

SN65DSI85-Q1 車載用、デュアル・チャンネル、MIPI[®] DSIからデュアル・リンクLVDSへのブリッジ

1 特長

- 車載アプリケーションに対応
- 下記内容でAEC-Q100認定済み：
 - デバイス温度グレード 2: 動作時周囲温度 -40°C ~ 105°C
 - デバイスHBM ESD分類レベル3A
 - デバイスCDM ESD分類レベルC6
- MIPI D-PHYバージョン1.00.00物理レイヤ・フロントエンドおよびDisplay Serial Interface (DSI) バージョン1.02.00を実装
- デュアル・チャンネルDSIレシーバは、チャンネルごとに1、2、3、4本のD-PHYデータ・レーンとして構成でき、レーンごとに最高1Gbpsで動作
- 18bppおよび24bppのDSIビデオ・パケットをRGB666およびRGB888フォーマットでサポート
- WQXGA 2560x1600解像度(60fps、18bppおよび24bppカラー)、およびWUXGA 1920x1200解像度(3Dグラフィック、60fps (120fpsと同等)、24bppカラー)に適切
- MIPIフロントエンドは、シングル・チャンネルまたはデュアル・チャンネルDSI構成用に設定可能
- シングル・リンクおよびデュアル・リンクLVDS用に出力を構成可能
- デュアル・チャンネルDSIで、ODDまたはEVENおよびLEFTまたはRIGHT動作モードをサポート
- 2つのシングル・チャンネルDSIから2つのシングル・リンクLVDSへの動作モードをサポート
- デュアル・リンクまたはシングル・リンク・モードでのLVDS出力クロック範囲25MHz~154MHz
- LVDSピクセル・クロックはフリーランニングの連続D-PHYクロックまたは外部リファレンス・クロック(REFCLK)により供給可能
- 1.8VのメインV_{CC}電源
- 低消費電力機能として、SHUTDOWNモード、低減LVDS出力電圧スイング、同相、MIPI超低消費電力状態(ULPS)をサポート
- PCB配線を簡素化するため、LVDSチャンネルSWAPおよびLVDS PIN順序の反転機能を搭載
- 64ピンの10mmx10mm HTQFP (PAP) PowerPAD™ ICパッケージで供給

2 アプリケーション

- インフォテインメント用のディスプレイ内蔵ヘッド・ユニット
- インフォテインメント用のリモート・ディスプレイ付きヘッド・ユニット
- インフォテインメント用のリアシート・エンターテインメント
- ハイブリッド車載クラスター
- 携帯ナビゲーション・デバイス
- ナビゲーション
- 産業用ヒューマン・マシン・インターフェイス(HMI)およびディスプレイ

3 概要

SN65DSI85-Q1 DSI-to-LVDSブリッジは、デュアル・チャンネルのMIPI D-PHYレシーバ・フロントエンド構成で、チャンネルごとに4つのレーンがあり、それぞれ1Gbpsで動作し、最大入力帯域幅は8Gbpsです。このブリッジはMIPI DSI 18bpp RGB666および24bpp RGB888パケットをデコードし、フォーマットされたビデオ・データストリームを、25MHz~154MHzのピクセル・クロックで動作するLVDS出力に変換して、リンクごとに4つのデータ・レーンを持つデュアル・リンクLVDS、シングル・リンクLVDS、または2つのシングル・リンクLVDSインターフェイスを提供します。

SN65DSI85-Q1デバイスは、WQXGA (2560 × 1600)、毎秒60フレーム(fps)と、WUXGAおよびフルHD (1920 × 1080)解像度で120fpsと等価の3Dグラフィック、最高24ビット/ピクセル(bpp)に適しています。DSIとLVDSのインターフェイス間のデータ・ストリーム・ミスマッチに適應するため、部分的なライン・バッファが実装されています。

SN65DSI85-Q1デバイスは、小型の外形の10mmx10mm、0.5mmピッチのHTQFPパッケージに搭載され、-40°C~105°Cの温度範囲で動作します。

製品情報⁽¹⁾

| 型番 | パッケージ | 本体サイズ(公称) |
|--------------|------------|-----------------|
| SN65DSI85-Q1 | HTQFP (64) | 10.00mmx10.00mm |

(1) 提供されているすべてのパッケージについては、巻末の注文情報を参照してください。

64-Pin HTQFP With PowerPAD™
Top View

See the [Layout](#) section for layout information.

Pin Functions

| PIN | | TYPE | DESCRIPTION |
|--------|-----|------|---|
| NAME | NO. | | |
| ADDR | 64 | I/O | Local I ² C interface target address select. See Table 6 . In normal operation this pin is an input. When the ADDR pin is programmed high, it must be tied to the same 1.8-V power rails where the SN65DSI85-Q1 VCC 1.8-V power rail is connected. |
| A_Y0P | 46 | O | LVDS channel A, LVDS data output 0 |
| A_Y0N | 47 | O | |
| A_Y1P | 44 | O | LVDS channel A, LVDS data output 1 |
| A_Y1N | 45 | O | |
| A_Y2P | 41 | O | LVDS channel A, LVDS data output 2 |
| A_Y2N | 42 | O | |
| A_Y3P | 36 | O | LVDS channel A, LVDS data output 3. A_Y3P and A_Y3N must be left not connected (NC) for 18-bpp panels. |
| A_Y3N | 37 | O | |
| A_CLKP | 38 | O | LVDS channel A, LVDS clock output |
| A_CLKN | 39 | O | |
| B_Y0P | 61 | O | LVDS channel B, LVDS data output 0 |
| B_Y0N | 62 | O | |
| B_Y1P | 59 | O | LVDS channel B, LVDS data output 1 |
| B_Y1N | 60 | O | |
| B_Y2P | 56 | O | LVDS channel B, LVDS data output 2 |
| B_Y2N | 57 | O | |
| B_Y3P | 50 | O | LVDS channel B, LVDS data output 3. B_Y3P and B_Y3N must be left NC for 18-bpp panels. |
| B_Y3N | 51 | O | |
| B_CLKP | 53 | O | LVDS channel B, LVDS clock output |
| B_CLKN | 54 | O | |
| DA0P | 19 | I | MIPI D-PHY channel A, data lane 0; data rate up to 1 Gbps. |
| DA0N | 20 | I | |
| DA1P | 21 | I | MIPI D-PHY channel A, data lane 1; data rate up to 1 Gbps |
| DA1N | 22 | I | |
| DA2P | 27 | I | MIPI D-PHY channel A, data lane 2; data rate up to 1 Gbps. |
| DA2N | 28 | I | |
| DA3P | 29 | I | MIPI D-PHY channel A, data lane 3; data rate up to 1 Gbps. |
| DA3N | 30 | I | |
| DACP | 24 | I | MIPI D-PHY channel A, clock lane; data rate up to 1 Gbps. |
| DACN | 25 | I | |
| DB0P | 4 | I | MIPI D-PHY channel B, data lane 0; data rate up to 1 Gbps. |
| DB0N | 5 | I | |
| DB1P | 6 | I | MIPI D-PHY channel B, data lane 1; data rate up to 1 Gbps. |
| DB1N | 7 | I | |
| DB2P | 10 | I | MIPI D-PHY channel B, data lane 2; data rate up to 1 Gbps. |
| DB2N | 11 | I | |
| DB3P | 12 | I | MIPI D-PHY channel B, data lane 3; data rate up to 1 Gbps. |
| DB3N | 13 | I | |
| DBCP | 8 | I | MIPI D-PHY channel B, clock lane; operates up to 1 Gbps. |
| DBCN | 9 | I | |
| EN | 2 | I | Chip enable and reset. The device is reset (shutdown) when the EN pin is low. |
| GND | 23 | G | Reference ground |
| | 26 | G | |
| | 52 | G | |

