TEXAS INSTRUMENTS
DAC7568, DAC8168, DAC8568
JAJS398F – JANUARY 2009 – REVISED APRIL 2018

DAC7568、DAC8168、DAC8568 12/14/16ビット、8チャネル、超低グリッチ、電圧出力デジタル/アナログ・コンバータ、2.5V 2ppm/℃の内部基準電圧搭載

1 特長

- 相対精度
  - DAC7568 (12ビット): 0.3 LSB INL
  - DAC8168 (14ビット): 1 LSB INL
  - DAC8568 (16ビット): 4 LSB INL
- グリッチ・エネルギー: 0.1nV-s
- 内部基準電圧
  - 2.5V基準電圧(デフォルトで無効)
  - 0.004%の初期精度(標準値)
  - 2ppm/℃の温度ドリフト係数(標準値)
  - 5ppm/℃の温度ドリフト係数(最大値)
  - 20mAのシンク/ソース能力
- パワーオン時にゼロ・スケールまたは中間スケールにリセット
- 超低消費電力での動作: 内部基準電流も含めて5Vで1.25mA
- 広い電源電圧範囲: +2.7V～+5.5V
- 温度範囲全体にわたる単調性
- シュミット・トリガ入力を持つ低消費電力シリアル・インターフェイス: 最高50MHz
- レール・ツー・レール動作のオンチップ出力バッファ・アンプ
- 温度範囲: -40°C～+125°C

2 アプリケーション

- 携帯機器
- 閉ループのサーボ制御/プロセス制御
- データ収集システム
- プログラム可能な減衰、デジタル・ゲイン、オフセットの調整
- プログラム可能な電圧源および電流源

3 概要

DAC7568、DAC8168、DAC8568は低消費電力、電圧出力、8チャネル、12/14/16ビットのデジタル/アナログ・コンバータ(DAC)です。これらのデバイスには2.5V、2ppm/℃の内部基準電圧(デフォルトでは無効)が含まれており、フルスケール出力電圧範囲は2.5V～5Vです。内部基準電圧の初期精度は0.004%で、$V_{REF}IN/V_{REF}OUT$ピンで最大20mAを供給できます。これらのデバイスは単調で、線形性に優れており、望ましくないコード間の過渡電圧(グリッチ)が最小化されます。他用途な3線式のシリアル・インターフェイスを使用し、最高50MHzのクロック速度で動作します。インターフェイスは、標準の SPI™、QSPI™、Microwire™、デジタル信号プロセッサ(DSP)インターフェイスと互換性があります。

製品情報(1)

型番	パッケージ	本体サイズ(公称)
DAC7568	TSSOP (14)	5.00mm×4.40mm
	TSSOP (16)	5.00mm×4.40mm
DAC8168	TSSOP (14)	5.00mm×4.40mm
	TSSOP (16)	5.00mm×4.40mm
DAC8568	TSSOP (16)	5.00mm×4.40mm

目次

4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Revision E (January 2014) から **Revision F** に変更 **Page**

- データシートをSDS標準に更新 ... 1
- Added External reference current grades and updated typ values ... 7
- Added Reference input impedance grades and updated typ values ... 7
- Changed I_{DD} Normal mode, internal reference switched on, AV_{DD} = 3.6V to 5.5V, $V_{IN}H = AV_{DD}$ and $V_{IN}L$ = GND maximum value from 2.0mA to 2.5mA ... 8

Revision D (May 2012) から **Revision E** に変更 **Page**

- Changed bit value in last three rows of *Power-Down Commands* section in from '0' to '1' ... 39

Revision C (February 2011) から **Revision D** に変更 **Page**

- Changed Logic Input HIGH Voltage parameter test condition into two rows ... 8

Revision B (November 2010) から **Revision C** に変更 **Page**

- Changed Output Voltage parameter min/max values from 2.4895 and 2.5005 to 2.4975 and 2.5025, respectively ... 7
- Changed Initial Accuracy parameter min/max values from –0.02 and 0.02 to –0.1 and 0.1, respectively ... 7

Revision A (April 2009) から **Revision B** に変更 **Page**

- Changed Logic Input LOW Voltage parameter maximum value from 0.8 to 0.3 × AV_{DD} ... 8
- Changed Logic Input HIGH Voltage parameter minimum value from 1.8 to 0.7 × AV_{DD} ... 8
- Updated Figure 122 ... 34

5 概要（続き）

DAC7568、DAC8168、DAC8568にはパワーオン・リセット回路が組み込まれており、電源オン時にDAC出力電力がゼロ・スケールまたは中間スケールになり、デバイスに有効なコードが書き込まれるまでその状態に維持されることが保証されます。これらのデバイスには、シリアル・インターフェイスでアクセス可能なパワーダウン機能が含まれており、消費電流が5Vで0.18μA (標準値)に低減します。消費電力(内部基準電圧を含む)は3V時に標準値2.9mWで、パワーダウン・モードでは1μW未満に低減します。低い消費電力、内蔵の基準電圧、小さな占有面積から、これらのデバイスは携帯用のバッテリ動作の機器に理想的です。

DAC7568、DAC8168、DAC8568は互いにドロップイン互換および機能互換であり、TSSOP-16およびTSSOP-14パッケージで供給されます。

6 Device Comparison Table

PRODUCT	MAXIMUM RELATIVE ACCURACY (LSB)	MAXIMUM DIFFERENTIAL NONLINEARITY (LSB)	MAXIMUM REFERENCE DRIFT (ppm/°C)	OUTPUT VOLTAGE FULL-SCALE RANGE	RESET TO	RESOLUTION
DAC8568A	±12	±1	25	2.5V	Zero	16
DAC8568B	±12	±1	25	2.5V	Midscale	16

Pin Functions

16-PIN	14-PIN	NAME	DESCRIPTION
1	—	$\overline{\text{LDAC}}$	Load DACs.
2	1	$\overline{\text{SYNC}}$	Level-triggered control input (active low). This input is the frame synchronization signal for the input data. When $\overline{\text{SYNC}}$ goes low, it enables the input shift register, and data are sampled on subsequent falling clock edges. The DAC output updates following the 32nd clock. If $\overline{\text{SYNC}}$ is taken high before the 31st clock edge, the rising edge of $\overline{\text{SYNC}}$ acts as an interrupt, and the write sequence is ignored by the DAC7568/DAC8168/DAC8568. Schmitt-Trigger logic input.
3	2	AV_{DD}	Power-supply input, 2.7V to 5.5V
4	3	$V_{OUT}A$	Analog output voltage from DAC A
5	4	$V_{OUT}C$	Analog output voltage from DAC C
6	5	$V_{OUT}E$	Analog output voltage from DAC E
7	6	$V_{OUT}G$	Analog output voltage from DAC G
8	7	$V_{REF}IN$/ $V_{REF}OUT$	Positive reference input / reference output 2.5V if internal reference used.(1)
9	—	$\overline{\text{CLR}}$	Asynchronous clear input.
10	8	$V_{OUT}H$	Analog output voltage from DAC H
11	9	$V_{OUT}F$	Analog output voltage from DAC F
12	10	$V_{OUT}D$	Analog output voltage from DAC D
13	11	$V_{OUT}B$	Analog output voltage from DAC B
14	12	GND	Ground reference point for all circuitry on the device
15	13	D_{IN}	Serial data input. Data are clocked into the 32-bit input shift register on each falling edge of the serial clock input. Schmitt-Trigger logic input.
16	14	SCLK	Serial clock input. Data can be transferred at rates up to 50MHz. Schmitt-Trigger logic input.

(1) Grades A and B, external $V_{REF}IN$ (max) ≤ AV_{DD}; grades C and D, external $V_{REF}IN$ (max) ≤ $AV_{DD}/2$.

8 Specifications

8.1 Absolute Maximum Ratings(1)

Over operating free-air temperature range (unless otherwise noted).

PARAMETER	MIN	MAX	UNIT
AV_{DD} to GND	–0.3	6	V
Digital input voltage to GND	–0.3	AV_{DD} + 0.3	V
V_{OUT} to GND	–0.3	AV_{DD} + 0.3	V
V_{REF} to GND	–0.3	AV_{DD} + 0.3	V
Operating temperature range	–40	125	°C
Storage temperature range	–65	150	°C
Junction temperature range (T_J max)		150	°C
Power dissipation	$(T_J \text{ max} – T_A)/\theta_{JA}$		W
Thermal impedance, $R_{\theta JA}$	118		°C/W
Thermal impedance, $R_{\theta JC}$	29		°C/W

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

8.2 Electrical Characteristics

At AV_{DD} = 2.7V to 5.5V and over –40°C to +125°C (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE(1)						
DAC8568	Resolution		16			Bits
	Relative accuracy	Measured by the line passing through codes 485 and 64714		±4	±12	LSB
	Differential nonlinearity	16-bit monotonic		±0.2	±1	LSB
DAC8168	Resolution		14			Bits
	Relative accuracy	Measured by the line passing through codes 120 and 16200		±1	±4	LSB
	Differential nonlinearity	14-bit monotonic		±0.1	±0.5	LSB
DAC7568	Resolution		12			Bits
	Relative accuracy	Measured by the line passing through codes 30 and 4050		±0.3	±1	LSB
	Differential nonlinearity	12-bit monotonic		±0.05	±0.25	LSB
Offset error		Extrapolated from two-point line(1), unloaded		±1	±4	mV
Offset error drift				±0.5		µV/°C
Full-scale error		DAC register loaded with all '1's		±0.03	±0.2	% of FSR
Zero-code error		DAC register loaded with all '0's		1	4	mV
Zero-code error drift				±2		µV/°C
Gain error		Extrapolated from two-point line(1), unloaded		±0.01	±0.15	% of FSR
Gain temperature coefficient				±1		ppm of FSR/°C

(1) 16-bit: codes 485 and 64714; 14-bit: codes 120 and 16200; 12-bit: codes 30 and 4050

Electrical Characteristics (continued)

At AV_{DD} = 2.7V to 5.5V and over –40°C to +125°C (unless otherwise noted).

