

# TPS3813xxx ファミリ プロセッサ監視回路、ウィンドウ・ウォッチドッグ搭載

## 1 特長

- 遅延とウィンドウ比率をプログラム可能なウィンドウ ウォッチドッグ
- 6 ピン SOT-23 パッケージ
- 消費電流 9 $\mu$ A (標準値)
- 25ms の固定遅延時間を持つパワー オンリセットジェネレータ
- 高精度の電源電圧モニタ ( $V_{IT}$ ): 2.5V、3V、3.3V、5V
- オープンドレインリセット出力
- 温度範囲: -40°C~85°C

## 2 アプリケーション

- アクティブ・アンテナ・システム (AAS) の mMIMO
- ストレージ・エリア・ネットワーク
- 電気メーター
- 安全が重要なシステム
- 点滴用ポンプ
- HVAC コントローラ

### 代表的な動作回路

## 3 概要

TPS3813xxx ファミリの監視回路は、主に DSP およびプロセッサ ベースのシステムの回路の初期化とタイミングの監視を行います。

電源投入時に電源電圧 ( $V_{DD}$ ) が 1.1V を上回ると、 $\overline{\text{RESET}}$  がアサートされます。その後、監視回路は  $V_{DD}$  を監視し、 $V_{DD}$  がスレッシュホールド電圧 ( $V_{IT}$ ) よりも低く保たれている限り、 $\overline{\text{RESET}}$  をアクティブに維持します。内蔵のタイマは、システムを確実に正しくリセットさせるため、出力が非アクティブ状態 (HIGH) に戻るのを遅らせます。この遅延時間 ( $t_d = 25\text{ms}$  (標準値)) は、 $V_{DD}$  がスレッシュホールド電圧 ( $V_{IT}$ ) を上回ったときにカウントを開始します。電源電圧がスレッシュホールド電圧 ( $V_{IT}$ ) を下回ると、出力は再びアクティブ (Low) になります。外付け部品は不要です。このファミリの全デバイスには、内蔵分圧器で設定される固定検出スレッシュホールド電圧 ( $V_{IT}$ ) があります。

安全が要求されるアプリケーション向けに、TPS3813xxx ファミリには、いわゆるウィンドウ ウォッチドッグが組み込まれており、遅延とウィンドウ比率をプログラム可能です。ウォッチドッグのタイムアウトの上限は、WDT ピンを GND または  $V_{DD}$  に接続するか、外付けコンデンサを使用することで設定できます。下限、すなわちウィンドウ比率は、WDR ピンを GND または  $V_{DD}$  に接続することで設定されます。監視対象のプロセッサ は、このウィンドウ内で TPS3813xxx をトリガして、リセットがアサートされないようにする必要があります。

この製品スペクトラムは、2.5V、3V、3.3V、5V の電源電圧用に設計されています。これらの回路は 6 ピンの SOT-23 パッケージで供給されます。

TPS3813xxx デバイスは、-40°C~85°C の温度範囲で動作が規定されています。

## 5 Pin Configuration and Functions

**図 5-1. DBV Package  
6-Pin SOT-23  
Top View**

**表 5-1. Pin Functions**

PIN		I/O	DESCRIPTION
NO.	NAME		
1	WDI	I	Watchdog timer input. This input must be driven at all times and not left floating.
2	GND	I	Ground
3	WDT	I	Programmable watchdog delay input
4	V <sub>DD</sub>	I	Supply voltage and supervising input
5	WDR	I	Selectable watchdog window ratio input. This input must be tied to V <sub>DD</sub> or GND and not left floating.
6	RESET	O	Open-drain reset output

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted). <sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>DD</sub>	Supply voltage <sup>(2)</sup>		6.5	V
	RESET	−0.3	V <sub>DD</sub> + 0.3	V
	All other pins <sup>(2)</sup>	−0.3	6.5	V
I <sub>OL</sub>	Maximum low output current		5	mA
I <sub>OH</sub>	Maximum high output current		−5	mA
I <sub>IK</sub>	Input clamp current (V <sub>I</sub> < 0 or V <sub>I</sub> > V <sub>DD</sub> )		±20	mA
I <sub>OK</sub>	Output clamp current (V <sub>O</sub> < 0 or V <sub>O</sub> > V <sub>DD</sub> )		±20	mA
Continuous total power dissipation		See <a href="#">セクション 6.8</a>		
Soldering temperature			260	°C
T <sub>A</sub>	Operating free-air temperature	−40	85	°C
T <sub>stg</sub>	Storage temperature	−65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values are with respect to GND. For reliable operation, the device must not be operated at 7V for more than t = 1000h continuously.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750

- JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

At specified temperature range.

