

# TPS542A52 4V~18V 入力、15A、同期整流式降圧コンバータ、 差動リモート・センス付き

## 1 特長

- 9.1mΩ と 2.6mΩ の内蔵 MOSFET が最大 15A の出力電流をサポート
- 出力電圧範囲：0.5V~5.5V
- 選択可能な内部補償機能を備えた固定周波数電圧制御モード
- 400kHz~2.2MHz の 7 つの選択可能な周波数設定
- 外部クロックに同期
- 完全差動型リモート・センス
- 6 つの選択可能な過電流制限、4 つのソフトスタート・スルーレート
- プリバイアスされた出力への単調なスタートアップ
- EN ピンで入力 UVLO を調整可能
- パワー・グッド・インジケータ
- シャットダウン時の静止電流：17μA (標準値)
- 軽負荷時の効率向上のために FCCM または PFM を選択可能
- 動作時接合部温度：-40°C~+150°C
- 4mm × 4.5mm VQFN パッケージ
- **WEBENCH® Power Designer** により、TPS542A52 を使用するカスタム設計を作成

## 2 アプリケーション

- **ワイヤレス通信**
- **アナログ・フロント・エンドの電源**
- **試験および計測機器**
- **医療用画像処理**

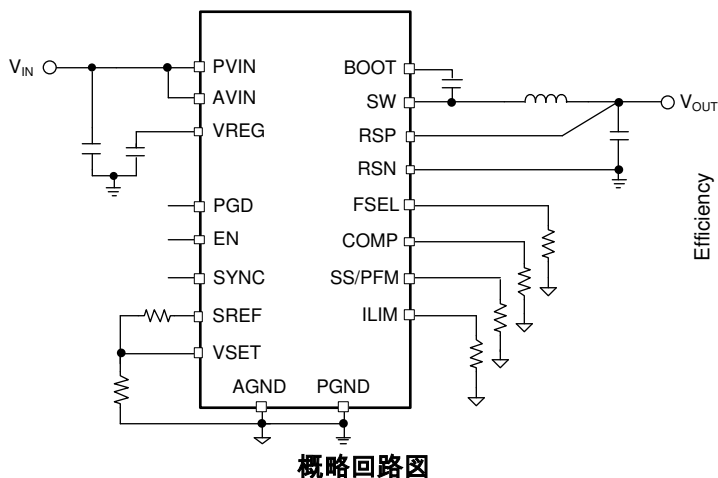

## 3 概要

TPS542A52 は、差動リモート・センス機能を備えた高効率の同期整流式降圧コンバータです。このデバイスは、内部補償機能を備えた固定周波数電圧制御モードを特長としています。この内部補償機能はピンストラップで選択できるため、システム・コストと複雑さを低減できます。PWM は、SYNC ピンを介して外部クロックに同期させることができます。その他の主な特長として、PFM による軽負荷時の効率向上、小さいシャットダウン時静止電流、EN ピンで調整可能な UVLO、プリバイアス条件での単調な起動などがあります。TPS542A52 は鉛フリー・デバイスです。RoHS に完全準拠しています (適用除外なし)。

## 4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

<b>Changes from Revision B (October 2021) to Revision C (December 2021)</b>	<b>Page</b>
• Added the pulse-width limitations on the enable pin.....	14
• Added the resistance-tolerance value recommended to be placed on the $V_{SET}$ resistor divider network.....	14
• Added the maximum voltage ringing level value recommended.....	15
• Added clarification on when Power Good is forced low.....	18
• Added methods on how to prevent an over-current fault trigger at start-up.....	18

<b>Changes from Revision A (October 2020) to Revision B (October 2021)</b>	<b>Page</b>
• Changed " $V_{VRSF}$ " to " $V_{RSP}$ " for $I_Q$ – PFM Mode current test condition in the <i>Electrical Characteristics</i> .....	5
• Changed $R_{FSEL}$ test condition values under <i>Switching Frequency</i> in the <i>Electrical Characteristics</i> .....	5
• Changed "K" to "k" under <i>Switching Frequency</i> in the <i>Electrical Characteristics</i> .....	5
• Changed $R_{ILIM}$ test condition values under <i>Current Sense and Protection</i> in the <i>Electrical Characteristics</i> .....	5
• Changed $R_{FSEL}$ values in 表 7-1 .....	15
• Changed $R_{COMP}$ values in 表 7-2 .....	15
• Changed $R_{SS/PFM}$ values in 表 7-5 .....	17
• Changed $R_{ILIM}$ values in 表 7-7 .....	18
• Updated all figures in セクション 8.2.1.4 to demonstrate new $R_{FSEL}$ , $R_{COMP}$ , $R_{SS/PFM}$ and $R_{ILIM}$ values.....	25

## 5 Pin Configuration and Functions

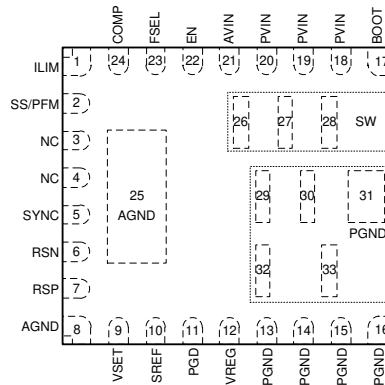

图 5-1. RJM Package 33-Pin VQFN Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AGND	8, 25	G	Ground of the internal analog and digital circuitry
AVIN	21	P	Power input to the controller. Tie this pin to PVIN. It is best to use an RC filter from PVIN such as 10-Ω and 100 nF to 1 μF.
BOOT	17	P	Gate drive voltage for high-side FET. Connect a bootstrap capacitor between this pin and SW.
COMP	24	I	A resistor to ground sets the compensation network. This pin can be grounded to select the default compensation and reduce BOM count.
EN	22	I	Enable pin. Float to enable, enable/disable with an external signal, or adjust the input undervoltage lockout with a resistor divider.
FSEL	23	I	A resistor to ground sets the switching frequency of the converter. This pin can be grounded to select the default switching frequency to reduce BOM count.
ILIM	1	I	A resistor to ground sets the overcurrent protection limit. This pin can be grounded to select default settings and reduce BOM count.
PGD	11	O	Open-drain power good status
PGND	13-16, 29-33	G	Power ground. These pins are internally connected to the return of the internal low-side FET.
PVIN	18-20	P	Power inputs to the power stage. Low impedance bypassing of these pins to PGND is critical. At least 10 nF to 100 nF capacitor from PVIN to PGND is required.
RSN	6	I	Remote sense ground return
RSP	7	I	Remote sense connection to V <sub>OUT</sub>
NC	3	N/A	No connect
NC	4	N/A	No connect
SREF	10	O	1.2-V nominal system reference
SS/PFM	2	I	A resistor to ground sets the soft-start slew rate and PFM mode. To reduce BOM count, this pin can be grounded to use the default soft-start rate and enable PFM mode.
SYNC	5	I	This pin is a clock input for synchronizing the oscillator.
SW	26-28	O	Switch node output of the converter. Connect this pin to the output inductor to ground.
VREG	12	I/O	Bypass pin for the internal power stage LDO. It is recommended to use a 4.7-μF ceramic capacitor.
VSET	9	I	Output voltage reference for the control loop. This must be the mid-point of a resistive divider from SREF to AGND. Set this voltage to be 1/5 of the desired V <sub>OUT</sub> .