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT
OUTPUT CHARACTERISTICS(2)						
Output voltage range	AV_{DD} ≥ 2.7V; grades A and B: maximum output voltage 2.5V when using internal reference		0		AV_{DD}	V
	AV_{DD} ≥ 5V; grades C and D: maximum output voltage 5V when using internal reference					
Output voltage settling time	DACs unloaded; 1/4 scale to 3/4 scale to ±0.024%			5	10	µs
	R_L = 1MΩ			10		
Slew rate				0.75		V/µs
Capacitive load stability	R_L = ∞			1000		pF
	R_L = 2kΩ			3000		
Code change glitch impulse	1LSB change around major carry			0.1		nV-s
Digital feedthrough	SCLK toggling, $\overline{SYNC}$ high			0.1		nV-s
Power-on glitch impulse	R_L = 2kΩ, C_L = 470pF, AV_{DD} = 5.5V			10		mV
	R_L = 2kΩ, C_L = 470pF, AV_{DD} = 2.7V			6		mV
Channel-to-channel dc crosstalk	Full-scale swing on adjacent channel			0.1		LSB
Channel-to-channel ac crosstalk	R_L = 2kΩ, C_L = 420pF, 1kHz full-scale sine wave, outputs unloaded			–109		dB
DC output impedance	At mid-code input			4		Ω
Short-circuit current	DAC outputs at full-scale, DAC outputs shorted to GND			11		mA
Power-up time, including settling time	Coming out of power-down mode			50		µs
AC PERFORMANCE(2)						
SNR	T_A = +25°C, BW = 20kHz, AV_{DD} = 5V, f_{OUT} = 1kHz, first 19 harmonics removed for SNR calculation, at 16-bit level			83		dB
THD				–63		dB
SFDR				63		dB
SINAD				62		dB
DAC output noise density	T_A = +25°C, at zero-code input, f_{OUT} = 1kHz			90		nV/√Hz
DAC output noise	T_A = +25°C, at mid-code input, 0.1Hz to 10Hz			2.6		μV_{PP}
REFERENCE						
Internal reference current consumption	AV_{DD} = 5.5V			360		µA
	AV_{DD} = 3.6V			348		µA
External reference current	External V_{REF} = 2.5V (when internal reference is disabled), all eight channels active	Grades A/B		60		µA
		Grades C/D		115		
V_{REF}IN Reference input range	Grades A/B, AV_{DD} = 2.7V to 5.5V		0		AV_{DD}	V
	Grades C/D, AV_{DD} = 5.0V to 5.5V		0		AV_{DD}/2	V
Reference input impedance	Grades A/B			44		kΩ
	Grades C/D			22		
REFERENCE OUTPUT						
Output voltage	T_A = +25°C; all grades		2.4975	2.5	2.5025	V
Initial accuracy	T_A = +25°C, all grades		–0.1	±0.004	0.1	%
Output voltage temperature drift	DAC7568/DAC8168/DAC8568(3),grades A/B			5	25	ppm/°C
	DAC7568/DAC8168/DAC8568(4), grades C/D			2	5	
Output voltage noise	f = 0.1Hz to 10Hz			12		μV_{PP}
Output voltage noise density (high-frequency noise)	T_A = +25°C, f = 1MHz, C_L = 0µF			50		nV/√Hz
	T_A = +25°C, f = 1MHz, C_L = 1µF			20		
	T_A = +25°C, f = 1MHz, C_L = 4µF			16		
Load regulation, sourcing(5)	T_A = +25°C			30		µV/mA
Load regulation, sinking(5)	T_A = +25°C			15		µV/mA

(2) Specified by design or characterization; not production tested.
(3) Reference is trimmed and tested at room temperature, and is characterized from –40°C to +125°C.
(4) Reference is trimmed and tested at two temperatures (+25°C and +105°C), and is characterized from –40°C to +125°C.
(5) Explained in more detail in the *Application Information* section of this data sheet.

Electrical Characteristics (continued)

At AV_{DD} = 2.7V to 5.5V and over –40°C to +125°C (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Output current load capability(2)				±20		mA
Line regulation		T_A = +25°C		10		µV/V
Long-term stability/drift (aging)(5)		T_A = +25°C, time = 0 to 1900 hours		50		ppm
Thermal hysteresis(5)		First cycle		100		ppm
		Additional cycles		25		
LOGIC INPUTS(2)						
Input current				±1		µA
$V_{IN}L$	Logic input LOW voltage	2.7V ≤ AV_{DD} ≤ 5.5V			0.3 × AV_{DD}	V
$V_{IN}H$	Logic input HIGH voltage	2.7V ≤ AV_{DD} < 4.5V	0.7 × AV_{DD}			V
		4.5V ≤ AV_{DD} ≤ 5.5V	0.625 × AV_{DD}			V
Pin capacitance					3	pF
POWER REQUIREMENTS						
AV_{DD}			2.7		5.5	V
I_{DD} (6)	Normal mode, internal reference switched off	AV_{DD} = 3.6V to 5.5V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		0.95	1.4	mA
		AV_{DD} = 2.7V to 3.6V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		0.81	1.3	
	Normal mode, internal reference switched on	AV_{DD} = 3.6V to 5.5V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		1.25	2.5	mA
		AV_{DD} = 2.7V to 3.6V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		1.1	1.9	
	All power-down modes	AV_{DD} = 3.6V to 5.5V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		0.18	3	µA
		AV_{DD} = 2.7V to 3.6V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		0.10	2.5	
Power dissipation(6)	Normal mode, internal reference switched off	AV_{DD} = 3.6V to 5.5V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		3.4	7.7	mW
		AV_{DD} = 2.7V to 3.6V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		2.2	4.7	
	Normal mode, internal reference switched on	AV_{DD} = 3.6V to 5.5V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		4.5	11	mW
		AV_{DD} = 2.7V to 3.6V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		2.9	6.8	
	All power-down modes	AV_{DD} = 3.6V to 5.5V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		0.6	16	µW
		AV_{DD} = 2.7V to 3.6V $V_{IN}H$ = AV_{DD} and $V_{IN}L$ = GND		0.3	9	
TEMPERATURE RANGE						
Specified performance			–40		+125	°C

(6) Input code = midscale, no load.

8.3 Timing Requirements(1) (2)

At AV_{DD} = 2.7V to 5.5V and over –40°C to +125°C (unless otherwise noted).

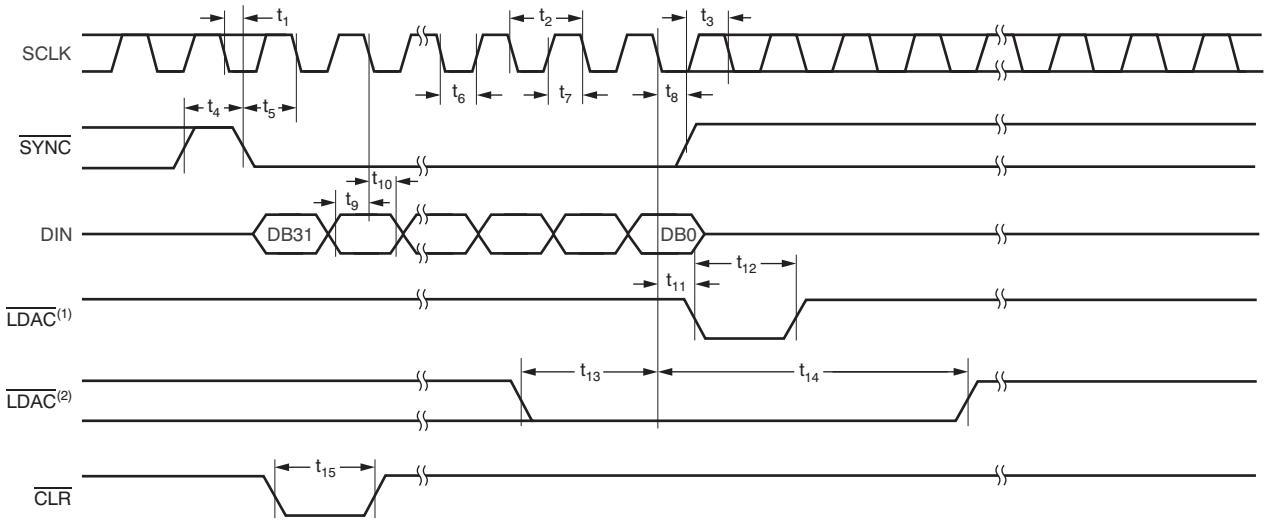
	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_1	SCLK falling edge to $\overline{SYNC}$ falling edge (for successful write operation)	AV_{DD} = 2.7V to 5.5V	10			ns
t_2 (3)	SCLK cycle time	AV_{DD} = 2.7V to 5.5V	20			ns
t_3	$\overline{SYNC}$ rising edge to 31st SCLK falling edge (for successful $\overline{SYNC}$ interrupt)	AV_{DD} = 2.7V to 5.5V	13			ns
t_4	Minimum $\overline{SYNC}$ HIGH time	AV_{DD} = 2.7V to 5.5V	80			ns

(1) All input signals are specified with t_R = t_F = 3ns (10% to 90% of AV_{DD}) and timed from a voltage level of (V_{IL} + V_{IH})/2.
(2) See the *Serial Write Operation* timing diagram.
(3) Maximum SCLK frequency is 50MHz at AV_{DD} = 2.7V to 5.5V.

Timing Requirements(1) (2) (continued)

At AV_{DD} = 2.7V to 5.5V and over –40°C to +125°C (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_5	$\overline{SYNC}$ to SCLK falling edge setup time	AV_{DD} = 2.7V to 5.5V	13			ns
t_6	SCLK LOW time	AV_{DD} = 2.7V to 5.5V	8			ns
t_7	SCLK HIGH time	AV_{DD} = 2.7V to 5.5V	8			ns
t_8	SCLK falling edge to $\overline{SYNC}$ rising edge	AV_{DD} = 2.7V to 5.5V	10			ns
t_9	Data setup time	AV_{DD} = 2.7V to 5.5V	6			ns
t_{10}	Data hold time	AV_{DD} = 2.7V to 5.5V	4			ns
t_{11}	SCLK falling edge to $\overline{LDAC}$ falling edge for asynchronous LDAC update mode	AV_{DD} = 2.7V to 5.5V	40			ns
t_{12}	$\overline{LDAC}$ pulse width LOW time	AV_{DD} = 2.7V to 5.5V	80			ns
t_{13}	$\overline{LDAC}$ falling edge to SCLK falling edge for synchronous LDAC update mode	AV_{DD} = 2.7V to 5.5V	4 × t_1			ns
t_{14}	32nd SCLK falling edge to $\overline{LDAC}$ rising edge	AV_{DD} = 2.7V to 5.5V	40			ns
t_{15}	$\overline{CLR}$ pulse width LOW time	AV_{DD} = 2.7V to 5.5V	80			ns



(1) Asynchronous LDAC update mode. For more information and details, see the *LDAC Functionality* section.

(2) Synchronous LDAC update mode. For more information and details, see the *LDAC Functionality* section.