Pin Functions (continued)

| PIN | | TYPE | DESCRIPTION |
|-----------------|-----|------|---|
| NAME | NO. | | |
| IRQ | 33 | O | Interrupt signal |
| REFCLK | 17 | I | This pin is an optional external reference clock for the LVDS pixel clock. If an external reference clock is not used, this pin must be pulled to ground with an external resistor. The source of the reference clock must be placed as close as possible with a series resistor near the source to reduce EMI. |
| RSVD1 | 34 | I/O | Reserved. This pin must be left unconnected for normal operation. |
| RSVD2 | 1 | I | Reserved. This pin must be left unconnected for normal operation. |
| SCL | 15 | I | Local I ² C interface clock. |
| SDA | 16 | I/O | Local I ² C interface data |
| V _{CC} | 3 | — | 1.8-V power supply |
| | 14 | — | |
| | 18 | — | |
| | 32 | — | |
| | 35 | — | |
| | 40 | — | |
| | 43 | — | |
| | 48 | — | |
| | 49 | — | |
| | 55 | — | |
| | 58 | — | |
| | 63 | — | |
| VCORE | 31 | P | 1.1-V output from the voltage regulator. This pin must have a 1-μF external capacitor to ground. |
| PowerPAD | | — | Reference ground |

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|------------------|--------------------------------|---|-------|------|
| V _{CC} | Supply voltage | -0.3 | 2.175 | V |
| | Input voltage | CMOS input pins | | V |
| | | DSI input pins (DAXP, DAXN, DBXP, and DBXN) | | V |
| T _A | Operating free-air temperature | -40 | 105 | °C |
| T _J | Junction temperature | -40 | 115 | °C |
| T _{stg} | Storage temperature | -65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|---|------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ | |
| | | ±4000 | V |
| | | ±1000 | |

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|-----------------------|---|-------------------------------|-----|------|-------------------|
| V _{CC} | V _{CC} power supply | 1.65 | 1.8 | 1.95 | V |
| V _{PSN} | Supply noise on any V _{CC} pin | $f_{(noise)} > 1 \text{ MHz}$ | | 0.05 | V |
| V _(DSI) | DSI input pin voltage | -50 | | 1350 | mV |
| f _(I2C) | Local I ² C input frequency | | | 400 | kHz |
| f _{HS(CLK)} | DSI high-speed (HS) clock input frequency | 40 | | 500 | MHz |
| t _{su} | DSI HS data to clock setup time; see Figure 1 | 0.15 | | | UI ⁽¹⁾ |
| t _h | DSI HS data to clock hold time; see Figure 1 | 0.15 | | | UI ⁽¹⁾ |
| Z _{OD(LVDS)} | LVDS output differential impedance | 90 | | 132 | Ω |
| T _C | Case temperature | | | 92.2 | °C |

(1) The unit interval (UI) is one half of the period of the HS clock; at 500 MHz the minimum setup and hold time is 150 ps.

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | SN65DSI85-Q1 | UNIT |
|-------------------------------|--|--------------|------|
| | | PAP (HTQFP) | |
| | | 64 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 36.1 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 18.2 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 20.6 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 0.8 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 20.5 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 2.2 | °C/W |

 (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP ⁽¹⁾ | MAX | UNIT |
|-------------------|---|--|--------------------|-----------------------|------|
| V _{IL} | Low-level control signal input voltage | | | 0.3 × V _{CC} | V |
| V _{IH} | High-level control signal input voltage | 0.7 × V _{CC} | | | V |
| V _{OH} | High-level output voltage | I _{OH} = -4 mA | | | V |
| V _{OL} | Low-level output voltage | I _{OL} = 4 mA | | 0.4 | V |
| I _{LKG} | Input failsafe leakage current | V _{CC} = 0; V _{CC(PIN)} = 1.8 V | | ±30 | μA |
| I _{IH} | High level input current | Any input terminal | | ±30 | μA |
| I _{IL} | Low level input current | Any input terminal | | ±30 | μA |
| I _{OZ} | High-impedance output current | CMOS output terminals | | ±10 | μA |
| I _{OS} | Short-circuit output current | Any output driving GND short | | ±50 | mA |
| I _{CC} | Device active current | See ⁽²⁾ | 127 | 232 | mA |
| I _{ULPS} | Device standby current | All data and clock lanes are in ultra-low power state (ULPS) | 7.7 | 14 | mA |
| I _{RST} | Shutdown current | EN = 0 | 0.04 | 130 | μA |
| R _{EN} | EN control input resistor | | 200 | | kΩ |

 (1) All typical values are at V_{CC} = 1.8V and T_A = 25°C

(2) SN65DSI85-Q1: DUAL Channel DSI to DUAL Channel LVDS, 1920 x 1200

(a) number of LVDS lanes = 2 × (3 data lanes + 1 CLK lane)

(b) number of DSI lanes = 2 × (4 data lanes + 1 CLK lane)

(c) LVDS CLK OUT = 81.6 M

(d) DSI CLK = 490 M

(e) RGB888, LVDS18bpp

 Maximum values are at V_{CC} = 1.95 V and T_A = 105°C

Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP ⁽¹⁾ | MAX | UNIT |
|---------------------------|--|---|-----|--------------------|-----|------|
| MIPI DSI INTERFACE | | | | | | |
| V _{IH-LP} | LP receiver input high threshold | See Figure 2 | 880 | | | mV |
| V _{IL-LP} | LP receiver input low threshold | See Figure 2 | | | 550 | mV |
| V _{ID} | HS differential input voltage | | 100 | | 270 | mV |
| V _{IDT} | HS differential input voltage threshold | | | | 50 | mV |
| V _{IL-ULPS} | LP receiver input low threshold; ultra-low power state (ULPS) | | | | 300 | mV |
| V _{CM-HS} | HS common mode voltage; steady-state | | 70 | | 330 | mV |
| ΔV _{CM-HS} | HS common mode peak-to-peak variation including symbol delta and interference | | | | 100 | mV |
| V _{IH-HS} | HS single-ended input high voltage | See Figure 2 | | | 460 | mV |
| V _{IL-HS} | HS single-ended input low voltage | See Figure 2 | –40 | | | mV |
| V _{TERM-EN} | HS termination enable; single-ended input voltage (both Dp AND Dn apply to enable) | Termination is switched simultaneous for Dn and Dp | | | 450 | mV |
| R _{DIFF-HS} | HS mode differential input impedance | | 80 | | 125 | Ω |
| LVDS OUTPUT | | | | | | |
| V _{OD} | Steady-state differential output voltage for A _{Yx} P/N and B _{Yx} P/N | CSR 0x19.3:2=00 and, or CSR 0x19.1:0=00 100 Ω near end termination | 180 | 245 | 330 | mV |
| | | CSR 0x19.3:2=01 and, or CSR 0x19.1:0=01 100 Ω near end termination | 215 | 293 | 392 | |
| | | CSR 0x19.3:2=10 and, or CSR 0x19.1:0=10 100 Ω near end termination | 250 | 341 | 455 | |

| R _{LVDS_DIS} | Pulldown resistance for disabled LVDS outputs | | 1 | | kΩ |

 (3) Tested at V_{CC} = 1.8V, T_A = –40°C for MIN, T_A = 25°C for TYP, T_A = 105°C for MAX.