		MIN	MAX	UNIT
V <sub>DD</sub>	Supply voltage	2	6	V
V <sub>I</sub>	Input voltage	0	V <sub>DD</sub> + 0.3	V
V <sub>IH</sub>	High-level input voltage	0.7 × V <sub>DD</sub>		V
V <sub>IL</sub>	Low-level input voltage	0.3 × V <sub>DD</sub>		V
Δt/ΔV	Input transition rise and fall rate		100	ns/V
t <sub>w</sub>	Pulse width of WDI trigger pulse	50		ns
T <sub>A</sub>	Operating free-air temperature	−40	85	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS3813xxx	UNIT
		DBV (SOT-23)	
		6 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	208.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	123.3	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	37.2	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	14.6	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	36.3	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

Over recommended operating free-air temperature range (unless otherwise noted).

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT

6-6. Minimum Pulse Duration at V<sub>DD</sub> vs V<sub>DD</sub> Threshold Overdrive Voltage

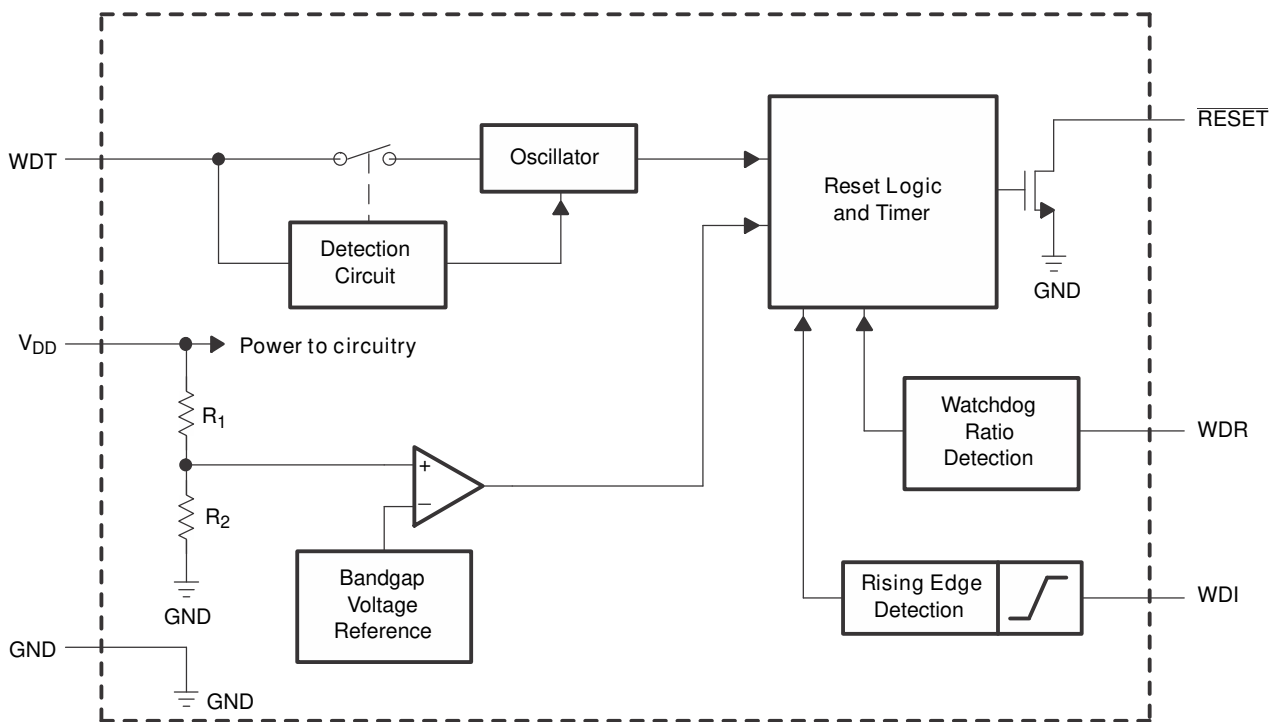

## 7 Detailed Description

### 7.1 Overview

The TPS3813xxx family of supervisory circuits provide circuit initialization and timing supervision signals. During power on,  $\overline{\text{RESET}}$  is asserted (low) when the supply voltage ( $V_{\text{DD}}$ ) increases above 1.1V. Thereafter, the supervisory circuit monitors  $V_{\text{DD}}$  and keeps  $\overline{\text{RESET}}$  low as long as  $V_{\text{DD}}$  remains below the threshold voltage ( $V_{\text{IT}}$ ). Once  $V_{\text{DD}}$  increases above  $V_{\text{IT}}$ , an internal timer delays the deassertion of the output to allow for a proper system reset before  $\overline{\text{RESET}}$  transitions to a high state. The delay time ( $t_d$ ) is 25ms typical and starts after  $V_{\text{DD}}$  rises above the  $V_{\text{IT}}$ . When the supply voltage drops below  $V_{\text{IT}}$ , the output transitions low again. All the devices of this family have a fixed threshold voltage set by an internal voltage divider.

The TPS3813xxx family incorporates a so-called window-watchdog timer, which has a programmable delay and window ratio. The supervised processor must trigger the WDI pin of the TPS3813xxx within the user-programmable window to keep  $\overline{\text{RESET}}$  from asserting. The upper limit of the watchdog time-out can be set by either connecting WDT to GND,  $V_{\text{DD}}$ , or using an external capacitor. The lower limit and thus the window ratio is set by connecting WDR to GND or  $V_{\text{DD}}$ .