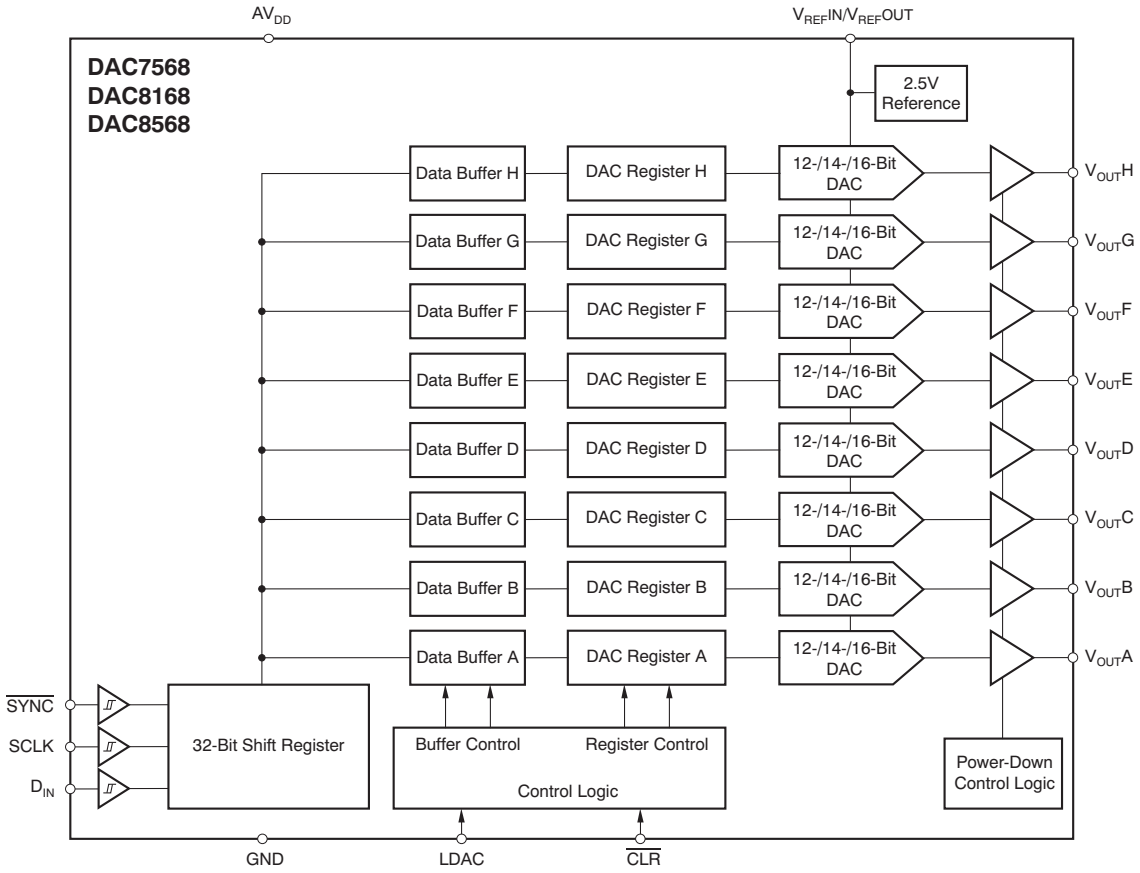
9 Detailed Description

9.1 Functional Block Diagram



9.2 Feature Description

9.2.1 Digital-to-Analog Converter (DAC)

The DAC7568, DAC8168, and DAC8568 architecture consists of eight string DACs each followed by an output buffer amplifier. The devices include an internal 2.5V reference with 2ppm/°C temperature drift performance, and offer either 5V or 2.5V full scale output voltage. Figure 120 shows a principal block diagram of the DAC architecture.

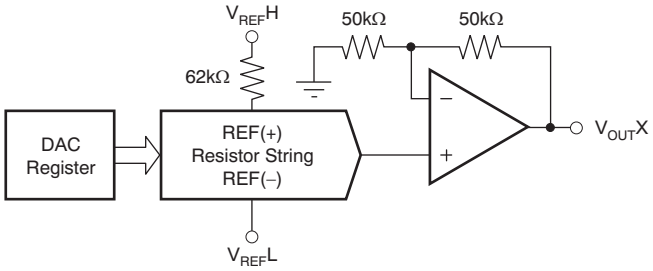


Figure 120. Device Architecture

The input coding to the DAC7568, DAC8168, and DAC8568 is straight binary, so the ideal output voltage is given by Equation 1:

Feature Description (continued)

$$V_{OUT} = \left(\frac{D_{IN}}{2^n} \right) \times V_{REF} \times \text{Gain} \quad (1)$$

Where:

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register. It can range from 0 to 4095 for DAC7568 (12 bit), 0 to 16,383 for DAC8168 (14 bit), and 0 to 65535 for DAC8568 (16 bit).

n = resolution in bits; either 12 (DAC7568), 14 (DAC8168) or 16 (DAC8568)

Gain = 1 for A/B grades or 2 for C/D grades.

9.2.2 Resistor String

The resistor string section is shown in Figure 121. It is simply a string of resistors, each of value *R*. The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier. It is monotonic because it is a string of resistors.

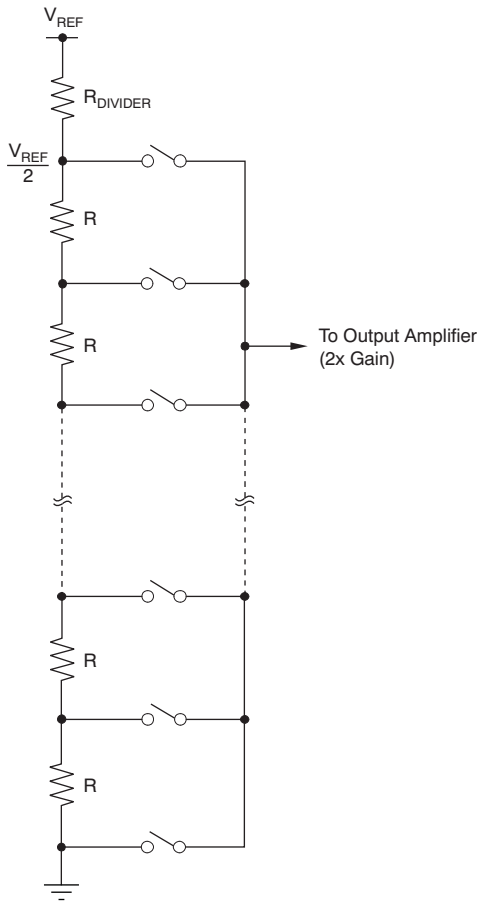

Figure 121. Resistor String

9.2.3 Output Amplifier

The output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving a maximum output range of 0V to AV_{DD}. It is capable of driving a load of 2kΩ in parallel with 3000pF to GND. The source and sink capabilities of the output amplifier can be seen in the *Typical Characteristics*. The typical slew rate is 0.75V/µs, with a typical full-scale settling time of 5µs with the output unloaded.

Feature Description (continued)

9.2.4 Internal Reference

The DAC7568, DAC8168, and DAC8568 include a 2.5V internal reference that is disabled by default. The internal reference is externally available at the $V_{REF}IN/V_{REF}OUT$ pin. A minimum 100nF capacitor is recommended between the reference output and GND for noise filtering.

The internal reference of the DAC7568, DAC8168, and DAC8568 is a bipolar, transistor-based, precision bandgap voltage reference. Figure 122 shows the basic bandgap topology. Transistors Q_1 and Q_2 are biased such that the current density of Q_1 is greater than that of Q_2. The difference of the two base-emitter voltages ($V_{BE1} - V_{BE2}$) has a positive temperature coefficient and is forced across resistor R_1. This voltage is gained up and added to the base-emitter voltage of Q_2, which has a negative temperature coefficient. The resulting output voltage is virtually independent of temperature. The short-circuit current is limited by design to approximately 100mA.

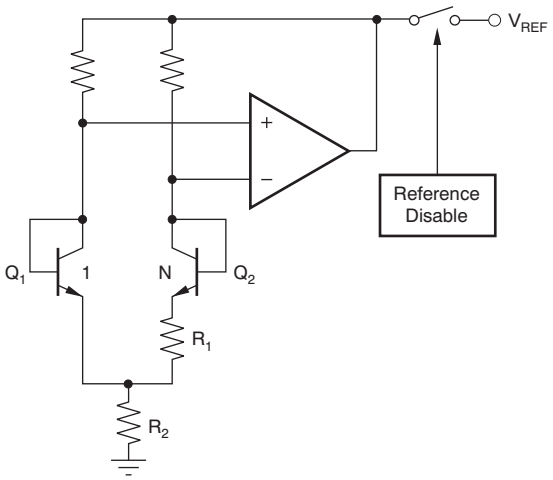

Figure 122. Bandgap Reference Simplified Schematic

Refer to *Enable/Disable Internal Reference* section for information on enabling and disabling the internal reference.

9.2.5 Serial Interface

The DAC7568, DAC8168, and DAC8568 have a 3-wire serial interface ($\overline{SYNC}$, SCLK, and D_{IN}; see the *Pin Configurations*) compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See the Serial Write Operation timing diagram (Figure 1) for an example of a typical write sequence.

The DAC7568, DAC8168, and DAC8568 input shift register is 32-bits wide, consisting of four prefix bits (DB31 to DB28), four control bits (DB27 to DB24), 16 data bits (DB23 to DB4), and four feature bits. The 16 data bits comprise the 16-, 14-, or 12-bit input code. When writing to the DAC register (data transfer), bits DB0 to DB3 (for 16-bit operation), DB0 to DB5 (for 14-bit operation), and DB0 to DB7 (for 12-bit operation) are ignored by the DAC and should be treated as *don't care* bits (see Table 1 to Table 3). All 32 bits of data are loaded into the DAC under the control of the serial clock input, SCLK.

DB31 (MSB) is the first bit that is loaded into the DAC shift register and must be always set to '0'. It is followed by the rest of the 32-bit word pattern, left-aligned. This configuration means that the first 32 bits of data are latched into the shift register and any further clocking of data is ignored. When the DAC registers are being written to, the DAC7568, DAC8168, and DAC8568 receive all 32 bits of data, ignore DB31 to DB28, and decode the second set of four bits (DB27 to DB24) in order to determine the DAC operating/control mode (see). Bits DB23 to DB20 are used to address selected DAC channels. The next 16/14/12 bits of data that follow are decoded by the DAC to determine the equivalent analog output. The last four data bits (DB0 to DB3 for DAC8568), last data six bits (DB0 to DB5 for DAC8168), or last eight data bits (DB0 to DB7 for DAC7568) are ignored in this case. For more details on these and other commands (such as write to LDAC register, power down DACs, etc.), see Table 4.

Feature Description (continued)

The data format is straight binary with all '0's corresponding to 0V output and all '1's corresponding to full-scale output. For all documentation purposes, the data format and representation used here is a true 16-bit pattern (that is, FFFFh for data word for full-scale) that the DAC7568, DAC8168, and DAC8568 require.

The write sequence begins by bringing the $\overline{\text{SYNC}}$ line low. Data from the D_{IN} line are clocked into the 32-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 50MHz, making the DAC7568, DAC8168, and DAC8568 compatible with high-speed DSPs. On the 32nd falling edge of the serial clock, the last data bit is clocked into the shift register and the shift register locks. Further clocking does not change the shift register data. After receiving the 32nd falling clock edge, the DAC7568, DAC8168, and DAC8568 decode the four control bits and four address bits and 16/14/12 data bits to perform the required function, without waiting for a $\overline{\text{SYNC}}$ rising edge. A new write sequence starts at the next falling edge of $\overline{\text{SYNC}}$. A rising edge of $\overline{\text{SYNC}}$ before the 31st-bit sequence is complete resets the SPI interface; no data transfer occurs. After the 32nd falling edge of SCLK is received, the $\overline{\text{SYNC}}$ line may be kept low or brought high. In either case, the minimum delay time from the 32nd falling SCLK edge to the next falling $\overline{\text{SYNC}}$ edge must be met in order to properly begin the next cycle; see the Serial Write Operation timing diagram (Figure 1). To assure the lowest power consumption of the device, care should be taken that the levels are as close to each rail as possible. Refer to the 5.5V, 3.6V, and 2.7V Typical Characteristics sections for the *Power-Supply Current vs Logic Input Voltage* graphs (Figure 43, Figure 44, Figure 70, Figure 72, Figure 102, and Figure 103).