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP ⁽¹⁾ | MAX | UNIT |
|---|--|--|------------------|--------------------|------------------|------|
| DSI | | | | | | |
| t_{GS} | DSI LP glitch suppression pulse width | | | | 300 | ps |
| LVDS | | | | | | |
| t_c | Output clock period | | 6.49 | | 40 | ns |
| t_w | High-level output clock (CLK) pulse duration | | | $4/7 t_c$ | | ns |
| t_0 | Delay time, CLK \uparrow to 1st serial bit position | $t_c = 6.49$ ns; Input clock jitter < 25 ps (REFCLK) See Figure 4 | -0.15 | | 0.15 | ns |
| t_1 | Delay time, CLK \uparrow to 2nd serial bit position | | $1/7 t_c - 0.15$ | | $1/7 t_c + 0.15$ | ns |
| t_2 | Delay time, CLK \uparrow to 3rd serial bit position | | $2/7 t_c - 0.15$ | | $2/7 t_c + 0.15$ | ns |
| t_3 | Delay time, CLK \uparrow to 4th serial bit position | | $3/7 t_c - 0.15$ | | $3/7 t_c + 0.15$ | ns |
| t_4 | Delay time, CLK \uparrow to 5th serial bit position | | $4/7 t_c - 0.15$ | | $4/7 t_c + 0.15$ | ns |
| t_5 | Delay time, CLK \uparrow to 6th serial bit position | | $5/7 t_c - 0.15$ | | $5/7 t_c + 0.15$ | ns |
| t_6 | Delay time, CLK \uparrow to 7th serial bit position | | $6/7 t_c - 0.15$ | | $6/7 t_c + 0.15$ | ns |
| t_r | Differential output rise-time | See Figure 4 | | | 180 | ps |
| t_f | Differential output fall-time | | | | 500 | |
| | LVDS CLK A to CLK B skew | | -10 | | 10 | ps |
| EN, ULPS, RESET | | | | | | |
| t_{en} | Enable time from EN or ULPS; see | $t_{c(o)} = 12.9$ ns | | | 1 | ms |
| t_{dis} | Disable time to standby | $t_{c(o)} = 12.9$ ns | | | 0.1 | ms |
| t_{reset} | Reset Time | | 10 | | | ms |
| REFCLK | | | | | | |
| F_{REFCLK} | REFCLK Frequency. Supported frequencies: 25 MHz - 15.4 MHz | | 25 | | 154 | MHz |
| t_r, t_f | REFCLK rise and fall time | | 100ps | | 1ns | s |
| t_{pj} | REFCLK Peak-to-Peak Phase Jitter | | | | 50 | ps |
| Duty | REFCLK Duty Cycle | | 40% | 50% | 60% | |
| REFCLK or DSI CLK (DACP/N, DBCP/N) | | | | | | |
| SSC_CLKIN | SSC enabled Input CLK center spread depth ⁽²⁾ | | 0.5% | 1% | 2% | |
| | Modulation Frequency Range | | 30 | | 60 | kHz |

(1) All typical values are at $V_{CC} = 1.8$ V and $T_A = 25^\circ\text{C}$

(2) For EMI reduction purpose, SN65DSI85-Q1 supports the center spreading of the LVDS CLK output through the REFCLK or DSI CLK input. The center spread CLK input to the REFCLK or DSI CLK is passed through to the LVDS CLK output A_CLKP/N and/or B_CLKP/N.

8 Detailed Description

8.1 Overview

The SN65DSI85-Q1 device is an AEC-Q100 qualified, 2-channel MIPI DSI to dual-link LVDS transmitter. The device features a dual-channel MIPI D-PHY receiver front-end configurable for 1 to 4 data lanes per channel operating at 1 Gbps/lane for a maximum input bandwidth of 8 Gbps. This device decodes MIPI DSI 18-bpp RGB666 and 24-bpp RGB888 data stream and converts it to an LVDS output operating at pixel-clock frequencies of 25 MHz to 154 MHz. The LVDS output can be configured as a dual-link LVDS, two single-link LVDS, or a single-link LVDS output interface with four data lanes per link.

8.3 Feature Description

8.3.1 Reset Implementation

When the EN pin is deasserted (low), the SN65DSI85-Q1 device is in SHUTDOWN or RESET state. In this state, CMOS inputs are ignored, the MIPI D-PHY inputs are disabled and outputs are high impedance. Transitioning the EN input from a low to a high level after the V_{CC} supply has reached the minimum operating voltage as shown in Figure 6 is critical. This transition is achieved by a control signal to the EN input, or by an external capacitor connected between EN and GND.

Figure 6. Cold-Start V_{CC} Ramp Up to EN

When implementing the external capacitor, the size of the external capacitor depends on the power up ramp of the V_{CC} supply, where a slower ramp-up results in a larger value external capacitor. See the latest reference schematic for the SN65DSI85-Q1 device and, or consider an approximately 200-nF capacitor as a reasonable first estimate for the size of the external capacitor.

Figure 7 and Figure 8 show both EN implementations.

Figure 7. External Capacitor Controlled EN

Figure 8. EN Input from Active Controller

When the SN65DSI85-Q1 is reset while V_{CC} is high, the EN pin must be held low for at least 10 ms before being asserted high as described in Table 1 to be sure that the device is properly reset. The DSI CLK lane MUST be in HS and the DSI data lanes MUST be driven to LP11 while the device is in reset before the EN pin is asserted per the timing described in Table 1.

8.3.2 Initialization Setup

Use the following initialization sequence to setup the SN65DSI85-Q1. This sequence is required for proper operation of the device. Steps 9 through 11 in the sequence are optional.

For additional information see Figure 6.

Feature Description (continued)
Table 1. Initialization Sequence

| INITIALIZATION SEQUENCE NUMBER | INITIALIZATION SEQUENCE DESCRIPTION |
|--------------------------------|--|
| Init seq 1 | Power on |
| Init seq 2 | After power is applied and stable, the DSI CLK lanes MUST be in HS state and the DSI data lanes MUST be driven to LP11 state |
| Init seq 3 | Set EN pin to Low |
| Wait 10 ms ⁽¹⁾ | |
| Init seq 4 | Tie EN pin to High |
| Wait 10 ms ⁽¹⁾ | |
| Init seq 5 | Initialize all CSR registers to their appropriate values based on the implementation (The SN65DSI8x is not functional until the CSR registers are initialized) |
| Init seq 6 | Set the PLL_EN bit (CSR 0x0D.0) |
| Wait 10 ms ⁽¹⁾ | |
| Init seq 7 | Set the SOFT_RESET bit (CSR 0x09.0) |
| Wait 10 ms ⁽¹⁾ | |
| Init seq 8 | Change DSI data lanes to HS state and start DSI video stream |
| Wait 5 ms ⁽¹⁾ | |
| Init seq 9 | Read back all registers and confirm they were correctly written |
| Init seq 10 | Write 0xFF to CSR 0xE5 to clear the error registers |
| Wait 1 ms ⁽¹⁾ | |
| Init seq 11 | Read CSR 0xE5. If CSR 0xE5 != 0x00, then go back to step #2 and re-initialize |

(1) Minimum recommended delay. This value can be exceeded.

8.3.3 LVDS Output Formats

The SN65DSI85-Q1 device processes DSI packets and produces video data driven to the LVDS interface in an industry standard format. Single-Link LVDS and Dual-Link LVDS are supported by the SN65DSI85-Q1 device. When the LVDS output is implemented in a Dual-Link configuration, channel A carries the odd pixel data, and channel B carries the even pixel data. During conditions such as the default condition, and some video synchronization periods, where no video stream data is passing from the DSI input to the LVDS output, the SN65DSI85-Q1 device transmits zero value pixel data on the LVDS outputs while maintaining transmission of the vertical sync and horizontal sync status.