### 7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 7.3 Feature Description

The TPS3813xxx family incorporates both a voltage supervisor and a window-watchdog timer into a single device. The device monitors the input voltage and the supervised processor must trigger the WDI pin of the TPS3813xxx within the user-programmable window to keep  $\overline{\text{RESET}}$  from asserting.

### 7.3.1 Input Voltage (VDD)

VDD pin is monitored by the internal comparator with integrated reference to indicate when VDD falls below the fixed threshold voltage. VDD also functions as the supply for the following:

- Internal bandgap (reference voltage)
- Internal regulator
- State machine
- Buffers
- Other control logic blocks

Good design practice involves placing a 0.1µF to 1µF bypass capacitor at VDD input for noisy applications and to make sure enough charge is available for the device to power up correctly. The reset output is undefined when VDD is below  $V_{POR}$ .

#### 7.3.1.1 VDD Hysteresis

The internal comparator has built-in hysteresis to avoid erroneous output reset release. If the voltage at the VDD pin falls below the falling voltage threshold  $V_{IT-}$ , the output reset is asserted. When the voltage at the VDD pin rises above the rising voltage threshold ( $V_{IT+} = V_{IT-} + V_{HYS}$ ), the output reset is deasserted after  $t_D$  reset time delay.

#### 7.3.1.2 VDD Glitch Immunity

These devices are immune to quick voltage transient or excursion on VDD. Sensitivity to transients depends on both pulse duration ( $t_{GL\_VIT}$ ) found in [セクション 6.6](#) and transient overdrive. Overdrive is defined by how much VDD exceeds the specified threshold. Threshold overdrive is calculated as a percent of the threshold in question, as shown in [式 1](#).

$$\text{Overdrive} = |((VDD / V_{IT-}) - 1) \times 100\%| \quad (1)$$

where

- $V_{IT-}$  is the threshold voltage
- $V_{IT+} = V_{IT-} + V_{HYS}$  is the rising threshold voltage
- VDD is the input voltage crossing  $V_{IT-}$

図 7-1. Overdrive Versus Pulse Duration

TPS3813xxx devices have built-in glitch immunity ( $t_{GL\_VIT}$ ) as shown in [セクション 6.6](#). [図 7-1](#) shows that VDD must fall below  $V_{IT-}$  for  $t_{GL\_VIT}$ , otherwise the falling transistion is ignored. When VDD falls below  $V_{IT-}$  for  $t_{GL\_VIT}$ , RESET transitions low to indicate a fault condition after the propagation delay high-to-low ( $t_{PHL}$ ). When VDD rises above  $V_{IT+} = V_{IT-} + V_{HYS}$ , RESET deasserts to a logic high indicating there is no more fault condition only if VDD remains above  $V_{IT+}$  for longer than the reset delay ( $t_D$ ).