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Input	PVIN, AVIN	-0.3	20	V
	PVIN - SW	-0.3	24	
	BOOT	-0.3	27.5	
	BOOT-SW	-0.3	5.5	
	EN, SYNC	-0.3	6	
	FS, COMP, ILIM, SS/PFM, SREF, VSET	-0.3	1.98	
	RSP	-0.3	6	
	PGD	-0.3	6	
Output	SW	-0.3	22	V
	SW transient (<10 ns)	-2	22	
	VREG	-0.3	6	
Operating junction temperature, T <sub>J</sub>		-40	150	°C
Storage temperature, T <sub>stg</sub>		-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>	±2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

T<sub>J</sub> = -40°C to 150°C (unless otherwise noted)

		MIN	NOM	MAX	UNIT
PVIN, AVIN	Input voltage	4	12	18	V
VOUT	Output voltage	0.5		5.5	V
IOUT	Output current	0		15	A
EN		0		5.5	V
SYNC		0		3.3	V
FS, COMP, ILIM, SS/ PFM, SREF, VSET		0		1.8	V
T <sub>J</sub>	Junction temperature	-40		150	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS542A52	UNIT
		RJM (VQFN)	
		33 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	54.9	°C/W
$R_{\theta JA}$	Junction-to-ambient thermal resistance EVM PCB Layout	22.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	23.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	17.7	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	2.7	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	17.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

$T_J = -40^{\circ}\text{C}$  to  $150^{\circ}\text{C}$  (unless otherwise noted)

PARAMETER <sup>(1)</sup>		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>INPUT SUPPLY (PVIN, AVIN PINS)</b>						
$V_{IN}$	PVIN and AVIN supply range		4	12	18	V
$I_Q$	Shutdown current	EN < 0.4 V		17		$\mu\text{A}$
	PFM Mode current	$V_{IN} = 12\text{ V}$ , $V_{OUT} = 1\text{ V}$ , EN > 1.2 V, no switching, $V_{RSP} > 5 \cdot V_{VSET}$		1800		
<b>ENABLE and UVLO (EN PIN)</b>						
$V_{EN}$	Enable threshold: ON/OFF	Rising and falling		1.2		V
$I_{EN}$	Enable input current	Enable threshold – 50 mV		–0.6		$\mu\text{A}$
		Enable threshold + 50 mV		–5		
<b>UVLO (AVIN, PVIN PINS)</b>						
AVIN, PVIN	UVLO rising threshold		3.75	3.85	4	V
	UVLO falling threshold		3.50	3.6	3.7	
	Hysteresis			0.25		
<b>INTERNAL REGULATOR, POWER STAGE (VREG PIN)</b>						
$V_{VREG}$	LDO output voltage	LDO output current = 0A	4.3	4.7	4.96	V
$V_{VREG}$	LDO output voltage	LDO output current = 30mA		4.7		V
	Output current limit	$V_{VREG} = 4.7\text{ V}$	120	170	220	mA
	Nominal output current	$f_{sw} = 2.2\text{ MHz}$ , output current = 15 A, $V_{VREG} = 4.7\text{ V}$		30		mA
$V_{REG(UVLO)}$	UVLO rising threshold			2.8		V
	UVLO falling threshold			2.6		
	UVLO hysteresis			0.2		
<b>CONTROL REFERENCE VOLTAGE (SREF PIN)</b>						
$V_{SREF}$	SREF output voltage	Tolerance included in RSP/RSN accuracy		1.2		V
ISREF	SREF current sourcing capability	Resistance > 6 k $\Omega$			200	$\mu\text{A}$

## 7 Detailed Description

### 7.1 Overview

The TPS542A52 is a high-efficiency, single-channel, synchronous buck converter with integrated n-channel MOSFETs. The device suits low-output voltage point-of-load applications with 15-A or lower current. The TPS542A52 has a maximum operating junction temperature of 150°C making it suitable for high-ambient temperature applications such as wireless infrastructure. The input voltage range is 4 V to 18 V, and the output voltage range is 0.5 V to 5.5 V. The device features a fixed-frequency, voltage-control mode with a switching frequency range of 400 kHz to 2.2 MHz allowing for efficiency and size optimization when selecting output filter components. The controller features selectable internal compensation that makes the device easy to use with low external component count. The internal compensation networks support a wide range of output inductance and capacitance, supporting all types of capacitors. The controller uses a digital PWM modulator that allows for very narrow on-times with low jitter, making it ideal for high-frequency and high-step down ratio applications. The switching frequency of the device can be synchronized to an external clock applied to the SYNC pin.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Enable and Adjustable Undervoltage Lockout

The EN pin provides electrical on/off control of the device. Once the EN pin voltage exceeds the threshold voltage (typically 1.2 V), the device starts operation. If the EN pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low power shutdown.

The EN pin has an internal pullup current source, allowing the user to float the EN pin for enabling the device. The EN pin can also be externally driven high or low. When the pulse-width is less than 22  $\mu$ s, the EN pin will detect the pulse as a low and cause the device to enter hiccup-mode. If the pulse-width is greater than 22  $\mu$ s, then the EN pin will detect the pulse as low but will not enter hiccup-mode.

For adjustable input undervoltage lockout (UVLO), connect the EN pin to the middle point of an external resistor divider. Once the EN pin voltage exceeds the threshold, an additional 5  $\mu$ A of hysteresis current is added to facilitate UVLO hysteresis. 式 1 shows the calculation of resistor divider network.

图 7-1. EN UVLO

$$R_{HS} = \frac{V_{START} - V_{STOP}}{I_H}$$

$$R_{LS} = \frac{R_{HS} \cdot V_{EN}}{V_{STOP} - V_{EN} + R_{HS}(I_P + I_H)}$$

$$V_{EN} = 1.2V; I_P = 0.6\mu A; I_H = 5\mu A$$

(1)

### 7.3.2 Input and VREG Undervoltage Lockout Protection

The TPS542A52 provides fixed VIN and VREG UVLO thresholds and hysteresis. The typical VIN turnon threshold is 3.85 V and hysteresis is 0.25 V. The typical VREG turnon threshold is 2.8 and hysteresis is 0.2 V. There is no power-up sequence. Once all of the UVLO requirements have been met and the EN pin voltage exceeds the enable threshold, the converter begins operation.

