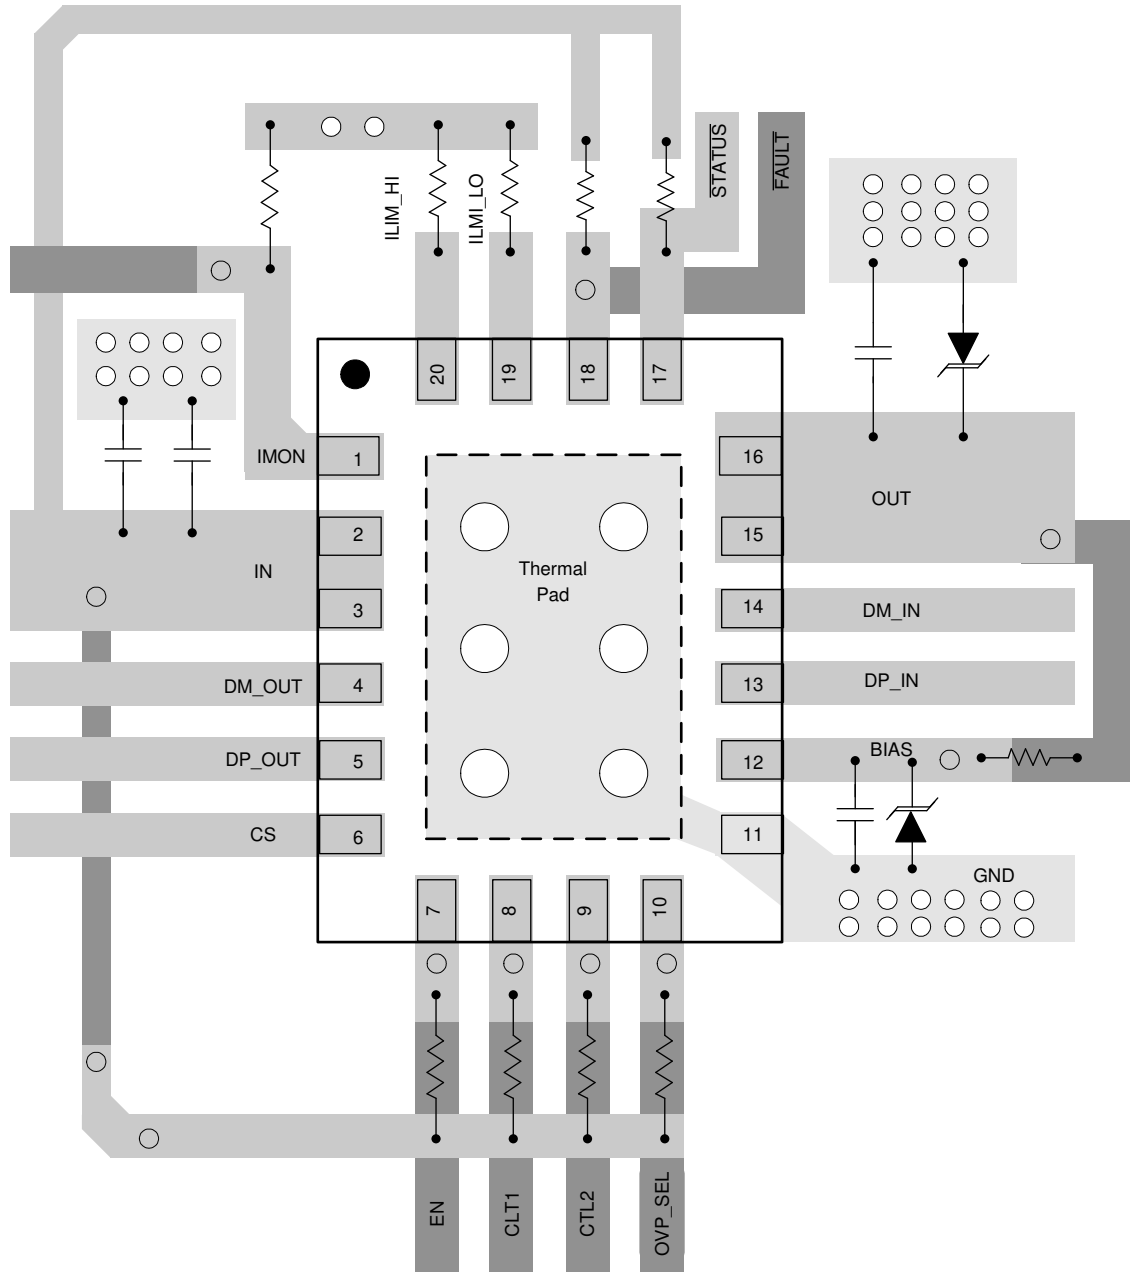

Layout best practices for the TPS254900A-Q1 device are listed as follows.

- Considerations for input and output power traces
 - Make the power traces as short as possible.
 - Make the power traces as wide as possible.
- Considerations for input-capacitor traces
 - For all applications, 10- μF and 0.1- μF low-ESR ceramic capacitors are recommended, placed close to the IN pin.
- The resistors attached to the ILIM_HI and ILIM_LO pins of the device have several requirements.
 - It is recommended to use 1% low-temperature-coefficient resistors.
 - The trace routing between these two pins and GND should be as short as possible to reduce parasitic effects on current limit. These traces should not have any coupling to switching signals on the board.
- Locate all TPS254900A-Q1 pullup resistors for open-drain outputs close to their connection pin. Pullup resistors should be 100 k Ω .
 - If a particular open-drain output is not used or needed in the system, tie it to GND.
- ESD considerations
 - The TPS254900A-Q1 device has built-in ESD protection for DP_IN and DM_IN. Keep trace lengths minimal from the USB connector to the DP_IN and DM_IN pins on the TPS254900A-Q1 device, and use minimal vias along the traces.
 - The capacitor on BIAS helps to improve the IEC ESD performance. A 2.2- μF capacitor should be placed close to BIAS, and the current path from BIAS to GND across this capacitor should be as short as possible. Do not use vias along the connection traces.
 - A 10- μF output capacitor should be placed close to the OUT pin and TVS.
 - See the *ESD Protection Layout Guide* (SLVA680) for additional information.
- TVS Considerations
 - For OUT, a TVS like SMAJ18 should be placed near the OUT pin.