### 7.3.2 User-Programmable Watchdog Timer (WDI)

The TPS3813xxx family of devices have a watchdog timer that must be periodically triggered by either a positive or negative transition at the WDI pin to avoid a reset signal being issued. When the supervising system fails to retrigger the watchdog circuit within the time-out interval,  $t_{t(out)}$ ,  $\overline{\text{RESET}}$  becomes asserted for the time period  $t_d$ . This event also reinitializes the watchdog timer. After the reset of the supervisor is released, the lower boundary of the first WDI window is disabled. After the first WDI low-to-high transition is detected, the lower boundary function of the window is enabled. All further WDI pulses must fit into the configured window frame.

Both the upper and lower boundary of the window can be adjusted by the user. See [セクション 7.5](#) for more details on how to set the upper and lower boundaries of the window.

### 7.3.3 $\overline{\text{RESET}}$ Output

$\overline{\text{RESET}}$  remains high (deasserted) as long as  $V_{DD}$  is above the threshold voltage ( $V_{IT}$ ) and the user-programmable watchdog timer criteria are met. If  $V_{DD}$  falls below the  $V_{IT}$  or if WDI is not triggered within the appropriate window, then  $\overline{\text{RESET}}$  is asserted, driving the  $\overline{\text{RESET}}$  pin to a low impedance.

When  $V_{DD}$  is once again above  $V_{IT}$ , a delay circuit is enabled that holds  $\overline{\text{RESET}}$  low for a specified reset delay period ( $t_d$ ) which is 25ms typical. When the reset delay has elapsed, the  $\overline{\text{RESET}}$  pin goes to a high-impedance state and uses a pullup resistor to hold  $\overline{\text{RESET}}$  high. Connect the pullup resistor to the proper voltage rail to enable the outputs to be connected to other devices at the correct interface voltage level.  $\overline{\text{RESET}}$  can be pulled up to any voltage up to 6V, independent of the device supply voltage. To ensure proper voltage levels, give some consideration when choosing the pullup resistor value and consider the required low-level output voltage ( $V_{OL}$ ), the output capacitive loading, and the output leakage current.

## 7.4 Device Functional Modes

[表 7-1](#) summarizes the various functional modes of the device.

**表 7-1. TPS3813xxx Function/Truth Table**

$V_{DD}$	WDI	$\overline{\text{RESET}}$
$V_{DD} < V_{POR}$	—	Undefined
$V_{POR} < V_{DD} < V_{IT}$	—	L
$V_{DD} > V_{IT}$	Outside window	L
$V_{DD} > V_{IT}$	Inside window	H

#### 7.4.1 Normal Operation ( $V_{DD} > V_{IT}$ )

When  $V_{DD}$  is greater than  $V_{IT}$ , the  $\overline{\text{RESET}}$  signal is determined by the last WDI pulse.

- WDI pulse inside window: as long as pulses occur within the user-programmable window, the  $\overline{\text{RESET}}$  signal remains high.
- WDI pulse outside window: if a pulse occurs outside the user-programmable window or not at all, the  $\overline{\text{RESET}}$  signal goes low.

#### 7.4.2 Above Power-On Reset But Less Than Threshold ( $V_{POR} < V_{DD} < V_{IT}$ )

When the voltage on  $V_{DD}$  is less than the  $V_{IT}$  voltage, and greater than the power-on reset voltage ( $V_{POR}$ ), the  $\overline{\text{RESET}}$  signal is asserted regardless of the WDI signal.

#### 7.4.3 Below Power-On Reset ( $V_{DD} < V_{POR}$ )

When the voltage on  $V_{DD}$  is lower than  $V_{POR}$ , the device does not have enough voltage to internally pull the asserted output low, and  $\overline{\text{RESET}}$  is undefined and must not be relied upon for proper device function.

## 7.5 Programming

### 7.5.1 Implementing Window-Watchdog Settings

There are two ways to configure the watchdog timer window the most flexible is to connect a capacitor to WDT to set the upper boundary of the window watchdog while connecting WDR to either  $V_{DD}$  or GND, thus setting the lower boundary. The other way to configure the timing is by wiring the WDT and WDR pin to either  $V_{DD}$  or GND. By hard-wiring the pins to either  $V_{DD}$  or GND there are four different timings available; these settings are listed in 表 7-2.