### 7.3.3 Voltage Reference and Setting the Output Voltage

The device has a 1.2-V reference that comes out on the SREF pin. To set the reference voltage of the converter, connect the VSET pin to the mid-point of a resistor divider between SREF and AGND. TI recommends that the total impedance of this divider network be > 6 k $\Omega$ . For best accuracy, the resistor's tolerance of 0.1% is recommended. Do not connect anything other than a resistor divider network to SREF.

There is an internal 5:1 resistor divider between the RSP and RSN feedback pins, so the VSET voltage must be set to 1/5 of the desired output voltage. VSET can be programmed to any value between 0.1 and 1.1 V.

### 7.3.4 Remote Sense Function

RSP and RSN pins are used for remote sensing purposes. Always connect RSP to the positive sensing point of the load, and always connect the RSN pin to the load return. There is an internal 5:1 divider in the device, so do

not connect an external feedback resistor divider. The converter loop gain measurement can tolerate 10 Ω to 50 Ω in series with RSP and output voltage.

### 7.3.5 Switching Frequency

The internal oscillator of the device can be set to one of seven switching frequencies by a resistor to ground on the FSEL pin. The FSEL pin can be shorted to ground to reduce BOM component count. When shorted to ground, the default converter switching frequency is used.

**表 7-1. Frequency Resistor Selection**

R <sub>FSEL</sub> (kΩ)	f <sub>sw</sub> (kHz)
Short	1000
7.5	400
18.2	600
26.1	800
35.7	1000
47.5	1200
61.9	2000
78.7	2200

The oscillator can also be synchronized to an external clock on the SYNC pin. The external clock frequency must be within -10% and +15% of the programmed frequency of the converter. The SYNC pin has an internal pulldown so it can be left floating externally.

When the converter operates at 2 MHz or 2.2 MHz, it is recommended to set the OCP at 13 A or lower and without a snubber circuit. For operation with OCP at 16.5 A, a snubber circuit is required. The snubber circuit components can start with a 470-pF cap and 2-Ω resistor to help reduce voltage ringing levels. It is recommended for the ringing levels to be 2-V below the *Absolute Maximum Ratings* between SW and GND at room temperature. The component values will need to be tuned to achieve optimal results.

### 7.3.6 Voltage Control Mode Internal Compensation

The TPS542A52 has 15 unique internal compensation settings to cover a wide range of output inductors and capacitors. For each switching frequency option, there are four compensation options that can be chosen using a single resistor to ground on the COMP pin.

**表 7-2. Compensation Resistor Selection**

R <sub>COMP</sub> (kΩ)++	COMPENSATION SETTING
Short	COMP 2
7.5	COMP 1
18.2	COMP 2
26.1	COMP 3
35.7	COMP 4
47.5	COMP 1
61.9	COMP 2
78.7	COMP 3
102	COMP 4

Each compensation network consists of two zeros and one high frequency pole. 表 7-3 maps the compensation settings to the first zero frequency at different output voltage range, second zero frequency, and high frequency pole.

表 7-3. Compensation Settings

FREQUENCY (kHz)	COMPENSATION SETTING	ZERO 1 (kHz) for VOUT = 0.5 V-1.1 V	ZERO 1 (kHz) for VOUT = 1.2 V-1.5 V	ZERO 1 (kHz) for VOUT = 1.6 V-2.8 V	ZERO 1 (kHz) for VOUT = 2.9 V-4.0 V	ZERO 1 (kHz) for VOUT = 4.1 V-5.5 V	ZERO 2 (kHz)	POLE (kHz)

	COMP 3	18.8	18.2	15.9	14.1	10.6	72.3	796
	COMP 4	37.7	36.4	31.8	28.3	21.2	144.7	1592

表 7-4 shows the second zero frequency placement about two times based on a ratio ( $f_0/f_{SW}$ ) of the LC frequency ( $f_0$ ) to the switching frequency and lists the values in 表 7-3. The second zero frequency does not change with the output voltage. The high frequency pole is about 10 times of the second zero frequency to attenuate the switching frequency noise and to have a safe gain margin.

The output filter LC frequency should be designed between the first and second zero frequencies. The ratio of the LC frequency to the switching frequency in 表 7-4 is a guide to select the LC frequency  $f_0$ . For example, the LC frequency for 1-MHz switching frequency is 10 kHz at 1% ratio. Given 1-V output voltage, COMP2 has the first zero at 4.5 kHz to compensate the LC filter double poles. For the same LC filter and switching frequencies of 3.3-V output voltage, COMP3 has the first zero at 6.7 kHz to compensate the LC filter double poles. The compensation setting needs to consider for the output capacitor derating, especially ceramic capacitor and inductor tolerance. It is recommended to verify the load transient and bode plot based upon the compensation selection.

**表 7-4. Second Zero Frequency**

$f_o/f_{sw}$	COMPENSATION SETTING	SECOND ZERO FREQUENCY
0.5%	COMP 1	~2X of 0.5% $f_o/f_{sw}$
1%	COMP 2	~2X of 1% $f_o/f_{sw}$
2%	COMP 3	~2X of 2% $f_o/f_{sw}$
4%	COMP 4	~2X of 4% $f_o/f_{sw}$

### 7.3.7 Soft Start and Prebiased Output Start-up

The TPS542A52 uses a programmable soft-start rate to gradually ramp the output voltage reference to reduce inrush currents. The device prevents current from being discharged from the output during start-up when a pre-biased condition exists. No switching pulses occur until the internal soft-start reference exceeds the voltage on the error amplifier input voltage (RSP and RSN pins). The TPS542A52 supports the output voltage with pre-bias up to 100%.

The soft-start clock in 表 7-5 can be programmed on the SS/PFM pin along with enabling/disabling PFM and hiccup time. The soft-start timing in 表 7-6 can be programmed based upon the output voltage and soft-start clock. There are four choices of soft-start time to select at different soft-start clock. To prevent an OC fault trigger at start-up, it is recommended to increase the duration of start-time to reduce the inrush current from exceeding the peak current limit. For example of 1-V output voltage, the soft-start time equals to 1.8 ms at 0.5-MHz SS CLK and 0.45 ms at 2.0-MHz SS CLK.