Figure 9 shows a Single-Link LVDS 18-bpp application.

Figure 10 shows a Dual-Link 24-bpp application using Format 2, controlled by CHA_24BPP_FORMAT1 (CSR 0x18.1) and CHB_24BPP_FORMAT1 (CSR 0x18.0). In data Format 2, the two MSB per color are transferred on the Y3P/N LVDS lane.

Figure 11 shows a 24 bpp Single-Link application using Format 1. In data Format 1, the two LSB per color are transferred on the Y3P/N LVDS lane.

Figure 12 shows a Single-Link LVDS application where 24 bpp data is received from DSI and converted to 18 bpp data for transmission to an 18 bpp panel. This application is configured by setting CHA_24BPP_FORMAT1 (CSR 0x18.1) to 1 and CHA_24BPP_MODE (CSR 0x18.3) to 0. In this configuration, the SN65DSI85-Q1 will not transmit the 2 LSB per color since the Y3P/N LVDS lane is disabled.

NOTE

Note: Figure 9, Figure 10, Figure 11, and Figure 12 only illustrate a few example applications for the SN65DSI85-Q1. Other applications are also supported.

DE = Data Enable; Channel B Clock, Channel B Data, and A_Y3P/N are Output Low

Figure 9. LVDS Output Data Single-Link 18 bpp

DE = Data Enable; (o) = Odd Pixels; (e) = Even Pixels

Figure 10. LVDS Output Data (Format 2) Dual-Link 24 bpp

DE = Data Enable; Channel B Clock and Data are Output Low

Figure 11. LVDS Output Data (Format 1) Single-Link 24 bpp

DE = Data Enable; Channel B Clock, Channel B Data, and A_Y3P/N are Output Low; Channel B Clock, Channel B Data, and A_Y3P/N are Output Low

8.3.4 DSI Lane Merging

The SN65DSI85-Q1 supports four DSI data lanes per input channel, and may be configured to support one, two, or three DSI data lanes per channel. Unused DSI input pins on the SN65DSI85-Q1 should be left unconnected or driven to LP11 state. The bytes received from the data lanes are merged in HS mode to form packets that carry the video stream. DSI data lanes are bit and byte aligned.

Figure 13 shows the lane merging function for each channel; 4-Lane, 3-Lane, and 2-Lane modes are illustrated

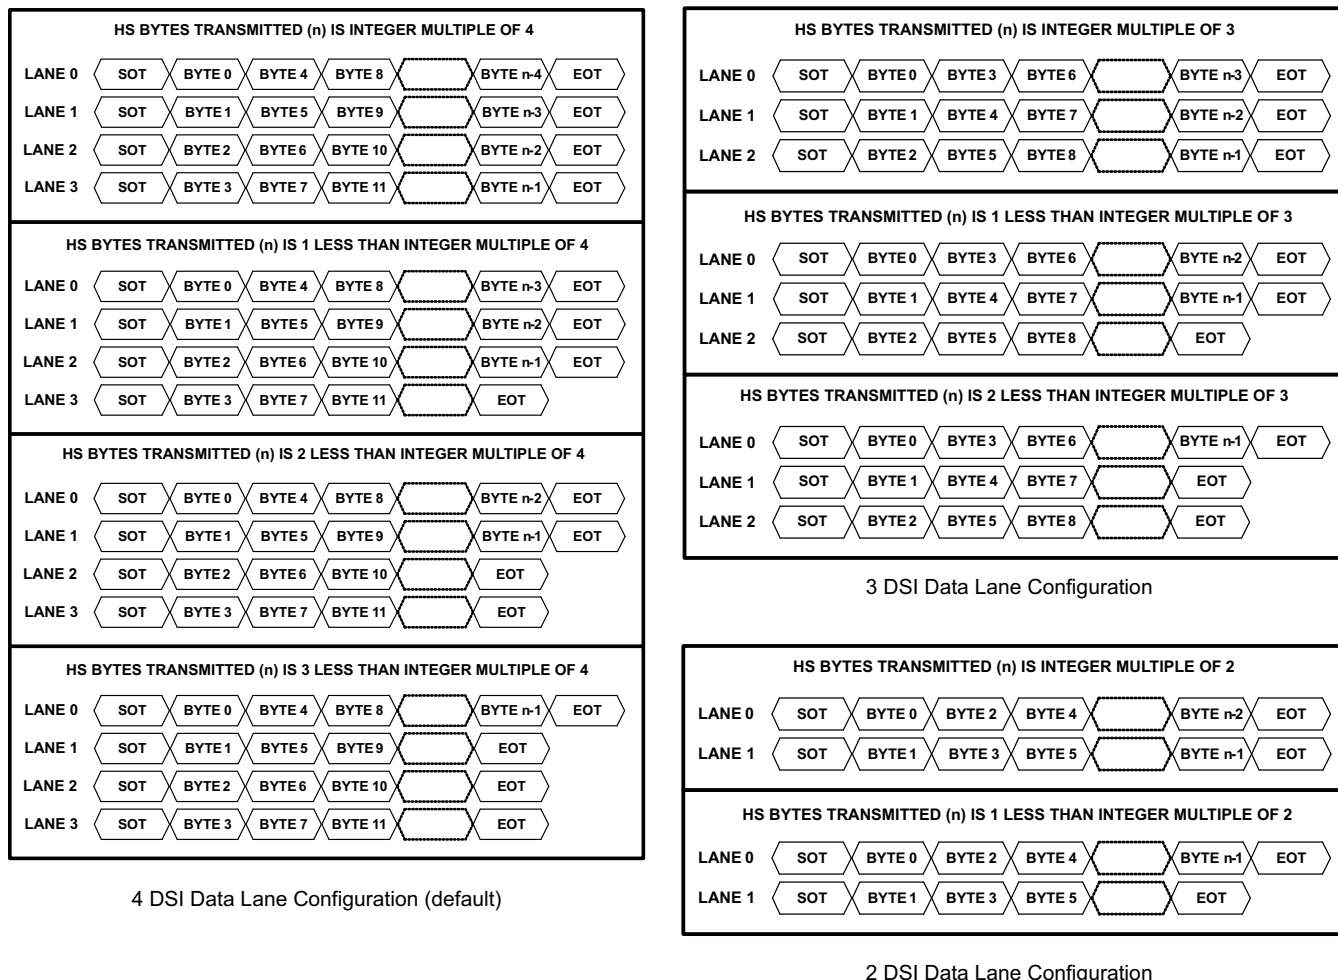

Figure 13. SN65DSI85-Q1 DSI Lane Merging Illustration

8.3.5 DSI Pixel Stream Packets

The SN65DSI85-Q1 processes 18-bpp (RGB666) and 24-bpp (RGB888) DSI packets on each channel as shown in Figure 14, Figure 15, and Figure 16.