表 7-2. Cap-Free Timer Settings

SELECTED OPERATION MODE		WINDOW FRAME	LOWER WINDOW FRAME
WDT = 0V	WDR = 0V	Max = 0.3s	Max = 9.46ms
		Typ = 0.25s	Typ = 7.86ms
		Min = 0.2s	Min = 6.27ms
	WDR = $V_{DD}$	Max = 0.3s	Max = 2.43ms
		Typ = 0.25s	Typ = 2ms
		Min = 0.2s	Min = 1.58ms
WDT = $V_{DD}$	WDR = 0V	Max = 3s	Max = 93.8ms
		Typ = 2.5s	Typ = 78.2ms
		Min = 2s	Min = 62.5ms
	WDR = $V_{DD}$	Max = 3s	Max = 23.5ms
		Typ = 2.5s	Typ = 19.6ms
		Min = 2s	Min = 15.6ms

To visualize the values named in the table, a timing diagram was prepared. It is used to describe the upper and lower boundary settings. For an application, the important boundaries are the  $t_{\text{boundary,max}}$  and  $t_{\text{window,min}}$ . Within these values, the watchdog timer must be retriggered to avoid a time-out condition or a boundary violation in the event of a trigger pulse in the lower boundary. The values in the table above are typical and worst-case conditions and are valid over the whole temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

The shaded areas shown in 図 7-2 are cases where undefined operation can happen. This device can not detect a violation if a WDI pulse occurs within these three shaded areas. The first shaded area addresses the situation of two consecutive rising edges occur within a quick amount of time. The typical time between rising edges must be more than  $500\mu\text{s}$ . The second and third shaded areas are defined by the min and max variance of the lower boundary ( $t_{\text{boundary}}$ ) and upper boundary ( $t_{\text{window}}$ ). Set the WDI rising edge within the  $t_{\text{boundary,max}}$  and  $t_{\text{window,min}}$  for correct operation.

7-2. Upper and Lower Boundary Visualization

### 7.5.2 Programmable Window-Watchdog by Using an External Capacitor

The upper boundary of the watchdog timer can be set by an external capacitor connected between the WDT pin and GND. Common consumer electronic capacitors can be used to implement this feature. They must have low ESR, low leakage (< 5nA) and low tolerances because the tolerances have to be considered if the calculations are performed. The first formula is used to calculate the upper window frame. After calculating the upper window frame, the lower boundary can be calculated. As in the last example, the most important values are the  $t_{\text{boundary,max}}$  and  $t_{\text{window,min}}$ . The trigger pulse has to fit into this window frame.

The external capacitor must have a value between a minimum of 155pF and a maximum of 63nF.

表 7-3. Setting Upper Window Using External Capacitor

SELECTED OPERATION MODE		WINDOW FRAME
WDT = external capacitor $C_{\text{(ext)}}$	WDR = 0V and WDR = $V_{\text{DD}}$	$t_{\text{window,max}} = 1.25 \times t_{\text{window,typ}}$
		$t_{\text{window,min}} = 0.75 \times t_{\text{window,typ}}$

$$t_{\text{window,typ}} = \left( \frac{C_{\text{(ext)}}}{15.55 \text{ pF}} + 1 \right) \times 6.25 \text{ ms} \quad (2)$$

### 7.5.3 Lower Boundary Calculation

The lower boundary can be calculated based on the values given in [セクション 6.7](#). Additionally, facts must be considered to verify that the lower boundary is where it is expected. Because the internal oscillator of the window watchdog is running free, any rising edge at the WDI pin is considered at the next internal clock cycle. This happens regardless of the external source. Because the shift between internal and external clock is not known, it is best to consider the worst-case condition for calculating this value.

表 7-4. Setting Lower Boundary Using External Cap

SELECTED OPERATION MODE		LOWER BOUNDARY OF FRAME
WDT = external capacitor $C_{\text{(ext)}}$	WDR = 0V	$t_{\text{boundary,max}} = t_{\text{window,max}} / 23.5$
		$t_{\text{boundary,typ}} = t_{\text{window,typ}} / 25.8$
		$t_{\text{boundary,min}} = t_{\text{window,min}} / 28.7$
	WDR = $V_{\text{DD}}$	$t_{\text{boundary,max}} = t_{\text{window,max}} / 51.6$
		$t_{\text{boundary,typ}} = t_{\text{window,typ}} / 64.5$
		$t_{\text{boundary,min}} = t_{\text{window,min}} / 92.7$

### 7.5.4 Watchdog Software Considerations

To benefit from the window watchdog feature and help the watchdog timer monitor the software execution more closely, TI recommends that the watchdog be set and reset at different points in the program rather than pulsing the watchdog input periodically by using the prescaler of a microcontroller or DSP. Furthermore, the watchdog trigger pulses must be set to different timings inside the window frame to release a defined reset, if the program must hang in any subroutine. This allows the window watchdog to detect time-outs of the trigger pulse, as well as pulses that distort the lower boundary.