**表 7-5. Soft-Start CLK and PFM Resistor Selection and Hiccup Time**

$R_{SS/PFM}$ (k $\Omega$ ) +	PFM	SS CLK (MHz)	HICCUP DURATION (ms)
Short	Disable	1.0	25.2
7.5	Enable	2.0	12.6
18.2		1.0	25.2
26.1		0.50	50.4
35.7		0.25	100.8
47.5	Disable	2.0	12.6

1	5.0	0.279	1.8	3.6	7.2	14.4

### 7.3.8 Power Good

The power good pin is an open-drain output and needs to pull up to a voltage supply if a designer uses this feature. During normal converter operation, the device leaves this pin floating. Power good warnings occur if the output voltage is not within the OV or UV warning levels. Power Good (PGD) is forced low if OV or UV is exceeded, when the converter is in soft start, and when the converter is in shutdown or programming mode. The PGD pin is released to floating after the PGD delay time when all of the above conditions are met.

TI recommends connecting a pullup resistor to a voltage source that is 5.5 V or less, such as to the device VREG pin.

### 7.3.9 Overvoltage and Undervoltage Protection

An output overvoltage (OV) fault is triggered if the output voltage, sensed by RSP/RSN, is greater than the OVP trip level. When this condition is detected, the converter terminates the switching cycle and turns on the low-side FET to discharge the output voltage. The low-side FET remains on until the low-side FET current reaches the negative overcurrent limit. When the negative overcurrent limit is reached, the low set FET turns off for 2000 ns. After the 2000 ns delay, the low-side FET turns back on until the negative over-current limit is reached. This process repeats until the output voltage is discharged below the undervoltage fault threshold (typically 80% set  $V_{OUT}$ ). The converter then enters hiccup for seven cycles of soft-start CLK frequency due to the output voltage being below the UV threshold.

An output undervoltage fault is triggered if the output voltage, sensed by RSP/RSN, is less than UVP threshold. When this condition is detected, power conversion is disabled, and the converter enters hiccup for seven cycles of soft-start CLK frequency.

### 7.3.10 Overcurrent Protection

The device senses overcurrent (OC) in both the high-side and low-side power MOSFETs using cycle by cycle detection. OC is detected in the low-side FET by sensing the voltage across the FET while it is on. After the low-side FET turns on, there is a blanking time of approximately 70 ns to allow noise to settle before the OC comparator begins sensing. If the peak current limit is hit, then an OC fault condition is detected which causes the device stops switching and enters hiccup for seven cycles of soft-start CLK frequency. The overcurrent limit is set through a single resistor to ground on the ILIM pin. The ILIM pin can be shorted to ground to reduce BOM component count. When shorted to ground the default current limit is used. Current limits shown in [表 7-7](#) can be programmed on the ILIM pin.

**表 7-7. Current Limit Resistor Selection**

$R_{ILIM}$ (k $\Omega$ )	TYPICAL LIMIT (A)
Short	20
7.5	5.5
18.2	8
26.1	10.5
35.7	13
47.5	16.5
61.9	20

The device also senses negative overcurrent in the low-side FET by sensing the voltage across the FET while it is on. After the low-side FET turns on, there is a blanking time to allow noise to settle before the OC comparator begins sensing. Once a negative OC fault condition is detected the device stops switching and enters hiccup for seven cycles of soft-start CLK frequency. The negative overcurrent threshold is fixed to a single value.

Overcurrent is detected in the high-side FET by sensing the voltage across the FET while it is on. After the high-side FET turns on, there is a blanking time to allow noise to settle before the OC comparator begins sensing. Once an OC fault condition is detected, the device stops switching and enters hiccup for seven cycles of soft-start CLK frequency. At start-up, the inrush current has the potential of exceeding the peak current limit, thereby causing the device to enter hiccup. To prevent an OC fault trigger at start-up, it is recommended to increase the soft-start time or decrease the load at the output to reduce the inrush current from exceeding the

peak current limit. The high-side overcurrent threshold is fixed to a single value. For an application with on-time less than 70 ns, the high-side FET over-current is not guaranteed to enable. In this case, the low-side OC will dominate and protect the load while the output current ramps up gradually. With on-times less than 70 ns and a hard short at the load, the controller loop will extend the on-time to respond to the output voltage drooping, and as a result, both high-side and low-side OC protections will engage to protect the load.

### 7.3.11 High-Side FET Throttling

When the high-side FET turns on or off, the ringing voltage across the FET depends on the output current, loop inductance, and PCB parasitic inductance. To diminish the ringing voltage during turning on or off, the TPS542A52 reduces the gate driver strength when TPS542A52 detects PVIN higher than 14 V with 0.5-V hysteresis.

### 7.3.12 Overtemperature Protection

When the device senses a temperature above the thermal shutdown limit (typically 165°C), power conversion is disabled. The converter remains disabled until the temperature cools down to the thermal recovery limit (typically 150°C). At this point the converter enters hiccup for seven cycles of soft-start CLK frequency.

## 7.4 Device Functional Modes

### 7.4.1 Pulse-Frequency Modulation Eco-mode™ Light Load Operation

When the SS/PFM pin is terminated with a 35.7-k $\Omega$  or lower resistance, the TPS542A52 operates in pulse-frequency modulation (PFM) for light load conditions to maintain high efficiency.

As the output current decreases from heavy-load conditions, the inductor current also decreases until the valley of the inductor current reaches zero amps, which is the boundary between continuous-conduction mode (CCM) and discontinuous-conduction mode (DCM). The synchronous MOSFET turns off when this zero inductor current is detected. As the load current decreases further, the converter runs in DCM. In DCM operation, the on-time is maintained to a level approximately the same as during CCM and the converter off-time is modulated to maintain the proper output voltage. For the application of 5-V input voltage, it is not recommended to operate in PFM due to the accuracy of the zero comparator which will be reduced because of the low input voltage.

### 7.4.2 Forced Continuous-Conduction Mode

When the SS/PFM pin is terminated with a 47.5-k $\Omega$  or higher resistance, the TPS542A52 operates in forced continuous conduction mode (FCCM) for all load currents. During FCCM, the switching frequency is set by an internal oscillator for which the frequency can either be selected by the FSEL pin or an external clock on the SYNC pin.

### 7.4.3 Soft Start

The TPS542A52 operates in FCCM during soft start regardless of the setting selected by the SS/PFM pin. If PFM is enabled by the SS/PFM pin, the PFM operation begins after PGD is asserted. The delay between soft start finishing and PGD being asserted is typically 500  $\mu$ s. During the start-up, the TPS542A52 has the low-side current limit at 16.5 A when the OCP configures 20 A. However, if the OCP configures below 16.5 A such as 13 A, then the current limit during soft start sets to be at 13 A. To prevent an OC fault trigger at start-up, it is recommended to increase the duration of soft-start time to reduce the inrush current from exceeding the peak current limit.