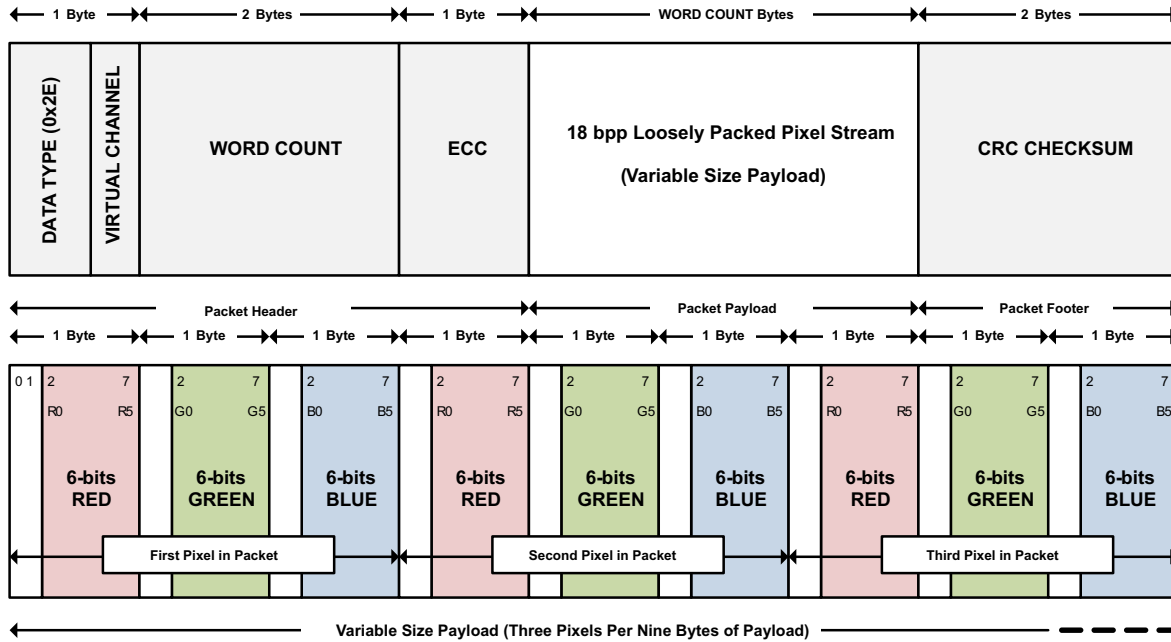

Figure 14. 18-bpp (Loosely Packed) DSI Packet Structure

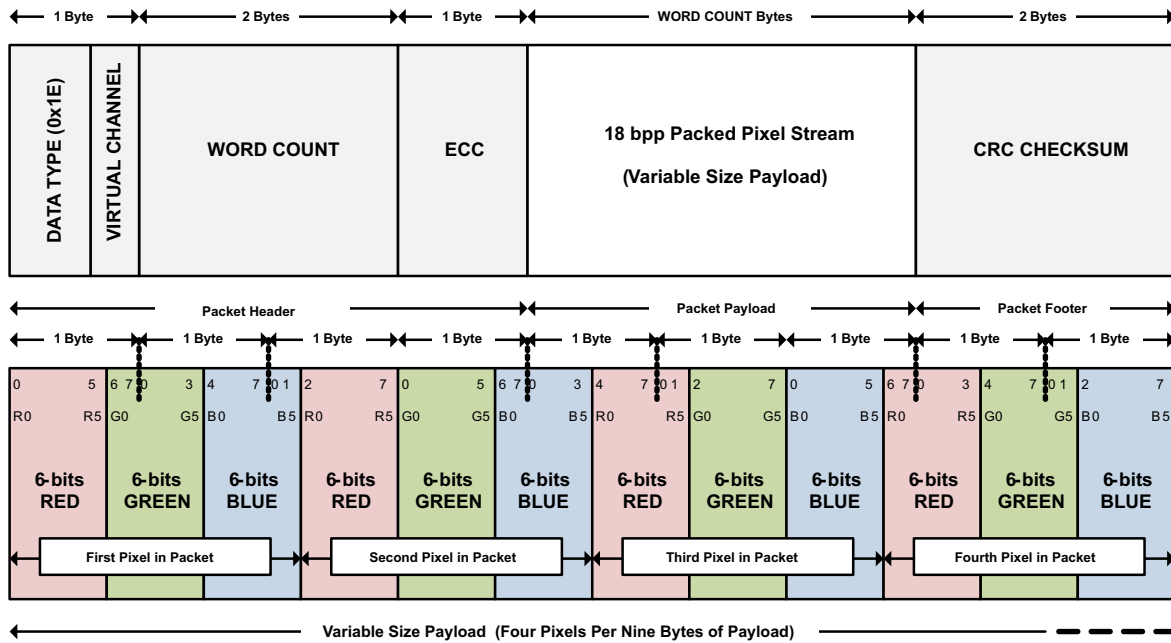

Figure 15. 18-bpp (Tightly Packed) DSI Packet Structure

Figure 16. 24-bpp DSI Packet Structure

8.3.6 DSI Video Transmission Specifications

The SN65DSI85-Q1 supports burst video mode and non-burst video mode with sync events or with sync pulses packet transmission as described in the DSI specification. The burst mode supports time-compressed pixel stream packets that leave added time per scan line for power savings LP mode. The SN65DSI85-Q1 requires a transition to LP mode once per frame to enable PHY synchronization with the DSI host processor; however, for a robust and low-power implementation, the transition to LP mode is recommended on every video line.

Figure 17 shows the DSI video transmission applied to SN65DSI85-Q1 applications. In all applications, the LVDS output rate must be less than or equal to the DSI input rate. The first line of a video frame shall start with a VSS packet, and all other lines start with VSE or HSS. The position of the synchronization packets in time is of utmost importance since this has a direct impact on the visual performance of the display panel; that is, these packets generate the HS and VS (horizontal and vertical sync) signals on the LVDS interface after the delay programmed into CHA_SYNC_DELAY_LOW/HIGH (CSR 0x28.7:0 and 0x29.3:0) and/or CHB_SYNC_DELAY_LOW/HIGH (CSR 0x2A.7:0 and 0x2B.3:0). When configured for dual DSI channels, the SN65DSI85-Q1 uses the VSS, VSE, and HSS packets from channel A to generate the HS and VS (horizontal and vertical sync) signals on the LVDS interface, and the VSS, VSE, and HSS packets from channel B are ignored.

As required in the DSI specification, the SN65DSI85-Q1 requires that pixel stream packets contain an integer number of pixels (i.e. end on a pixel boundary); it is recommended to transmit an entire scan line on one pixel stream packet. When a scan line is broken in to multiple packets, inter-packet latency shall be considered such that the video pipeline (ie. pixel queue or partial line buffer) does not run empty (i.e. under-run); during scan line processing, if the pixel queue runs empty, the SN65DSI85-Q1 transmits zero data (18'b0 or 24'b0) on the LVDS interface.

When configured for dual DSI channels, the SN65DSI85-Q1 supports ODD/EVEN configurations and LEFT/RIGHT configurations. In the ODD/EVEN configuration, the odd pixels for each scan line are received on channel A, and the even pixels are received on channel B. In LEFT/RIGHT mode, the LEFT portion of the line is received on channel A, and the right portion of the line is received on channel B. Neither the channel A LEFT portion input or the channel B RIGHT portion input per line shall exceed 1408 pixels, which is defined as 1/2 of the maximum line size (2560 pixels in WQXGA 2560x1600 mode) plus 10% headroom. The pixels received on channel B in LEFT/RIGHT mode are buffered during the LEFT side transmission to LVDS, and begin transmission to LVDS when the LEFT-side input buffer runs empty.

When configured for two single DSI channels, the SN65DSI85-Q1 requires that the LVDS output clocks for both video data streams be the same.

NOTE

When the HS clock is used as a source for the LVDS pixel clock, the LP mode transitions apply only to the data lanes, and the DSI clock lane remains in the HS mode during the entire video transmission.