 - For BIAS, a TVS like SMAJ18 should be placed close to the BIAS pin, but behind the 2.2- μF capacitor.
 - The whole path from OUT to GND or BIAS to GND across the TVS should be as short as possible.

- DP_IN, DM_IN, DP_OUT, and DM_OUT routing considerations
 - Route these traces as microstrips with nominal differential impedance of 90 Ω .
 - Minimize the use of vias on the high-speed data lines.
 - Keep the reference GND plane devoid from cuts or splits above the differential pairs to prevent impedance discontinuities.
 - For more USB 2.0 high-speed D+ and D– differential routing information, see the *High Speed USB Platform Design Guideline* from Intel.
- Thermal Considerations
 - When properly mounted, the thermal-pad package provides significantly greater cooling ability than an ordinary package. To operate at rated power, the thermal pad must be soldered to the board GND plane directly under the device. The thermal pad is at GND potential and can be connected using multiple vias to inner-layer GND. Other planes, such as the bottom side of the circuit board, can be used to increase heat sinking in higher-current applications. See the *PowerPad™ Thermally Enhanced Package* application report ([SLMA002](#)) and *PowerPAD™ Made Easy* application brief ([SLMA004](#)) for more information on using this thermal pad package.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated device. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS254900AIRVCRQ1	ACTIVE	WQFN	RVC	20	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	25490AQ	Samples
TPS254900AIRVCTQ1	ACTIVE	WQFN	RVC	20	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	25490AQ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