## 8 Application and Implementation

### Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 8.1 Application Information

The TPS542A52 is a high-efficiency, single-channel, synchronous buck converter with integrated n-channel MOSFETs. The device suits low-output voltage point-of-load applications with 15-A or lower current. The TPS542A52 has a maximum operating junction temperature of 150°C, which makes it suitable for high-ambient temperature applications such as wireless infrastructure. The input voltage range is 4 V to 18 V, and the output voltage range is 0.5 V to 5.5 V. The device features a fixed-frequency voltage-control mode with a switching frequency range of 400 kHz to 2.2 MHz, allowing for efficiency and size optimization when selecting output filter components. The controller features selectable internal compensation making the device easy to use with a low external-component count. The internal compensation networks are able to support a wide range of output inductance and capacitance, supporting all types of capacitors. The controller utilizes a digital PWM modulator that allows for very narrow on-times making it ideal for high-frequency and high-step down ratio applications. The switching frequency of the device can be synchronized to an external clock applied to the SYNC pin.

### 8.2 Typical Application

#### 8.2.1 Full Analog Configuration

A resistor to ground on the FSEL, COMP, SS/PFM, and ILIM pins configure the device. Any of these pins can be grounded to use the default values and reduce component count.

図 8-1. Full Analog Configuration

#### 8.2.1.1 Design Requirements

For this design example, use the input parameters shown in 表 8-1.

表 8-1. Design Example Specifications

PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
$V_{IN}$ , Input Voltage		9	12	14	V
$V_{IN(ripple)}$ , Input Ripple Voltage				0.2	V
$V_{OUT}$ , Output Voltage			1		V
$V_{PP}$ , Output Ripple Voltage			15		mV
$V_{OVER}$ , Transient Response Overshoot	$I_{STEP} = 5\text{ A at } 1\text{ A}/\mu\text{s}$		30		mV

**表 8-1. Design Example Specifications (continued)**

PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
V <sub>UNDER</sub> , Transient Response Undershoot	I <sub>STEP</sub> = 5 A at 1 A/μs		30		mV
I <sub>OUT</sub> , Output Current			10		A
I <sub>OC</sub> , Over-Current Trip Point			16		A
F <sub>SW</sub> , Switching Frequency			1.2		MHz
t <sub>SS</sub> , Soft-start time			0.5		ms

### 8.2.1.2 Detailed Design Procedure

#### 8.2.1.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPS542A52 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V<sub>IN</sub>), output voltage (V<sub>OUT</sub>), and output current (I<sub>OUT</sub>) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

#### 8.2.1.2.2 Output Voltage Calculation

The output voltage equals five times of VSET. To set VSET voltage, a resistor divider network is required from SREF (1.2 V). 式 2 shows the output voltage calculation. It is recommended to use R<sub>1</sub> and R<sub>2</sub> in the range of 1 kΩ to 100 kΩ with a resistance-tolerance of 0.1% for best accuracy and that the total impedance of this divider network be > 6 kΩ. For example, R<sub>1</sub> equals 50 kΩ and R<sub>2</sub> equals 10 kΩ for 1-V output voltage.

$$V_{OUT} = 5 \times V_{SET}$$

$$V_{SET} = \frac{R_2}{R_1 + R_2} \times 1.2$$

$$V_{OUT} = 5 \times \frac{R_2}{R_1 + R_2} \times 1.2 \tag{2}$$

#### 8.2.1.2.3 Switching Frequency Selection

There is a trade off between higher and lower switching frequencies. Higher switching frequencies can produce a smaller solution size using lower valued inductors and smaller output capacitors compared to a power supply that switches at a lower frequency. However, the higher switching frequency causes extra switching losses, which decrease efficiency and impacts thermal performance. In this design, a moderate switching frequency of 1.2 MHz achieves both a small solution size and a high efficiency operation is selected. The TPS542A52 offers seven choices of switching frequency in 表 7-1. RFSET equals to 47.5 kΩ for 1.2-MHz switching frequency.

#### 8.2.1.2.4 Inductor Selection

The inductor value is a compromise between having a good load step transient response, output ripple voltage, and efficiency. A good practice is to select the inductor ripple current value between 15% to 50% of the maximum output current. The output capacitor absorbs the inductor-ripple current. Therefore, selecting a high inductor-ripple current impacts the selection of the output capacitor because the output capacitor must have a ripple-current rating equal to or greater than the inductor-ripple current. Using 35% target ripple current, the required inductor size can be calculated as shown in 式 3.

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times f_{SW} \times I_{OUT} \times 0.35} = \frac{1.0 \text{ V} \times (12 \text{ V} - 1.0 \text{ V})}{12 \text{ V} \times 1.2 \text{ MHz} \times 10 \text{ A} \times 0.35} = 218 \text{ nH} \quad (3)$$

A standard inductor value of 220 nH is selected.

#### 8.2.1.2.5 Input Capacitor Selection

The TPS542A52 requires a high-quality, ceramic, type X5R or X7R, input decoupling capacitor with a value of at least 1  $\mu\text{F}$  of effective capacitance on the PVIN pin, relative to PGND. The power stage input decoupling capacitance (effective capacitance at the PVIN and PGND pins) must be sufficient to supply the high switching currents demanded when the high-side MOSFET switches on, while providing minimal input voltage ripple as a result. This effective capacitance includes any DC bias effects. The voltage rating of the input capacitor must be greater than the maximum input voltage. The capacitor must also have a ripple current rating greater than the maximum input current ripple to the device during full load. The input ripple current can be calculated by 式 4.

$$I_{CIN(rms)} = I_{OUT(max)} \times \sqrt{\frac{V_{OUT}}{V_{IN}} \times \frac{(V_{IN} - V_{OUT})}{V_{IN}}} = 2.8 \text{ Amps} \quad (4)$$

The minimum input capacitance and ESR values for a given input voltage ripple specification,  $V_{IN(ripple)}$ , are shown in 式 5. The input ripple is composed of a capacitive portion,  $V_{IN(RIPPLE\_CAP)}$ , and a resistive portion,  $V_{IN(RIPPLE\_ESR)}$ .

$$C_{IN(min)} = \frac{I_{OUT(max)} \times (1 - D) \times D}{V_{IN(RIPPLE\_CAP)} \times f_{SW}} = 6.4 \mu\text{F}$$

$$ESR_{CIN(max)} = \frac{V_{IN(RIPPLE\_ESR)}}{I_{OUT(max)} + \frac{I_{RIPPLE}}{2}} = 8.5 \text{ m}\Omega$$

where

- D is the duty cycle (5)

The value of a ceramic capacitor varies significantly over temperature and the amount of DC bias applied to the capacitor. The capacitance variations due to temperature can be minimized by selecting a dielectric material that is stable over temperature. X5R and X7R ceramic dielectrics are usually selected for power regulator capacitors because they have a high capacitance-to-volume ratio and are fairly stable over temperature. The input capacitor must also be selected with the DC bias taken into account. For this example design, a ceramic capacitor with at least a 25-V voltage rating is required to support the maximum input voltage. For this design, allow 0.1-V input ripple for  $V_{IN(RIPPLE\_CAP)}$ , and 0.1-V input ripple for  $V_{IN(RIPPLE\_ESR)}$ . Using 式 5, the minimum input capacitance for this design is 6.4  $\mu\text{F}$ , and the maximum ESR is 8.5  $\text{m}\Omega$ . In a real application, it is recommended to use a combination of small capacitors such as 0.1- $\mu\text{F}$  and larger value 10- $\mu\text{F}$  or 22- $\mu\text{F}$  ceramic capacitors in parallel for the power stage.