The DSI85 does not support the DSI Virtual Channel capability or reverse direction (peripheral to processor) transmissions.

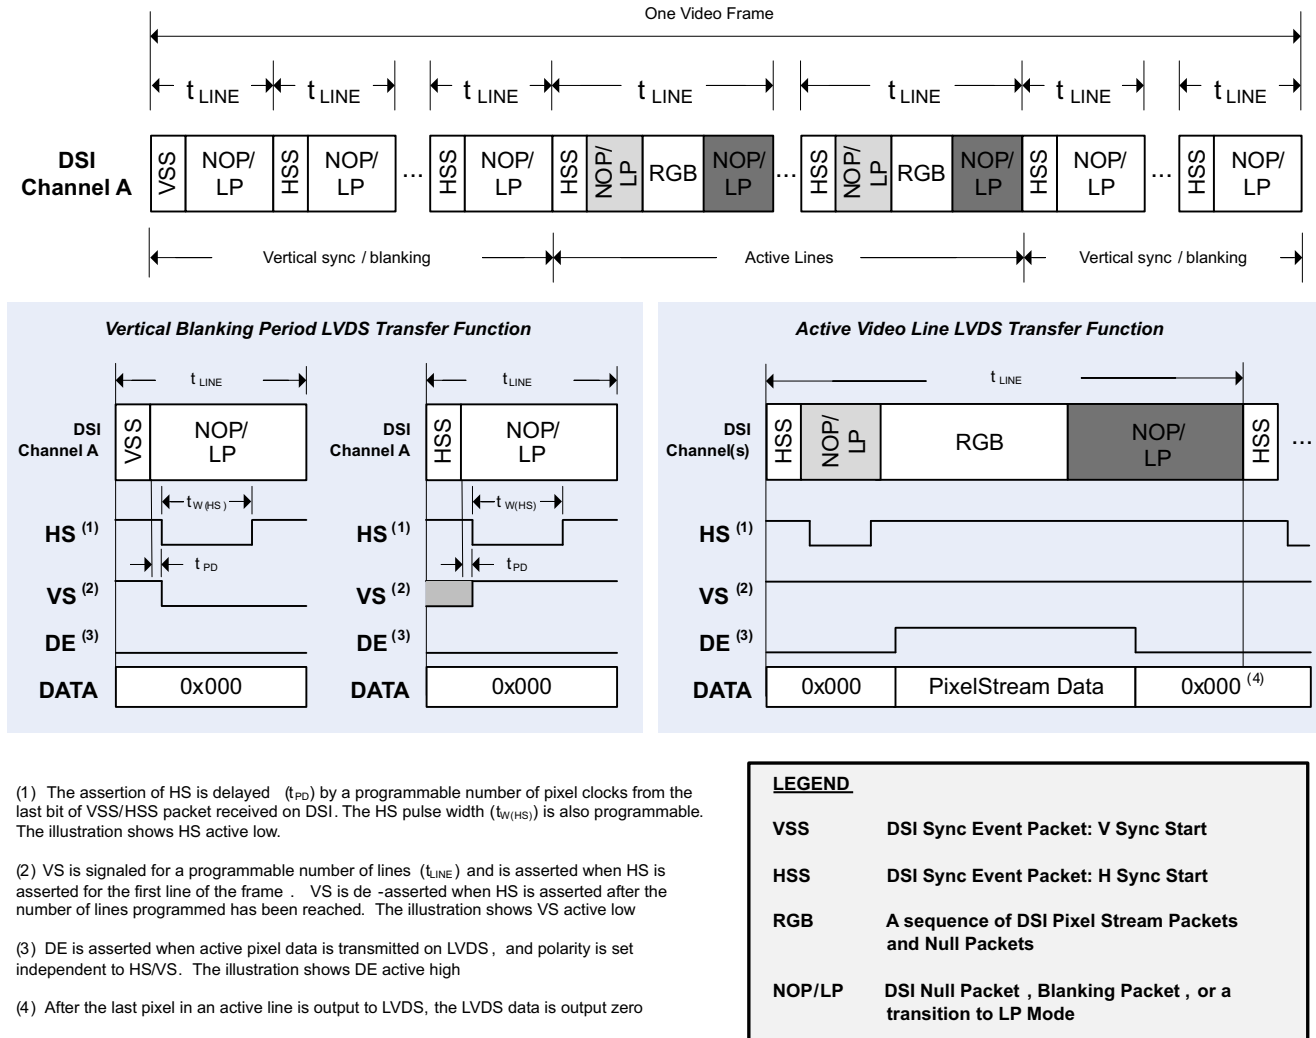

Figure 17. DSI Channel Transmission and Transfer Function

8.3.7 ULPS

The SN65DSI85-Q1 supports the MIPI defined ultra-low power state (ULPS). While the device is in the ULPS, the CSR registers are accessible via I2C interface. ULPS sequence should be issued to all active DSI CLK and/or DSI data lanes of the enabled DSI Channels for the SN65DSI85-Q1 enter the ULPS. The Following sequence should be followed to enter and exit the ULPS.

1. Host issues a ULPS entry sequence to all DSI CLK and data lanes enabled.
2. When host is ready to exit the ULPS mode, host issues a ULPS exit sequence to all DSI CLK and data lanes that need to be active in normal operation.
3. Wait for the PLL_LOCK bit (CSR 0x0A.7) to be set.
4. Set the SOFT_RESET bit (CSR 0x09.0).
5. Device resumes normal operation.(i.e video streaming resumes on the panel).

8.3.8 LVDS Pattern Generation

The SN65DSI85-Q1 supports a pattern generation feature on LVDS Channels. This feature can be used to test the LVDS output path and LVDS panels in a system platform. The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C. No DSI data is received while the pattern generation feature is enabled.

There are three modes available for LVDS test pattern generation. The mode of test pattern generation is determined by register configuration as shown in the tables below.

Table 2. Test Pattern Generation

| Test pattern generation mode | Register configurations |
|---|---|
| Single LVDS configuration mode | LVDS_LINK_CFG(CSR 0x18.4) = 1b DSI_CH_MODE(CSR 0x10.6:5) = XXb CHA_TEST_PATTERN(CSR 0x3C.4) = 1b CHB_TEST_PATTERN(CSR 0x3C.0) = 0b |
| Dual LVDS configuration mode | LVDS_LINK_CFG(CSR 0x18.4) = 0b DSI_CH_MODE(CSR 0x10.6:5) = 0Xb CHA_TEST_PATTERN(CSR 0x3C.4) = 1b CHB_TEST_PATTERN(CSR 0x3C.0) = 0b |
| Two independent LVDS configuration mode | LVDS_LINK_CFG(CSR 0x18.4) = 0b DSI_CH_MODE(CSR 0x10.6:5) = 10b CHA_TEST_PATTERN(CSR 0x3C.4) = 1b CHB_TEST_PATTERN(CSR 0x3C.0) = 1b |

The [Table 3](#) and [Table 4](#) list video registers that must be configured for test pattern generation video parameters.