### 7.5.5 Power-Up Considerations

Many microcontrollers use general-purpose input and output (GPIO) pins that can be programmed to be either inputs or outputs. During power-up, these I/O pins are typically configured as inputs. If a GPIO pin is used to drive the WDI input pin of the TPS3813xxx, then a pulldown resistor (shown as R2 in [図 8-1](#)) must be added to keep the WDI pin from floating during power up.

## 8 Application and Implementation

### 注

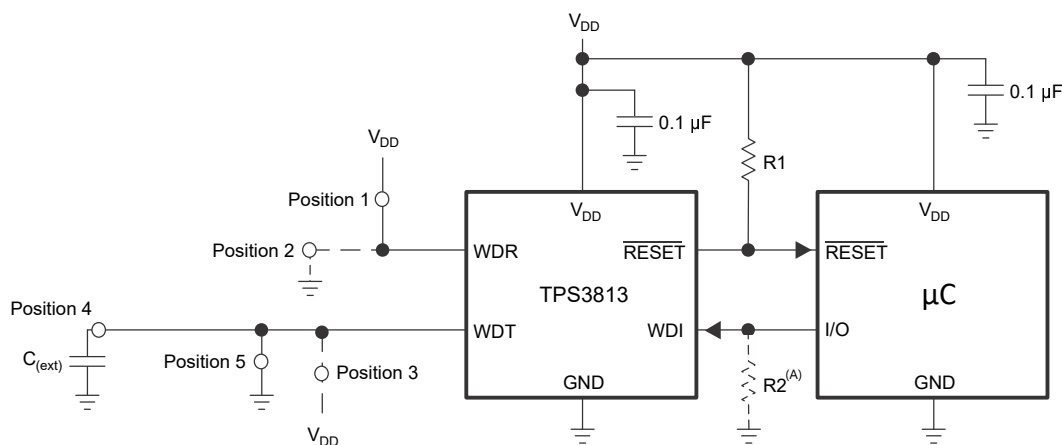

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 8.1 Application Information

The TPS3813xxx is a voltage supervisor that incorporates a window-watchdog timer, allowing for comprehensive supervision of microcontrollers and other similar devices. The TPS3813xxx can be operated from a VDD rail of 2V to 6V with a user-programmable watchdog time-out from 0.25s to 2.5s. The following sections describe how to properly use this device, depending on the requirements of the final application.

### 8.2 Typical Application

A typical application example (see [図 8-1](#)) is used to describe the function of the watchdog in more detail. To configure the window watchdog function, two pins are provided by the TPS3813xxx. These pins set the window time-out and ratio. The window watchdog ratio is a fixed ratio, which determines the lower boundary of the window frame. It can be configured in two different frame sizes.

Copyright © 2016, Texas Instruments Incorporated

- A. Use this pull-down resistor if a GPIO pin is used to drive the WDI input pin of the TPS3813xxx to keep the WDI pin from floating during power up.

**図 8-1. Application Example**

#### 8.2.1 Design Requirements

The TPS3813xxx  $\overline{\text{RESET}}$  output can be used to drive the  $\overline{\text{RESET}}$  pin of a microcontroller to initiate a reset event. The  $\overline{\text{RESET}}$  pin of the TPS3813xxx can be pulled high with a 1M $\Omega$  resistor; the watchdog window timing is controlled by the WDT and WDR pins, and is set depending on the reset requirement times of the microprocessor.

### 8.2.2 Detailed Design Procedure

If the window watchdog ratio pin (WDR) is set to  $V_{DD}$ , Position 1 in [Figure 8-1](#), then the lower window frame is a value based on a ratio calculation of the overall window time-out size: For the watchdog time-out pin (WDT) connected to GND, it is a ratio of 1:124.9, for WDT connected to  $V_{DD}$ , it is a ratio of 1:127.7, and for an external capacitor connected to WDT, it is a ratio of 1:64.5.