#### 8.2.1.2.6 Bootstrap Capacitor Selection

A ceramic capacitor with a value of 0.1  $\mu\text{F}$  must be connected between the BOOT and SW pins for proper operation. It is recommended to use a ceramic capacitor with X5R or better grade dielectric. Use a capacitor with a voltage rating of 25 V or higher.

#### 8.2.1.2.7 R-C Snubber and VIN Pin High-Frequency Bypass

Though it is possible to operate the TPS542A52 within absolute maximum ratings without voltage ringing reduction techniques, some designs can require external components to further reduce ringing levels. This example uses two approaches: a high frequency power stage bypass capacitor on the VIN pins, and an R-C snubber between the SW area and GND.

The high-frequency VIN bypass capacitor is a lossless ringing reduction technique which helps minimize the outboard parasitic inductances in the power stage, which store energy during the high-side MOSFET on-time,

and discharge once the high-side MOSFET is turned off. For this example two of 0.1-μF to 1-μF, 25-V, 0402-sized high-frequency capacitors are used. The placement of these capacitors is critical to its effectiveness.

Additionally, an optional R-C snubber circuit is added to this example. To balance efficiency and spike levels, a 220-pF capacitor and a 2-Ω resistor are chosen. In this example, a 0805-sized resistor is chosen, which is rated for 0.125 W, nearly twice the estimated power dissipation. It is recommended for the R-C snubber circuit to sustain the ringing levels 2-V below the *Absolute Maximum Ratings* at room temperature. See the [Seminar 900 Topic 2 - Snubber Circuits: Theory, Design and Application](#) application note for more information about snubber circuits.

### 8.2.1.2.8 Output Capacitor Selection

There are three primary considerations for selecting the value of the output capacitor. The output capacitor affects three criteria:

- Stability
- Regulator response to a change in load current or load transient
- Output voltage ripple

These three considerations are important when designing regulators that must operate where the electrical conditions are unpredictable. The output capacitance needs to be selected based on the most stringent of these three criteria.

### 8.2.1.2.9 Response to a Load Transient

The output capacitance must supply the load with the required current when current is not immediately provided by the regulator. When the output capacitor supplies load current, the impedance of the capacitor greatly affects the magnitude of voltage deviation (such as undershoot and overshoot) during the transient.

Use 式 6 and 式 7 to calculate the minimum output capacitance to meet the undershoot and overshoot requirements. For this example,  $C_{OUT(min\_under)}$  is 136-μF and 92-μF for  $C_{OUT(min\_over)}$ . In a real application, the value of a ceramic capacitor varies significantly over temperature and the amount of DC bias applied to the capacitor. It is recommended to check the capacitor datasheet and account for the capacitance derating.

$$C_{OUT(min\_under)} = \frac{L \times \Delta I_{LOAD(max)}^2}{2 \times \Delta V_{LOAD(INSERT)} \times (V_{IN} - V_{OUT})} + \frac{\Delta I_{LOAD(max)} \times (1 - D) \times t_{SW}}{\Delta V_{LOAD(INSERT)}} \quad (6)$$

$$C_{OUT(min\_over)} = \frac{L_{OUT} \times (\Delta I_{LOAD(max)})^2}{2 \times \Delta V_{LOAD(release)} \times V_{OUT}} \quad (7)$$

where

- $C_{OUT(min\_under)}$  is the minimum output capacitance to meet the undershoot requirement
- $C_{OUT(min\_over)}$  is the minimum output capacitance to meet the overshoot requirement
- D is the duty cycle
- L is the output inductance value (0.22 μH)
- $\Delta I_{LOAD(max)}$  is the maximum transient step (5 A)
- $V_{OUT}$  is the output voltage value (1 V)
- $t_{SW}$  is the switching period (0.833 μs)
- $V_{IN}$  is the minimum input voltage for the design (12 V)
- $\Delta V_{LOAD(insert)}$  is the undershoot requirement (30 mV)
- $\Delta V_{LOAD(release)}$  is the overshoot requirement (30 mV)

### 8.2.1.2.10 Pin-Strap Setting

For overcurrent protection at 16.5 A, 47.5 kΩ is chosen from 表 7-7. For 0.5-ms soft start and FCCM operation, 47.5 kΩ is chosen from 表 7-5 and 表 7-6.

For converter stability and selecting the compensation network, 表 7-3 provides four compensation choices. First, the power stage double pole filter frequency needs to be known. For this example, the output capacitor

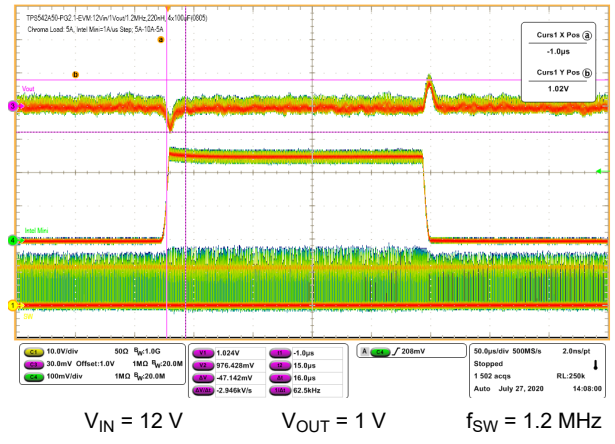

bank selects as 4x100- $\mu$ F ceramic capacitors in 0805 size to account the capacitor derating factors. Next, the LC filter frequency is calculated to 17 kHz. Finally, COMP3 becomes the best choice to select by using a 26.1-k $\Omega$  or 78.7-k $\Omega$  resistor on the COMP pin to GND.