1. Single LVDS configuration

Table 3. Video Registers

| ADDRESS BIT | REGISTER NAME | SECTION |
|-------------|--------------------------------|------------------------|
| 0x20.7:0 | CHA_ACTIVE_LINE_LENGTH_LOW | <i>Video Registers</i> |
| 0x21.3:0 | CHA_ACTIVE_LINE_LENGTH_HIGH | |
| 0x24.7:0 | CHA_VERTICAL_DISPLAY_SIZE_LOW | |
| 0x25.3:0 | CHA_VERTICAL_DISPLAY_SIZE_HIGH | |

| 0x39.7:0 | CHB_HORIZONTAL_FRONT_PORCH | |
| 0x3B.7:0 | CHB_VERTICAL_FRONT_PORCH | |

8.4 Device Functional Modes

8.4.1 Operating Modes

The SN65DSI85-Q1 can be configured for several different operating modes via LVDS_LINK_CFG (CSR 0x18.4), LEFT_RIGHT_PIXELS (CSR 0x10.7), and DSI_CHANNEL_MODE (CSR 0x10.6:5). These modes are summarized in [Table 5](#). In each of the modes, video data can be 18 bpp or 24 bpp.

Table 5. SN65DSI85-Q1 Operating Modes

| MODE | CSR 0x18.4 | CSR 0x10.7 | CSR 0x10.6:5 | DESCRIPTION |
|--|---------------|-------------------|--------------|---|
| | LVDS_LINK_CFG | LEFT_RIGHT_PIXELS | DSI_CH_MODE | |
| Single DSI Input to Single-Link LVDS | 1 | N/A | 01 | Single DSI Input on Channel A to Single-Link LVDS output on Channel A. |
| Single DSI Input to Dual-Link LVDS | 0 | N/A | 01 | Single DSI Input on Channel A to Dual-Link LVDS output with Odd pixels on Channel A and Even pixels on Channel B. |
| Dual DSI Input (Odd/Even) to Single-Link LVDS ⁽¹⁾ | 1 | 0 | 00 | Dual DSI Input with Odd pixels received on Channel A and Even pixels received on Channel B. Data is output to Single-Link LVDS on Channel A. |
| Dual DSI Input (Odd/Even) to Dual-Link LVDS ⁽¹⁾ | 0 | 0 | 00 | Dual DSI Input with Odd pixels received on Channel A and Even pixels received on Channel B. Data is output to Dual-Link LVDS with Odd pixels on Channel A and Even pixels on Channel B. |
| Dual DSI Input (Left/Right) to Single-Link LVDS ⁽²⁾ | 1 | 1 | 00 | Dual DSI Input with Left pixels received on Channel A and Right pixels received on Channel B. Data is output to Single-Link LVDS on Channel A. |
| Dual DSI Input (Left/Right) to Dual-Link LVDS ⁽²⁾ | 0 | 1 | 00 | Dual DSI Input with Left pixels received on Channel A and Right pixels received on Channel B. Data is output to Dual-Link LVDS with Odd pixels on Channel A and Even pixels on Channel B. |
| Dual DSI Inputs (two streams) to two Single-Link LVDS ⁽³⁾ | 0 | N/A | 10 | One video stream input on DSI Channel A and output to Single-Link LVDS on Channel A. Another video stream input on DSI Channel B and output to Single-Link LVDS on Channel B. |

- (1) In these modes, DSI Channel A and DSI Channel B must be set to have the same number of data lanes enabled and the data format must be the same for both lanes.
- (2) In these modes, DSI Channel A and DSI Channel B can each have a different number of data lanes enabled, but the data format must be the same for both lanes.
- (3) In this mode, DSI Channel A and DSI Channel B can each have a different number of data lanes enabled, and the data format for each Channel can be different.

8.5 Programming

8.5.1 Clock Configurations and Multipliers

The LVDS clock may be derived from the DSI channel A clock, or from an external reference clock source. When the MIPI D-PHY channel A HS clock is used as the LVDS clock source, the D-PHY clock lane must operate in HS free-running (continuous) mode; this feature eliminates the need for an external reference clock reducing system costs

The reference clock source is selected by HS_CLK_SRC (CSR 0x0A.0) programmed through the local I²C interface. If an external reference clock is selected, it is multiplied by the factor in REFCLK_MULTIPLIER (CSR 0x0B.1:0) to generate the LVDS output clock. When an external reference clock is selected, it must be between 25 MHz and 154 MHz. If the DSI channel A clock is selected, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE (CSR 0x12) must be set to the frequency range of the LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) must be set to enable the internal PLL.

8.6 Register Maps

8.6.1 Local I²C Interface Overview

The SN65DSI85-Q1 local I²C interface is enabled when EN is input high, access to the CSR registers is supported during ultra-low power state (ULPS). The SCL and SDA pins are used for I²C clock and I²C data respectively. The SN65DSI85-Q1 I²C interface conforms to the two-wire serial interface defined by the I²C Bus Specification, Version 2.1 (January 2000), and supports fast mode transfers up to 400 kbps.

The device address byte is the first byte received following the START condition from the master device. The 7 bit device address for SN65DSI85-Q1 device is factory preset to 010110X with the least significant bit being determined by the ADDR control input. Table 6 clarifies the SN65DSI85-Q1 target address.

Table 6. SN65DSI85-Q1 I²C Target Address Description⁽¹⁾⁽²⁾

| SN65DSI85 I ² C TARGET ADDRESS | | | | | | | |
|---|-------|-------|-------|-------|-------|-------|-------------|
| BIT 7 (MSB) | BIT 6 | BIT 5 | BIT 4 | BIT 3 | BIT 2 | BIT 1 | BIT 0 (W/R) |
| 0 | 1 | 0 | 1 | 1 | 0 | ADDR | 0/1 |

(1) When ADDR=1, Address Cycle is 0x5A (Write) and 0x5B (Read)

(2) When ADDR=0, Address Cycle is 0x58 (Write) and 0x59 (Read)

8.6.1.1 Write Procedure

The following procedure is followed to write to the SN65DSI85-Q1 I²C registers.

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI85-Q1 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The SN65DSI85-Q1 device acknowledges the address cycle.
3. The master presents the sub-address (I²C register within the SN65DSI85-Q1 device) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI85-Q1 device acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I²C register.
6. The SN65DSI85-Q1 device acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the SN65DSI85-Q1 device.
8. The master terminates the write operation by generating a stop condition (P).

8.6.1.2 Read Procedure

The following procedure is followed to read the SN65DSI85-Q1 I²C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the SN65DSI85-Q1 7-bit address and a one-value W/R bit to indicate a read cycle.
2. The SN65DSI85-Q1 device acknowledges the address cycle.
3. The SN65DSI85-Q1 device transmits the contents of the memory registers MSB-first starting at register 00h. If a write to the SN65DSI85-Q1 I²C register occurred prior to the read, then the SN65DSI85-Q1 will start at the sub-address specified in the write.
4. The SN65DSI85-Q1 device waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the SN65DSI85-Q1 device transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

8.6.1.3 Setting a Starting Sub-Address Procedure

The following procedure is followed for setting a starting sub-address for I²C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI85-Q1 7-bit address and a zero-value W/R bit to indicate a write cycle
2. The SN65DSI85-Q1 device acknowledges the address cycle.
3. The master presents the sub-address (I²C register within the SN65DSI85-Q1 device) to be written, consisting

of one byte of data, MSB-first.

4. The SN65DSI85-Q1 device acknowledges the sub-address cycle.
5. The master terminates the write operation by generating a stop condition (P).

8.6.2 Control and Status Registers Overview

Many of the SN65DSI85-Q1 functions are controlled by the Control and Status Registers (CSR). All CSR registers are accessible through the local I²C interface.

See the following tables for the SN65DSI85-Q1 CSR descriptions. Reserved or undefined bit fields should not be modified. Otherwise, the device may operate incorrectly.

8.6.3 CSR Bit

8.6.3.1 ID Registers (address = 0x00 to 0x08)

The ID registers are shown in [Figure 18](#) and described in [Table 7](#).