If the window watchdog ratio pin (WDR) is set to GND, Position 2, the lower window frame is a value based on a ratio calculation of the overall window time-out size: For the watchdog time-out pin (WDT) connected to GND, it is a ratio of 1:31.8, for WDT connected to  $V_{DD}$  it is 1:32, and for an external capacitor connected to WDT it is 1:25.8.

The watchdog time-out can be set in two fixed timings of 0.25 seconds and 2.5 seconds for the window or can be programmed by connecting an external capacitor with a low leakage current at WDT.

Example: If the watchdog time-out pin (WDT) is connected to  $V_{DD}$ , the time-out is 2.5 seconds. If the window watchdog ratio pin (WDR) is set in this configuration to a ratio of 1:127.7 by connecting the pin to  $V_{DD}$ , the lower boundary is 19.6ms.

### 8.2.3 Application Curve

**Figure 8-2. Minimum Pulse Duration at  $V_{DD}$  vs  $V_{DD}$  Threshold Overdrive Voltage**

### 8.3 Power Supply Recommendations

These devices are designed to operate from an input supply with a voltage range from 2V to 6V. An input supply capacitor is not required for this device; however, if the input supply is noisy, then good analog practice is to place a 0.1 $\mu$ F capacitor between the VDD pin and the GND pin. This device has a 7V absolute maximum rating on the VDD pin. If the voltage supply providing power to VDD is susceptible to any large voltage transient that can exceed 7V, additional precautions must be taken.

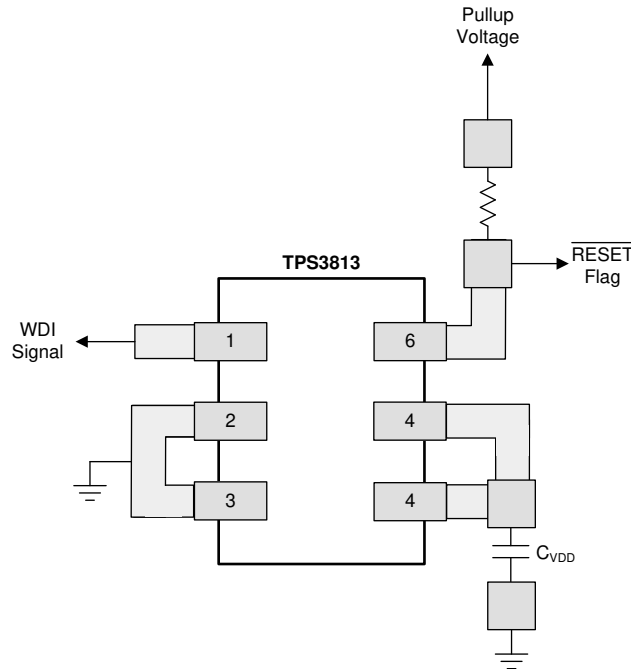

In applications where the WDI input can experience a negative voltage while  $V_{DD}$  is ramping from 0V to 0.8V, the  $V_{DD}$  slew rate in this range must be greater than 10V/s. A negative voltage on the WDI input along with a slew rate less than 10V/s can result in a greatly reduced watchdog window time and reset output delay time.

## 8.4 Layout

### 8.4.1 Layout Guidelines

Make sure that the connection to the VDD pin is low impedance. Good analog design practice is to place a 0.1µF ceramic bypass capacitor near the VDD pin.

### 8.4.2 Layout Example

## 10 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision I (October 2021) to Revision J (October 2023)	Page
• Changed absolute maximum voltage rating to 6.5V.....	4
• Changed ESD HBM rating to 2000V post qualification.....	4
• Changed ESD CDM rating to 750V post qualification.....	4
• Updated <a href="#">図 7-2</a> and description .....	11
• Updated external capacitor recommendation to have <b>low leakage , ESR and tolerances</b> .....	13

<b>Changes from Revision H (February 2016) to Revision I (October 2021)</b>	<b>Page</b>
• Changed $t_w$ parameter name to $t_{GI\_VIT}$ in 7.6 <i>Timing Requirements</i> section and added <i>Glitch immunity <math>V_{IT}</math></i> in parameter definition. ....	5
• Added Input Voltage (VDD), VDD Hysteresis, and VDD Glitch Immunity sections into datasheet.....	9

---

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