### 8.2.1.3 Application Curves

$V_{IN} = 12\text{ V}$        $V_{OUT} = 1\text{ V}$        $f_{SW} = 1.2\text{ MHz}$

图 8-8. Typical Application Circuit for 5-V Output at 0.6 MHz

## 9 Power Supply Recommendations

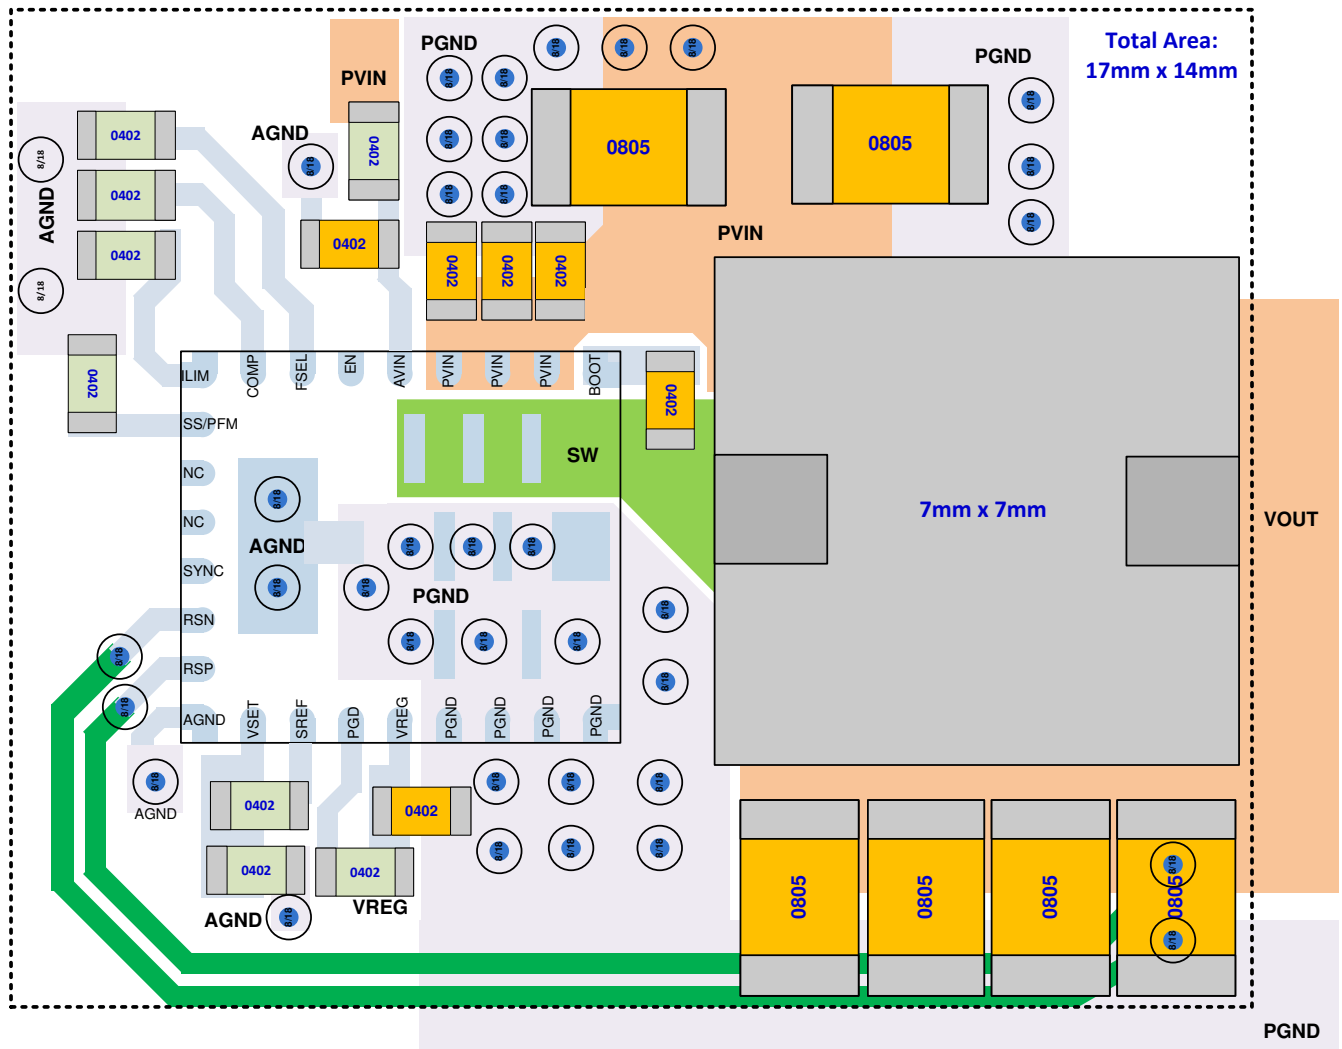

The device is designed to operate from an input voltage supply range between 4 V and 18 V. This input supply must be well regulated. Proper bypassing of input supplies (AVIN and PVIN) is critical for noise performance, as is the PCB layout and grounding scheme. See the recommendations in [セクション 10](#).

## 10 Layout

### 10.1 Layout Guidelines

1. The PVIN pins are the power inputs to the main half bridge and AVIN is the power input to the controller.
2. Connect AVIN and PVIN together on the PCB. It is important that these pins are at the same voltage potential because the controller feedforward block uses this voltage information in the modulator to increase transient performance. For AVIN, it is best to use RC filter from PVIN such as 10  $\Omega$  and 100 nF.
3. To minimize the power loop inductance for the half bridge, place the bypassing capacitors as close as possible to the PVIN pins on the converter. When using a multilayer PCB (more than two layers), the power loop inductance is minimized by having the return path to the input capacitor small and directly underneath the first layer as shown below. Loop inductance is reduced due to flux cancellation as the return current is directly underneath and flowing in the opposite direction.
4. Place the bias capacitor for VREG pin as close as possible to the pin as shown below.
5. The resistor divider network for SREF and VSET needs to be placed as close as possible to the pins. Limit the high frequency noise source coupling onto these components.
6. RSP and RSN signals are best to route parallel to the load sense location. It is recommended to limit high frequency noise source coupling onto these traces.
7. PGND thermal vias: It is recommended to add vias under and outside the IC of PGND plane as shown below.
8. AGND thermal vias: It is recommended to add at least 2 vias under the IC of AGND plane as shown below.
9. AGND plane can be routed as separate island in an internal layer. AGND can connect as a net tied to PGND between the two thermal grounds under the IC as shown below.
10. Total PCB area can be routed in 17 mm by 14 mm as shown below. See the EVM userguide for more details.

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Development Support

##### 11.1.1.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPS542A52 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.3 サポート・リソース

TI E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の [使用条件](#) を参照してください。

### 11.4 Trademarks

Eco-mode™ and TI E2E™ are trademarks of Texas Instruments.