Feature Description (continued)

9.2.6 Input Shift Register

The input shift register (SR) of the DAC7568, DAC8168, and DAC8568 is 32 bits wide (as shown in Table 1, Table 2, and Table 3, respectively), and consists of four Prefix bits (DB31 to DB28), four control bits (DB27 to DB24), 16 data bits (DB23 to DB4), and four additional feature bits. The 16 data bits comprise the 16-, 14-, or 12-bit input code.

The DAC7568, DAC8168, and DAC8568 support a number of different load commands. The load commands are summarized in Table 4.

9.2.7 SYNC Interrupt

In a normal write sequence, the SYNC line stays low for at least 32 falling edges of SCLK and the addressed DAC register updates on the 32nd falling edge. However, if SYNC is brought high before the 31st falling edge, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (as shown in Figure 123).

9.2.8 Power-on Reset to Zero Scale or Midscale

The DAC7568, DAC8168, and DAC8568 contain a power-on reset circuit that controls the output voltage during power-up. For device grades A and C on power-up, all DAC registers are filled with zeros and the output voltages of all DAC channels are set to zero scale. For device grades B and D all DAC registers are set to have all DAC channels power up in midscale. All DAC channels remain that way until a valid write sequence and load command are made to the respective DAC channel. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. No device pin should be brought high before power is applied to the device. The internal reference is powered off / down by default and remains that way until a valid reference-change command is executed.

9.2.9 Clear Code Register and CLR Pin

The DAC7568, DAC8168, and DAC8568 contain a clear code register. The clear code register can be accessed via the serial peripheral interface (SPI) and is user-configurable. Bringing the CLR pin low clears the content of all DAC registers and all DAC buffers, and replaces the code with the code determined by the clear code register. The clear code register can be written to by applying the commands showed in Table 5. The control bits must be set as follows to access the clear code register that is programmed via the feature bits, F0 and F1: C3 = '0', C2 = '1', C1 = '0', and C0 = '1'. The default setting of the clear code register sets the output of all DAC channels to 0V when CLR pin is brought low. The CLR pin is falling-edge triggered; therefore, the device exits clear code mode on the 32nd falling edge of the next write sequence. If CLR pin is brought low during a write sequence, this write sequence is aborted and the DAC registers and DAC buffers are cleared as described previously.

When performing a software reset of the device, the clear code register is set back to its default mode (DB1 = DB0 = '0'). Setting the clear code register to DB1 = DB0 = '1' ignores any activity on the external CLR pin.

9.2.10 Software Reset Function

The DAC7568, DAC8168, and DAC8568 contain a software reset feature. If the software reset feature is executed, all registers inside the device are reset to default settings; that is, all DAC channels are reset to the power-on reset code (power on reset to zero scale for grades A and C; power on reset to midscale for grades B and D).

Table 5. Clear Code Register

9.2.11 Operating Examples: DAC7568/DAC8168/DAC8568

For the following examples X = *don't care*; value can be either '0' or '1'.

Example 1: Write to Data Buffer A, B, G, H; Load DAC A, B, G, H Simultaneously

1st: Write to Data Buffer A:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	0	0	0	0	0	0	DATA							X	X	X	X

2nd: Write to Data Buffer B:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	0	0	0	0	0	1	DATA							X	X	X	X

3rd: Write to Data Buffer G:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	0	0	0	1	1	0	DATA							X	X	X	X

4th: Write to Data Buffer H and Simultaneously Update all DACs:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	1	0	0	1	1	1	DATA							X	X	X	X

The DAC A, DAC B, DAC G, and DAC H analog outputs simultaneously settle to the specified values upon completion of the 4th write sequence. (The DAC voltages update simultaneously after the 32nd SCLK falling edge of the fourth write cycle).

Example 2: Load New Data to DAC C, D, E, F Sequentially

1st: Write to Data Buffer C and Load DAC C: DAC C Output Settles to Specified Value Upon Completion:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	1	1	0	0	1	0	DATA							X	X	X	X

2nd: Write to Data Buffer D and Load DAC D: DAC D Output Settles to Specified Value Upon Completion:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	1	1	0	0	1	1	DATA							X	X	X	X

3rd: Write to Data Buffer E and Load DAC E: DAC E Output Settles to Specified Value Upon Completion:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	1	1	0	1	0	0	DATA							X	X	X	X

4th: Write to Data Buffer F and Load DAC F: DAC F Output Settles to Specified Value Upon Completion:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	1	1	0	1	0	1	DATA							X	X	X	X

After completion of each write cycle, the DAC analog output settles to the voltage specified.

Example 3: Power-Down DAC A, DAC B and DAC H to 1kΩ and Power-Down DAC C, DAC D, and DAC F to 100kΩ

1st: Write Power-Down Command to DAC Channel A and DAC Channel B: DAC A and DAC B to 1kΩ.

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	1	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	1	1

2nd: Write Power-Down Command to DAC Channel H: DAC H to 1kΩ.

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	1	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0

3rd: Write Power-Down Command to DAC Channel C and DAC Channel D: DAC C and DAC D to 100kΩ.

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0

4th: Write Power-Down Command to DAC Channel F: DAC F to 100kΩ.

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0	0

The DAC A, DAC B, DAC C, DAC D, DAC F, and DAC H analog outputs power-down to each respective specified mode.

Example 4: Power-Down All Channels Simultaneously while Reference is Always Powered Up

1st: Write Sequence for Enabling the DAC7568, DAC8168, and DAC8568 Internal Reference All the Time:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19	DB18	DB17	DB16-DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16	D15	D14	D13-D4	D3	D2	D1	F3	F2	F1	F0
0	X	1	0	0	1	X	X	X	X	1	0	1	X	X	X	X	X	X	X	X

2nd: Write Sequence to Power-Down All DACs to High-Impedance:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	1	0	0	X	X	X	X	X	1	1	1	1	1	1	1	1	1	1

The DAC A, DAC B, DAC C, DAC D, DAC E, DAC F, DAC G, and DAC H analog outputs simultaneously power-down to high-impedance upon completion of the first and second write sequences, respectively.

Example 5: Write a Specific Value to All DACs while Reference is Always Powered Down

1st: Write Sequence for Disabling the DAC7568, DAC8168, and DAC8568 Internal Reference All the Time (after this sequence, these devices require an external reference source to function):

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19	DB18	DB17	DB16-DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16	D15	D14	D13-D4	D3	D2	D1	F3	F2	F1	F0
0	X	1	0	0	1	X	X	X	X	1	1	0	X	X	X	X	X	X	X	X

2nd: Write Sequence to Write Specified Data to All DACs:

DB31	DB30-DB28	DB27	DB26	DB25	DB24	DB23	DB22	DB21	DB20	DB19-DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	Don't Care	C3	C2	C1	C0	A3	A2	A1	A0	D16-D7	D6	D5	D4	D3	D2	D1	F3	F2	F1	F0
0	X	0	0	1	1	1	1	1	1	DATA							X	X	X	X

The DAC A, DAC B, DAC C, DAC D, DAC E, DAC F, DAC G, and DAC H analog outputs simultaneously settle to the specified values upon completion of the second write sequence. (The DAC voltages update simultaneously after the 32nd SCLK falling edge of the second write cycle). Reference is always powered-down (External reference must be used for proper operation).

9.3 Device Functional Modes

9.3.1 Enable/Disable Internal Reference

The internal reference in the DAC7568, DAC8168, and DAC8568 is disabled by default for debugging, evaluation purposes, or when using an external reference. The internal reference can be powered up and powered down using a serial command that requires a 32-bit write sequence (see the *Serial Interface* section), as shown in Table 7 and Table 9. During the time that the internal reference is disabled, the DAC functions normally using an external reference. At this point, the internal reference is disconnected from the $V_{REF}IN/V_{REF}OUT$ pin (3-state output). Do not attempt to drive the $V_{REF}IN/V_{REF}OUT$ pin externally and internally at the same time indefinitely.

There are two modes that allow communication with the internal reference: Static and Flexible. In Flexible mode, DB19 must be set to '1'.

9.3.1.1 Static Mode

(see Table 7 and Table 8)

Enabling Internal Reference:

To enable the internal reference, write the 32-bit serial command shown in Table 7. When performing a power cycle to reset the device, the internal reference is switched off (default mode). In the default mode, the internal reference is powered down until a valid write sequence is applied to power up the internal reference. If the internal reference is powered up, it automatically powers down when all DACs power down in any of the power-down modes (see the *Power Down Modes* section). The internal reference automatically powers up when any DAC is powered up.

Disabling Internal Reference:

To disable the internal reference, write the 32-bit serial command shown in Table 8. When performing a power cycle to reset the device, the internal reference is put back into its default mode and switched off (default mode).

Table 7. Write Sequence for Enabling Internal Reference (Static Mode) (Internal Reference Powered On—08000001h)

DB31				DB27				DB23				DB19														DB4			DB0

Table 8. Write Sequence for Disabling Internal Reference (Static Mode) (Internal Reference Powered On—08000000h)

DB31				DB27				DB23				DB19														DB4			DB0
0	X	X	X	C3	C2	C1	C0	A3	A2	A1	A0	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	F3	F2	F1	F0
0	X	X	X	1	0	0	0	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	0
|-- Prefix Bits --|			|- Control Bits -|			| Address Bits |			|---------- Data Bits ----------|															| Feature Bits |			

9.3.1.2 Flexible Mode

(see Table 9, Table 10, and Table 11)

Enabling Internal Reference:

Method 1) To enable the internal reference, write the 32-bit serial command shown in Table 9. When performing a power cycle to reset the device, the internal reference is switched off (default mode). In the default mode, the internal reference is powered down until a valid write sequence is applied to power up the internal reference. If the internal reference is powered up, it automatically powers down when all DACs power down in any of the power-down modes (see the *Power Down Modes* section). The internal reference powers up automatically when any DAC is powered up.

Device Functional Modes (continued)

(see Table 9, Table 10, and Table 11)

Method 2) To always enable the internal reference, write the 32-bit serial command shown in Table 10. When the internal reference is always enabled, any power-down command to the DAC channels does not change the internal reference operating mode. When performing a power cycle to reset the device, the internal reference is switched off (default mode). In the default mode, the internal reference is powered down until a valid write sequence is applied to power up the internal reference. When the internal reference is powered up, it remains powered up, regardless of the state of the DACs.

Disabling Internal Reference:

To disable the internal reference, write the 32-bit serial command shown in Table 11. When performing a power cycle to reset the device, the internal reference is switched off (default mode).

When the internal reference is operated in Flexible mode, Static mode is disabled and does not work. To switch from Flexible mode to Static mode, use the command shown in Table 12.

9.3.2 $\overline{\text{LDAC}}$ Functionality

The DAC7568, DAC8168, and DAC8568 offer both a software and hardware simultaneous update and control function. The DAC double-buffered architecture has been designed so that new data can be entered for each DAC without disturbing the analog outputs.