WEBENCH® is a registered trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS542A52RJMR	ACTIVE	VQFN-HR	RJM	33	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 150	542A52	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

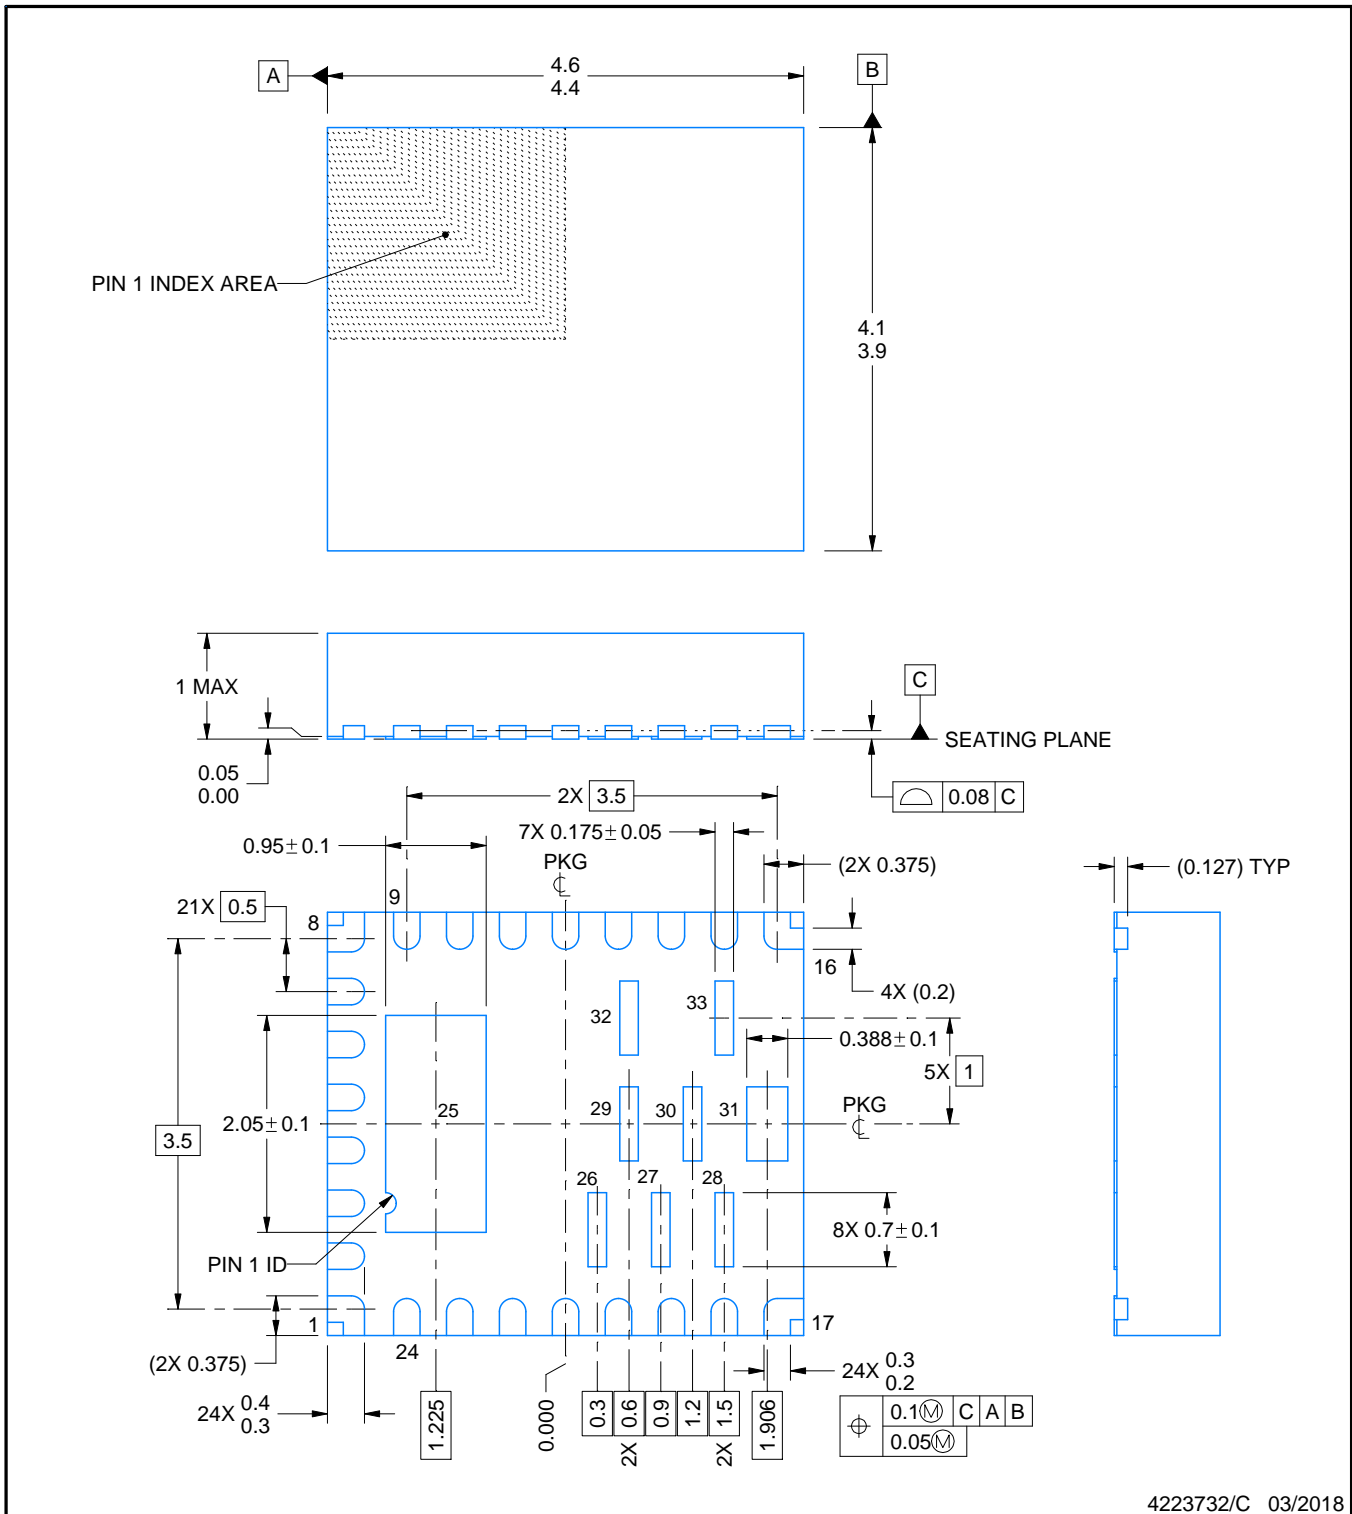

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