DAC7568, DAC8168, and DAC8568 data updates can be performed either in *synchronous* or in *asynchronous* mode.

Device Functional Modes (continued)

In *synchronous* mode, data are updated with the falling edge of the 32nd SCLK cycle, which follows a falling edge of $\overline{\text{SYNC}}$. For such *synchronous* updates, the $\overline{\text{LDAC}}$ pin is not required and it must be connected to GND permanently.

In *asynchronous* mode, the $\overline{\text{LDAC}}$ pin is used as a negative edge triggered timing signal for simultaneous DAC updates. Multiple single-channel updates can be done in order to set different channel buffers to desired values and then make a falling edge on $\overline{\text{LDAC}}$ pin to simultaneously update the DAC output registers. Data buffers of all channels must be loaded with desired data before an $\overline{\text{LDAC}}$ falling edge. After a high-to-low $\overline{\text{LDAC}}$ transition, all DACs are simultaneously updated with the last contents of the corresponding data buffers. If the content of a data buffer is not changed, the corresponding DAC output remains unchanged after the $\overline{\text{LDAC}}$ pin is triggered.

Alternatively, all DAC outputs can be updated simultaneously using the built-in software function of $\overline{\text{LDAC}}$. The LDAC register offers additional flexibility and control by allowing the selection of which DAC channel(s) should be updated simultaneously when the $\overline{\text{LDAC}}$ pin is being brought low. The LDAC register is loaded with an 8-bit word (DB0 to DB7) using control bits C3, C2, C1, and C0 (see). The default value for each bit, and therefore for each DAC channel, is zero. The external $\overline{\text{LDAC}}$ pin operates in normal mode. If the LDAC register bit is set to '1', it overrides the $\overline{\text{LDAC}}$ pin (the $\overline{\text{LDAC}}$ pin is internally tied low for that particular DAC channel) and this DAC channel updates synchronously after the falling edge of the 32nd SCLK cycle. However, if the LDAC register bit is set to '0', the DAC channel is controlled by the $\overline{\text{LDAC}}$ pin.

The combination of software and hardware simultaneous update functions is particularly useful in applications when updating only selective DAC channels simultaneously, while keeping the other channels unaffected and updating those channels synchronously; see for more information.

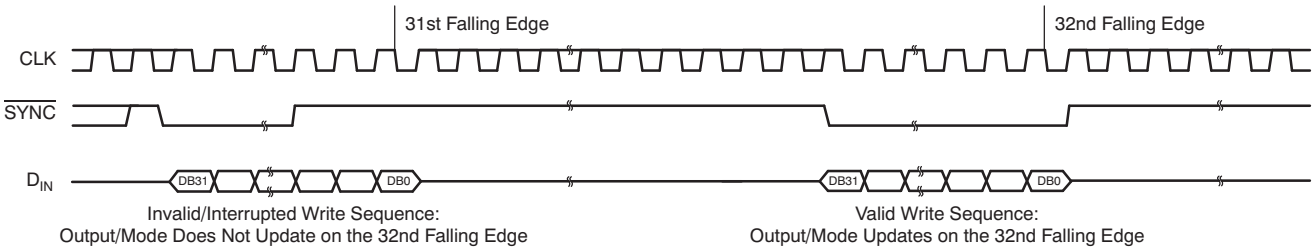

Figure 123. $\overline{\text{SYNC}}$ Interrupt Facility

9.3.3 Power-Down Modes

The DAC7568, DAC8168, and DAC8568 have two separate sets of power-down commands. One set is for the DAC channels and the other set is for the internal reference. For more information on powering down the reference, see the *Enable/Disable Internal Reference* section.

9.3.3.1 DAC Power-Down Commands

The DAC7568, DAC8168, and DAC8568 use four modes of operation. These modes are accessed by setting control bits C3, C2, C1, and C0, and power-down register bits DB8 and DB9. The control bits must be set to '0100'. Once the control bits are set correctly, the four different power down modes are software programmable by setting bits DB8 and DB9 in the control register. and Table 13 shows how to control the operating mode with data bits PD0 (DB8), and PD1 (DB9).

Table 13. DAC Operating Modes

PD1 (DB9)	PD0 (DB8)	DAC OPERATING MODES
0	0	Power up selected DACs
0	1	Power down selected DACs 1kΩ to GND
1	0	Power down selected DACs 100kΩ to GND
1	1	Power down selected DACs High-Z to GND

The DAC7568, DAC8168, and DAC8568 treat the power-down condition as data; all the operational modes are still valid for power-down. It is possible to broadcast a power-down condition to all the DAC8568, DAC8168, DAC7568s in a system. It is also possible to power-down a channel and update data on other channels. Furthermore, it is possible to write to the DAC register/buffer of the DAC channel that is powered down. When the DAC channel is then powered up, it will power up to this new value (see the *Operating Examples* section).

When both the PD0 and PD1 bits are set to '0', the device works normally with its typical current consumption of 1.25mA at 5.5V. The reference current is included with the operation of all eight DACs. However, for the three power-down modes, the supply current falls to 0.18μA at 5.5V (0.10μA at 3.6V). Not only does the supply current fall, but the output stage also switches internally from the output of the amplifier to a resistor network of known values.

The advantage of this switching is that the output impedance of the device is known while it is in power-down mode. As described in Table 13, there are three different power-down options. V_{OUT} can be connected internally to GND through a 1kΩ resistor, a 100kΩ resistor, or open circuited (High-Z). The output stage is shown in Figure 124. In other words, DB27, DB26, DB25, and DB24 = '0100' and DB9 and DB8 = '11' represent a power-down condition with High-Z output impedance for a selected channel. DB9 and DB8 = '01' represents a power-down condition with 1kΩ output impedance, and '10' represents a power-down condition with 100kΩ output impedance.

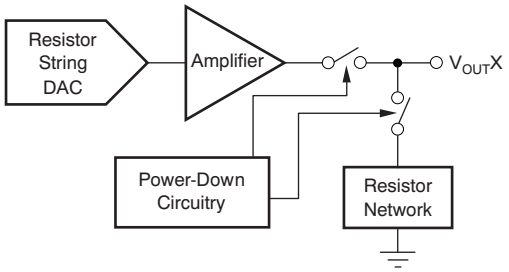

Figure 124. Output Stage During Power-Down

All analog channel circuits are shut down when the power-down mode is exercised. However, the contents of the DAC register are unaffected when in power down. By setting both bits, DB8 and DB9, to different values, any combination of DAC channels can be powered down or powered up. If a DAC channel is being powered up from a previously power down situation, this DAC channel powers up to the value in its DAC register. The time required to exit power-down is typically 2.5μs for AV_{DD} = 5V, and 4μs for AV_{DD} = 3V. See the *Typical Characteristics* section for more information.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

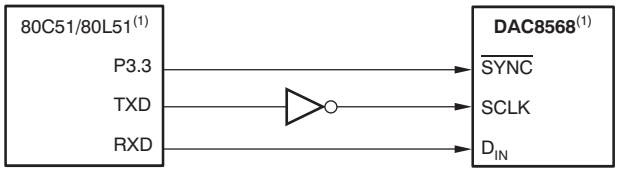
10.1 Application Information

Typical applications are discussed in the following section.

10.2 Typical Applications - Microprocessor Interfacing

10.2.1 DAC7568/DAC8168/DAC8568 to an 8051 Interface

Figure 125 shows a serial interface between the DAC7568, DAC8168, and DAC8568 and a typical 8051-type microcontroller. The setup for the interface is as follows: TXD of the 8051 drives SCLK of the DAC7568, DAC8168, or DAC8568, while RXD drives the serial data line of the device. The $\overline{\text{SYNC}}$ signal is derived from a bit-programmable pin on the port of the 8051; in this case, port line P3.3 is used. When data are to be transmitted to the DAC7568, DAC8168, and DAC8568, P3.3 is taken low. The 8051 transmits data in 8-bit bytes; thus, only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P3.3 is left low after the first eight bits are transmitted; then, a second write cycle is initiated to transmit the second byte of data. P3.3 is taken high following the completion of the third write cycle. The 8051 outputs the serial data in a format that has the LSB first. The DAC7568, DAC8168, and DAC8568 require the data with the MSB as the first bit received. Therefore, the 8051 transmit routine must take this requirement into account, and *mirror* the data as needed.



NOTE: (1) Also applies to DAC7568 and DAC8168. Additional pins omitted for clarity.

Figure 125. DAC7568/DAC8168/DAC8568 to 80C51/80L51 Interface

10.2.1.1 Detailed Design Procedure

10.2.1.1.1 Internal Reference

The internal reference of the DAC7568, DAC8168, and DAC8568 does not require an external load capacitor for stability because it is stable with any capacitive load. However, for improved noise performance, an external load capacitor of 150nF or larger connected to the $V_{REF}H/V_{REF}OUT$ output is recommended. Figure 126 shows the typical connections required for operation of the DAC7568, DAC8168, and DAC8568 internal reference. A supply bypass capacitor at the AV_{DD} input is also recommended.

Typical Applications - Microprocessor Interfacing (continued)

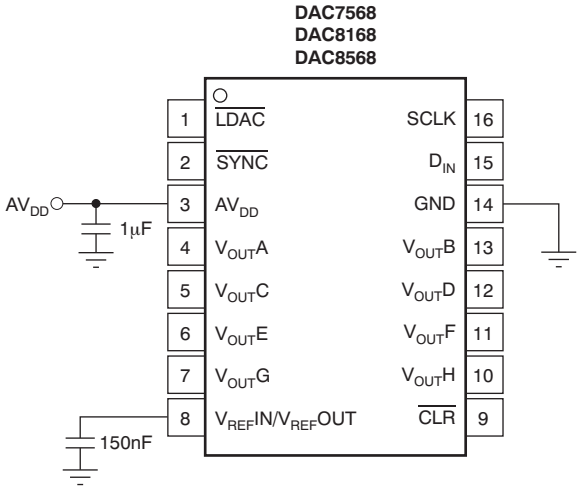


Figure 126. Typical Connections for Operating the DAC7568/DAC8168/DAC8568 Internal Reference (16-Pin Version Shown)

10.2.1.1.1.1 Supply Voltage

The internal reference features an extremely low dropout voltage. It can be operated with a supply of only 5mV above the reference output voltage in an unloaded condition. For loaded conditions, refer to the *Load Regulation* section. The stability of the internal reference with variations in supply voltage (line regulation, dc PSRR) is also exceptional. Within the specified supply voltage range of 2.7V to 5.5V, the variation at $V_{REF}H/V_{REF}OUT$ is less than 10µV/V; see the *Typical Characteristics* section.

10.2.1.1.1.2 Temperature Drift

The internal reference is designed to exhibit minimal drift error, defined as the change in reference output voltage over varying temperature. The drift is calculated using the *box* method described by Equation 2:

$$\text{Drift Error} = \left(\frac{V_{REF\_MAX} - V_{REF\_MIN}}{V_{REF} \times T_{RANGE}} \right) \times 10^6 \text{ (ppm/°C)} \quad (2)$$

Where:

V_{REF_MAX} = maximum reference voltage observed within temperature range T_{RANGE}.
V_{REF_MIN} = minimum reference voltage observed within temperature range T_{RANGE}.
V_{REF} = 2.5V, target value for reference output voltage.

The internal reference (grade C only) features an exceptional typical drift coefficient of 2ppm/°C from –40°C to +125°C. Characterizing a large number of units, a maximum drift coefficient of 5ppm/°C (grade C only) is observed. Temperature drift results are summarized in the *Typical Characteristics* section.

10.2.1.1.1.3 Noise Performance

Typical 0.1Hz to 10Hz voltage noise can be seen in Figure 9, *Internal Reference Noise*. Additional filtering can be used to improve output noise levels, although care should be taken to ensure the output impedance does not degrade the ac performance. The output noise spectrum at $V_{REF}H/V_{REF}OUT$ without any external components is depicted in Figure 8, *Internal Reference Noise Density vs Frequency*. A second noise density spectrum is also shown in Figure 8. This spectrum was obtained using a 4.8µF load capacitor at $V_{REF}H/V_{REF}OUT$ for noise filtering. Internal reference noise impacts the DAC output noise; see the *DAC Noise Performance* section for more details.

Typical Applications - Microprocessor Interfacing (continued)

10.2.1.1.1.4 Load Regulation

Load regulation is defined as the change in reference output voltage as a result of changes in load current. The load regulation of the internal reference is measured using force and sense contacts as shown in Figure 127. The force and sense lines reduce the impact of contact and trace resistance, resulting in accurate measurement of the load regulation contributed solely by the internal reference. Measurement results are summarized in the *Typical Characteristics* section. Force and sense lines should be used for applications that require improved load regulation.

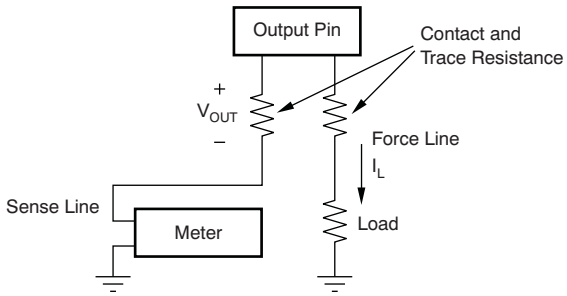

Figure 127. Accurate Load Regulation of the DAC7568/DAC8168/DAC8568 Internal Reference

10.2.1.1.1.5 Long-Term Stability

Long-term stability/aging refers to the change of the output voltage of a reference over a period of months or years. This effect lessens as time progresses (see Figure 7, the typical long-term stability curve). The typical drift value for the internal reference is 50ppm from 0 hours to 1900 hours. This parameter is characterized by powering-up 20 units and measuring them at regular intervals for a period of 1900 hours.

10.2.1.1.1.6 Thermal Hysteresis

Thermal hysteresis for a reference is defined as the change in output voltage after operating the device at +25°C, cycling the device through the operating temperature range, and returning to +25°C. Hysteresis is expressed by Equation 3:

$$V_{HYST} = \left(\frac{|V_{REF\_PRE} - V_{REF\_POST}|}{V_{REF\_NOM}} \right) \times 10^6 \text{ (ppm/°C)} \quad (3)$$

Where:

V_{HYST} = thermal hysteresis.

V_{REF_PRE} = output voltage measured at +25°C pre-temperature cycling.

V_{REF_POST} = output voltage measured after the device cycles through the temperature range of –40°C to +125°C, and returns to +25°C.

10.2.1.1.2 DAC Noise Performance

Typical noise performance for the DAC7568, DAC8168, and DAC8568 with the internal reference enabled is shown in Figure 66 to Figure 67. Output noise spectral density at the V_{OUT} pin versus frequency is depicted in Figure 66 for full-scale, midscale, and zero-scale input codes. The typical noise density for midscale code is 120nV/$\sqrt{Hz}$ at 1kHz and 100nV/$\sqrt{Hz}$ at 1MHz. High-frequency noise can be improved by filtering the reference noise. Integrated output noise between 0.1Hz and 10Hz is close to 6μV_{PP} (midscale), as shown in Figure 67.

10.2.1.1.3 Bipolar Operation Using The DAC7568/DAC8168/DAC8568

The DAC7568, DAC8168, and DAC8568 are designed for single-supply operation, but a bipolar output range is also possible using the circuit in either Figure 128 or Figure 129. The circuit shown gives an output voltage range of ±V_{REF}. Rail-to-rail operation at the amplifier output is achievable using an OPA703 as the output amplifier.

The output voltage for any input code can be calculated with Equation 4:

Typical Applications - Microprocessor Interfacing (continued)

$$V_{OUT} = \left(V_{REF} \times Gain \times \left(\frac{D_{IN}}{2^n} \right) \times \left(\frac{R_1 + R_2}{R_1} \right) - V_{REF} \times \left(\frac{R_2}{R_1} \right) \right) \quad (4)$$

Where:

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register. It can range from 0 to 4095 for DAC7568 (12 bit), 0 to 16,383 for DAC8168 (14 bit), and 0 to 65535 for DAC8568 (16 bit).

n = resolution in bits; either 12 (DAC7568), 14 (DAC8168) or 16 (DAC8568)

Gain = 1 for A/B grades or 2 for C/D grades.

With $V_{REF}IN/V_{REF}OUT$ = 5V, $R_1 = R_2$ = 10kΩ, for grades A and B.

$$V_{OUT} = \left(\frac{10 \times D_{IN}}{2^n} \right) - 5V \quad (5)$$

This result has an output voltage range of ±5V with 0000h corresponding to a –5V output and FFFFh corresponding to a +5V output for the 16-bit DAC8568, as shown in Figure 128. Similarly, using the internal reference, a ±2.5V output voltage range can be achieved, as Figure 129 shows.

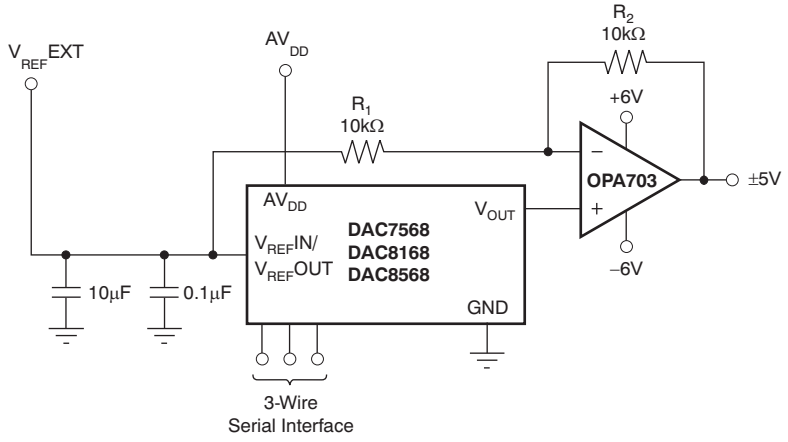

Figure 128. Bipolar Output Range Using External Reference at 5V

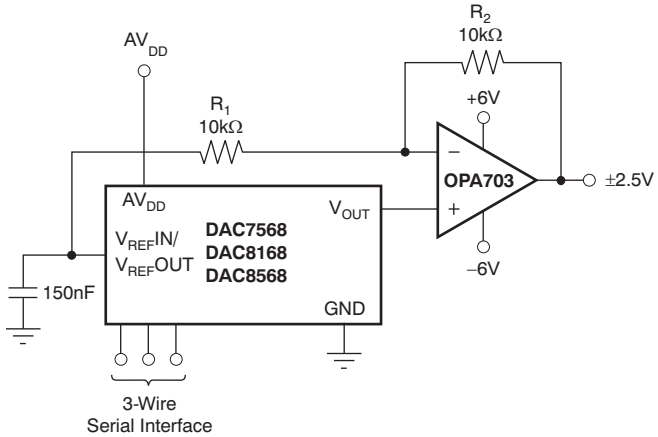

Figure 129. Bipolar Output Range Using Internal Reference

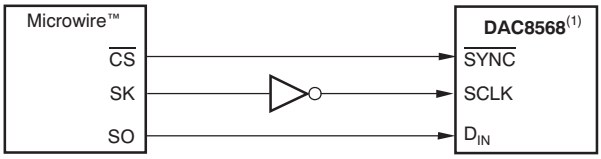
10.2.2 DAC7568/DAC8168/DAC8568 to Microwire Interface

Figure 130 shows an interface between the DAC7568, DAC8168, and DAC8568 and any Microwire-compatible device. Serial data are shifted out on the falling edge of the serial clock and are clocked into the DAC7568, DAC8168, and DAC8568 on the rising edge of the SK signal.

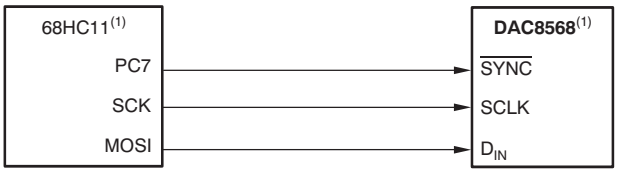


NOTE: (1) Also applies to DAC7568 and DAC8168. Additional pins omitted for clarity.

Figure 130. DAC7568/DAC8168/DAC8568 to Microwire Interface

10.2.3 DAC7568/DAC8168/DAC8568 to 68HC11 Interface

Figure 131 shows a serial interface between the DAC7568/DAC8168/DAC8568 and the 68HC11 microcontroller. SCK of the 68HC11 drives the SCLK of the DAC7568, DAC8168, and DAC8568, while the MOSI output drives the serial data line of the DAC. The SYNC signal derives from a port line (PC7), similar to the 8051 diagram.



NOTE: (1) Also applies to DAC7568 and DAC8168. Additional pins omitted for clarity.

Figure 131. DAC7568/DAC8168/DAC8568 to 68HC11 Interface

The 68HC11 should be configured so that its CPOL bit is '0' and its CPHA bit is '1'. This configuration causes data appearing on the MOSI output to be valid on the falling edge of SCK. When data are being transmitted to the DAC, the SYNC line is held low (PC7). Serial data from the 68HC11 are transmitted in 8-bit bytes with only eight falling clock edges occurring in the transmit cycle. (Data are transmitted MSB first.) In order to load data to the DAC7568, DAC8168, and DAC8568, PC7 is left low after the first eight bits are transferred; then, a second and third serial write operation are performed to the DAC. PC7 is taken high at the end of this procedure.

11 Layout

11.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies.

The DAC7568, DAC8168, and DAC8568 offer single-supply operation, and are often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output.

As a result of the single ground pin of the DAC7568, DAC8168, and DAC8568, all return currents (including digital and analog return currents for the DAC) must flow through a single point. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power-entry point of the system.

The power applied to AV_{DD} should be well-regulated and low noise. Switching power supplies and dc/dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as their internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output.

As with the GND connection, AV_{DD} should be connected to a power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. In addition, a 1μF to 10μF capacitor and 0.1μF bypass capacitor are strongly recommended. In some situations, additional bypassing may be required, such as a 100μF electrolytic capacitor or even a *Pi* filter made up of inductors and capacitors—all designed to essentially low-pass filter the supply and remove the high-frequency noise.

12 デバイスおよびドキュメントのサポート

12.1 デバイス・サポート

12.1.1 デバイスの項目表記

製品のデータシートに記載されている多くの種類の仕様がますます複雑化してきたため、デジタル/アナログ・コンバータに関する仕様の一部をこのセクションに要約します。

12.1.1.1 静的特性

静的特性のパラメータは、微分非直線性(DNL)や積分非直線性(INL)などの仕様です。これらはDC仕様であり、DACの精度に関する情報を提供します。これらの仕様は、信号がゆっくりと変化し、高い精度が要求されるアプリケーションで最も重要になります。

12.1.1.1.1 分解能

一般に、DACの分解能はさまざまな方法で表現されます。IEC 60748-4などの仕様では、数値分解能、アナログ分解能、および相対分解能が使用されます。数値分解能は、転送特性の全ステップ数を表現するために必要な、選択された記数法の桁数として定義されます。ここでステップとは、デジタル入力コードおよびそれに対応する離散アナログ出力値の両方を表します。データシートに記載される最も一般的な分解能の定義は、ビットで表された数値分解能です。

12.1.1.1.2 最下位ビット(LSB)

最下位ビット(LSB)は、2進符号化における最小の値として定義されます。LSBの値は、フルスケール出力電圧を2^nで除算して計算できます。ここで*n*は、コンバータの分解能です。

12.1.1.1.3 最上位ビット(MSB)

最上位ビット(MSB)は、2進符号化における最大の値として定義されます。MSBの値は、フルスケール出力電圧を2で除算して計算できます。この値は、フルスケールの1/2です。

12.1.1.1.4 相対精度または積分非直線性(INL)

相対精度または積分非直線性(INL)は、実際の伝達関数と、理想的なDAC伝達関数の終点間を通過する直線との、最大偏差として定義されます。DNLはLSBを単位として測定されます。

12.1.1.1.5 微分非直線性(DNL)

微分非直線性(DNL)は、実際のLSBステップと理想的な1LSBステップとの最大偏差として定義されます。理想的には、任意の隣接する2つのデジタル・コードは、正確に1LSBだけ離れた出力アナログ電圧に対応します。DNLが1LSBよりも小さい場合、DACは単調特性を持つといいます。

12.1.1.1.6 フルスケール誤差

フルスケール誤差は、DACレジスタにフルスケール・コード(0xFFFF)が読み込まれたときの、理想的な出力電圧に対する実際のフルスケール出力電圧の偏差として定義されます。理想的には、出力はAV_{DD} - 1LSBとなります。フルスケール誤差は、フルスケール範囲に対するパーセンテージ(%FSR)で表されます。

12.1.1.1.7 オフセット誤差

オフセット誤差は、伝達関数の線形領域における実際の出力電圧と理想的な出力電圧の差として定義されます。この差は、2つのコード(コード485と64714)によって定義される直線を使用して計算されます。オフセット誤差は直線によって定義されるため、負の値と正の値のどちらになる可能性もあります。オフセット誤差はmV単位で測定されます。

12.1.1.1.8 ゼロ・コード誤差

ゼロ・コード誤差は、すべてのビットが0の値がDACレジスタに読み込まれたときのDAC出力電圧として定義されます。ゼロ・コード誤差は、実際の出力電圧と理想的な出力電圧(0V)との差を示すものです。単位はmVです。この誤差は、主に出力アンプのオフセットによって生じます。

12.1.1.1.9 ゲイン誤差

ゲイン誤差は、理想的な伝達関数からの実際のDAC伝達特性勾配の偏差として定義されます。ゲイン誤差は、フルスケール範囲に対するパーセンテージ(%FSR)で表されます。

デバイス・サポート (continued)

12.1.1.1.10 フルスケール誤差ドリフト

フルスケール誤差ドリフトは、温度が変化した場合のフルスケール誤差の変化として定義されます。フルスケール誤差ドリフトは、%FSR/℃単位で表されます。

12.1.1.1.11 オフセット誤差ドリフト

オフセット誤差ドリフトは、温度が変化した場合のオフセット誤差の変化として定義されます。オフセット誤差ドリフトは、μV/℃単位で表されます。

12.1.1.1.12 ゼロ・コード誤差ドリフト

ゼロ・コード誤差ドリフトは、温度が変化した場合のゼロ・コード誤差の変化として定義されます。ゼロ・コード誤差ドリフトは、μV/℃単位で表されます。

12.1.1.1.13 ゲイン温度係数

ゲイン温度係数は、温度が変化した場合のゲイン誤差の変化として定義されます。ゲイン温度係数は、FSR/℃のppm単位で表されます。

12.1.1.1.14 電源除去率(PSRR)

電源除去率(PSRR)は、DACのフルスケール出力時の、電源電圧の変化に対する出力電圧の変化の比として定義されます。デバイスのPSRRは、DACの出力が、電源電圧の変化にどれだけ影響を受けるかを示します。PSRRはデシベル(dB)単位で表されます。

12.1.1.1.15 単調性

単調性は、符号が変化しない勾配として定義されます。DACが単調性であれば、入力コード内の各増加(または減少)ステップに対して、出力は常に同じ方向に変化するか、または少なくとも一定に保持されます。

12.1.1.2 動的特性

動的特性のパラメータは、セトリング時間やスルー・レートなどの仕様であり、信号が高速で変化するアプリケーションや高周波信号が存在するアプリケーションで重要です。

12.1.1.2.1 スルー・レート

アンプや他の電子回路の出力スルー・レート(SR)は、すべての可能な入力信号に対する出力電圧の最大変化率として定義されます。

$$SR = \max\left(\left|\frac{\Delta V_{OUT}(t)}{\Delta t}\right|\right)$$

ここで、$\Delta V_{OUT}(t)$はアンプにより生成される出力で、時間*t*の関数です。

12.1.1.2.2 出力電圧のセトリング時間

セトリング時間は、入力の変化後に、DAC出力がその最終値の特定の誤差幅以内まで安定するのにかかる合計時間(スルー時間を含む)です。セトリング時間は、フルスケール範囲(FSR)の±0.003%以内(または他の指定された値)として規定されています。

12.1.1.2.3 コード変化/デジタル-アナログ・グリッチ・エネルギー

デジタル-アナログ・グリッチ・インパルスは、DACレジスタ内の入力コードの状態が変化したときに、アナログ出力に注入されるインパルスです。これは通常、ナノボルト秒(nV-s)単位のグリッチ面積として表され、デジタル入力コードがメジャー・キャリー遷移時に1LSB変化するときに測定されます。

12.1.1.2.4 デジタル・フィードスルー

デジタル・フィードスルーは、DACの出力に見られるDACのデジタル入力からのインパルスとして定義されます。これは、DAC出力が更新されていないときに測定されます。この値はnV-s単位で規定され、データ・バス上でのフルスケールのコード変化、つまりすべて0からすべて1に、またはその逆に変化したときに測定されます。

デバイス・サポート (continued)

12.1.1.2.5 チャネル間DCクロストーク

チャネル間DCクロストークは、1つのDACチャネルの出力の変化に対する、別のDACチャネルの出力レベルのDC変化として定義されます。これは、一方のDACチャネルを中間スケールに保持しながら、他のDACチャネルにフルスケール出力変化を与えることで測定されます。この値はLSB単位で表されます。

12.1.1.2.6 チャネル間ACクロストーク

マルチチャネルDACのACクロストークは、あるチャネルの出力値が周波数fで変化したときに隣接チャネルの出力に現れる、周波数f (およびその高調波)のAC干渉量として定義されます。これは、あるチャネルの出力を周波数1kHzの正弦波で発振させながら、隣接DACチャネル出力(ゼロ・スケールに保持)上の1kHz高調波の振幅を監視することで測定されます。この値はdB単位で表されます。

12.1.1.2.7 信号対雑音比(SNR)

信号対雑音比(SNR)は、出力信号の2乗平均平方根(RMS)の値を、出力周波数の半分より低い他のすべてのスペクトル成分(高調波やDCを除く)を合計したRMS値で除算した比率として定義されます。SNRはdB単位で測定されます。

12.1.1.2.8 全高調波歪み(THD)

全高調波歪み+ノイズは、基本周波数の値に対する、高調波とノイズのRMS値の比として定義されます。サンプリング・レートがf_Sのときの基本周波数振幅に対するパーセンテージで表されます。

12.1.1.2.9 スプリアスフリー・ダイナミック・レンジ(SFDR)

スプリアスフリー・ダイナミック・レンジ(SFDR)は、スプリアス・ノイズが基本波の信号に干渉または歪みを生じさせる前の、DACの有効なダイナミック・レンジです。SFDRは、DCからフル・ナイキスト帯域幅(DACサンプリング・レートの1/2、つまり$f_S/2$)までの高調波または非高調波の最大スパーの振幅と、基本波の振幅との差を表します。スパーとは、スペクトル・アナライザまたはフーリエ変換で確認される、DACのアナログ出力の任意の周波数成分です。SFDRは、dBc (搬送波に対するdB)単位で表されます。

12.1.1.2.10 信号対雑音比+歪み(SINAD)

SINADでは、内部のランダム・ノイズ電力の量子化に加えて、すべての高調波および顕著なスプリアス成分が、出力ノイズ電力の定義に含まれます。SINADは、指定された入力周波数およびサンプリング・レートf_SにおけるdBとして表されます。

12.1.1.2.11 DAC出力ノイズ密度

出力ノイズ密度は、内部で発生したランダム・ノイズとして定義されます。ランダム・ノイズはスペクトル密度($nV/\sqrt{Hz}$)として定義されます。この値は、DACに中間スケールを読み込んでから、出力のノイズを測定して得られます。

12.1.1.2.12 DAC出力ノイズ

DAC出力ノイズは、DAC出力の、望ましい値(特定の周波数帯域内で)からの任意の電圧偏差として定義されます。この値は、DACチャネルを中間スケールに保持しながら、出力電圧を0.1Hz～10Hzの帯域内にフィルタリングし、その振幅ピークを測定することで得られます。この値は、ピーク・ツー・ピーク電圧(V_{pp})で表されます。

12.1.1.2.13 フルスケール範囲(FSR)

フルスケール範囲(FSR)は、DACが供給するよう規定されているアナログ出力の最大値と最小値との差です。一般に、最大値と最小値も示されます。*n*ビットのDACでは、これらの値は一般にコード0および2^nと一致する値として与えられます。

Microwire is a trademark of National Semiconductor.
All other trademarks are the property of their respective owners.

12.6 静電気放電に関する注意事項

すべての集積回路は、適切なESD保護方法を用いて、取扱いと保存を行うようにして下さい。

静電気放電はわずかな性能の低下から完全なデバイスの故障に至るまで、様々な損傷を与えます。高精度の集積回路は、損傷に対して敏感であり、極めてわずかなパラメータの変化により、デバイスに規定された仕様に適合しなくなる場合があります。

12.7 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

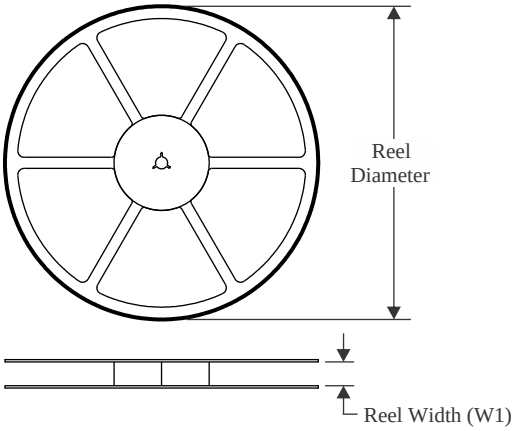
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

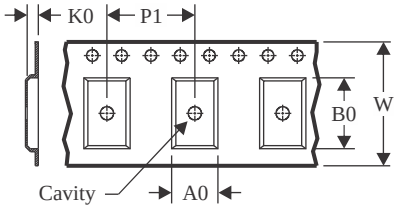
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

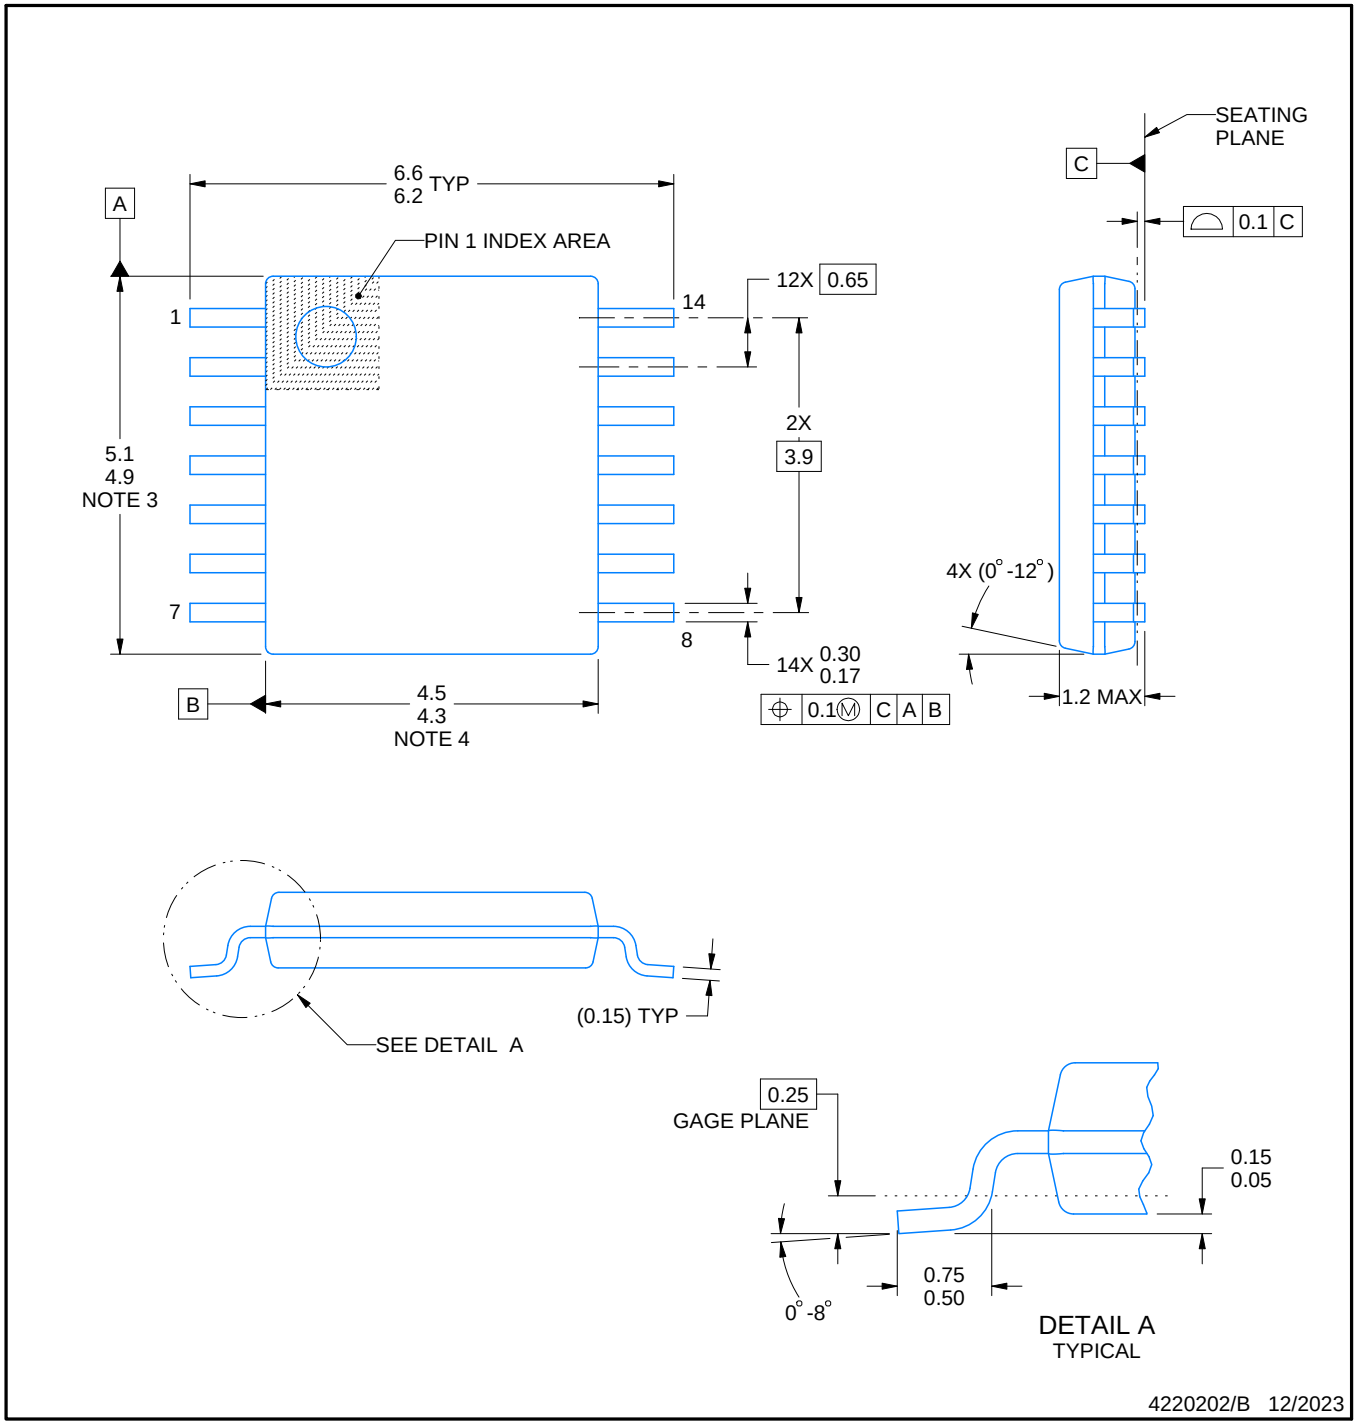
PACKAGE OUTLINE

PW0014A

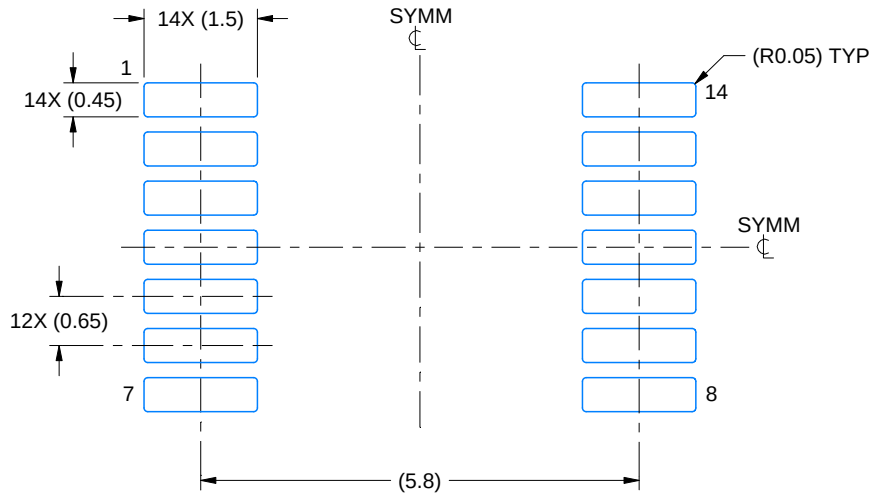
TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

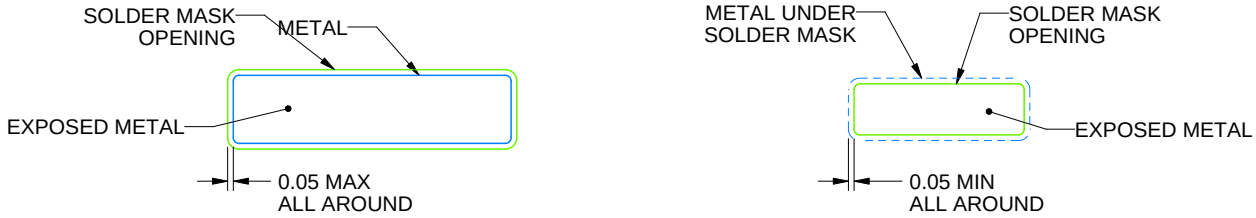


NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

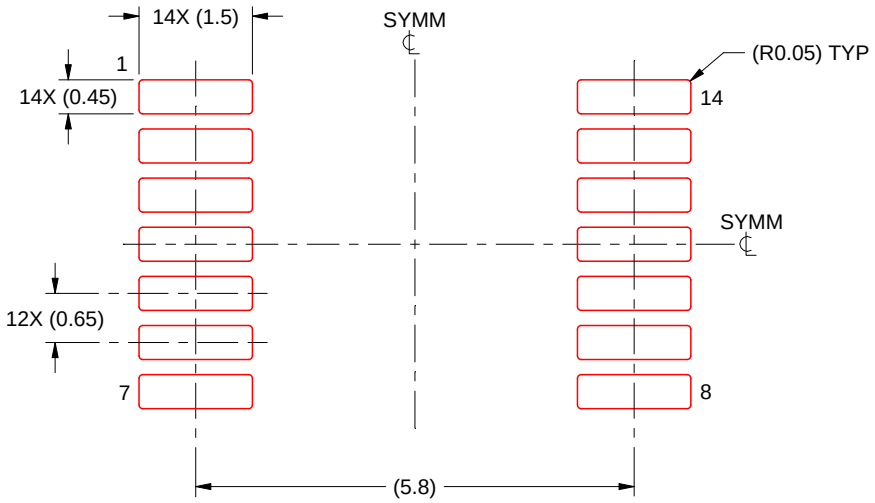


SOLDER MASK DETAILS

4220202/B 12/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE: 10X

4220202/B 12/2023

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