Figure 18. ID Registers

8.6.3.5 Video Registers

Notes:

1. TEST PATTERN GENERATION PURPOSE ONLY registers are for test pattern generation use only. Others are for normal operation unless the test pattern generation feature is enabled. CHB* registers are used only when the device is configured for two stream mode -both LVDS output channels are enabled (CSR 0x18.4 = 0) and DSI channel mode configured as two stream (CSR 0x10.6:5 = 0X10b). CH*_SYNC_DELAY_HIGH/LOW registers are not used for test pattern generation. In all other configurations, CHA* registers are used for test pattern generation.
2. The CHB* register fields with a note *This field is only applicable when CSR 0x10.6:5 = 10.* are used only when the device is configured as two stream mode with CSR 0x18.4 = 0 and CSR 0x10.6:5 = 10.

8.6.3.5.1 Address 0x20

Address 0x20 is shown in [Figure 31](#) and described in [Table 20](#).

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Video STOP and Restart Sequence

When the system requires to stop outputting video to the display, using the following sequence for the SN65DSI85-Q1 device is recommended:

1. Clear the PLL_EN bit to 0 (CSR 0x0D.0).
2. Stop video streaming on DSI inputs.
3. Drive all DSI input lanes including DSI CLK lane to LP11.

When the system is ready to restart the video streaming.

1. Start video streaming on DSI inputs.
2. Set the PLL_EN bit to 1 (CSR 0x0D.0).
3. Wait for a minimum of 3 ms.
4. Set the SOFT_RESET bit (0x09.0).

9.1.2 Reverse LVDS Pin Order Option

For ease of PCB routing, the SN65DSI85-Q1 supports swapping, or reversing, the channel or pin order through configuration register programming. The order of the LVDS pin for LVDS Channel A or Channel B can be reversed by setting the address 0x1A bit 5 CHA_REVERSE_LVDS or bit 4 CHB_REVERSE_LVDS. The LVDS Channel A and Channel B can be swapped by setting the 0x1A.6 EVEN_ODD_SWAP bit. See the corresponding register bit definition in the [Register Maps](#) section for details.

9.1.3 IRQ Usage

The SN65DSI85-Q1 device provides an IRQ pin that can indicate when certain errors occur on DSI. The IRQ output is enabled through the IRQ_EN bit (CSR 0xE0.0). Individual error conditions for DSI Channel A are enabled through the Channel A Error Enable bits (CSR 0xE1.7-2). Individual error conditions for DSI Channel B are enabled through the Channel B Error Enable bits (CSR 0xE2.7-2). The IRQ pin is asserted when an error occurs on DSI, the corresponding error enable bit is set, and the IRQ_EN bit is set. An error is cleared by writing a 1 to the corresponding error status bit.

NOTE

If the SOFT_RESET bit is set while the DSI video stream is active, some of the error status bits may be set.

NOTE

If the DSI video stream is stopped, some of the error status bits may be set. These error status bits should be cleared before restarting the video stream.

NOTE

If the DSI video stream starts before the device is configured, some of the error status bits may be set. TI recommends to start streaming after the device is correctly configured as recommended in the initialization sequence in the [Initialization Setup](#) section.

9.2 Typical Applications

9.2.1 Typical WUXGA 18-bpp Application

Figure 67 shows a typical application using the SN65DSI85-Q1 configured for a single channel DSI receiver to interface a single-channel DSI application processor to an LVDS Dual-Link 18 bit-per-pixel panel supporting 1920 x 1200 WUXGA resolutions at 60 frames per second.

Copyright © 2016, Texas Instruments Incorporated

Figure 67. Typical WUXGA 18-bpp Panel Application

9.2.1.1 Design Requirements

Table 56 lists the design parameters for SN65DSI85-Q1.

Table 56. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|---------------------------------|---------------|
| V _{CC} | 1.8 V (±5%) |
| CLOCK | DSIA_CLK |
| REFCKL Frequency | N/A |
| DSIA Clock Frequency | 490 MHz |
| PANEL INFORMATION | |
| LVDS Output Clock Frequency | 81 MHz |
| Resolution | 1920 × 1200 |
| Horizontal Active (pixels) | 960 |
| Horizontal Blanking (pixels) | 144 |
| Vertical Active (Lines) | 1200 |
| Vertical Blanking (lines) | 20 |
| Horizontal Sync Offset (pixels) | 50 |

Typical Applications (continued)

Table 56. Design Parameters (continued)

| DESIGN PARAMETER | EXAMPLE VALUE |
|---|-----------------------------------|
| Horizontal Sync Pulse Width (pixels) | 50 |
| Vertical Sync Offset (lines) | 1 |
| Vertical Sync Pulse Width (lines) | 5 |
| Horizontal Sync Pulse Polarity | Negative |
| Vertical Sync Pulse Polarity | Negative |
| Color Bit Depth (6 bpc or 8 bpc) | 6-bit |
| Number of LVDS Lanes | 2 x [3 Data lanes + 1 Clock lane] |
| DSI INFORMATION | |
| Number of DSI Lanes | 1 x [4 Data Lanes + 1 Clock Lane] |
| DSI Input Clock Frequency | 490 MHz |
| Dual DSI Configuration (Odd/Even or Left/Right) | N/A |

9.2.1.2 Detailed Design Procedure

The video resolution parameters required by the panel must be programmed into the SN65DSI85-Q1. For this example, the parameters programmed should be the following:

Horizontal active = 1920 or 0x780
CHA_ACTIVE_LINE_LENGTH_LOW = 0x80
CHA_ACTIVE_LINE_LENGTH_HIGH = 0x07

Horizontal pulse Width = 50 or 0x32
CHA_HSYNC_PULSE_WIDTH_LOW = 0x32
CHA_HSYNC_PULSE_WIDTH_HIGH = 0x00

Horizontal back porch = Horizontal blanking – (Horizontal sync offset + Horizontal sync pulse width)
Horizontal back porch = 144– (50 + 50)
Horizontal back porch = 44 or 0x2C
CHA_HORIZONTAL_BACK_PORCH = 0x2C

Vertical pulse width = 5
CHA_VSYNC_PULSE_WIDTH_LOW = 0x05
CHA_VSYNC_PULSE_WIDTH_HIGH = 0x00

The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C and configuring the following TEST PATTERN GENERATION PURPOSE ONLY registers.

Vertical active = 1200 or 0x4B0
CHA_VERTICAL_DISPLAY_SIZE_LOW = 0xB0
CHA_VERTICAL_DISPLAY_SIZE_HIGH = 0x04

Vertical back porch = Vertical blanking – (Vertical sync offset + Vertical sync pulse width)
Vertical back porch = 20: (1 + 5)
Vertical back porch = 14 or 0x0E
CHA_VERTICAL_BACK_PORCH = 0x0E

Horizontal front porch = Horizontal sync offset
Horizontal front porch = 50 or 0x32
CHA_HORIZONTAL_FRONT_PORCH = 0x32

Vertical front porch = Vertical sync offset
 Vertical front porch = 1
 CHA_VERTICAL_FRONT_PORCH = 0x01

In this example, the clock source for the SN65DSI85-Q1 is the DSI clock. When the MIPI D-PHY clock is used as the LVDS clock source, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE (CSR 0x12) must be set to the frequency range of the LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) should be set to enable the internal PLL.

LVDS_CLK_RANGE = 010b – 62.5 MHz ≤ LVDS_CLK < 87.5 MHz
 HS_CLK_SRC = 1: LVDS pixel clock derived from MIPI D-PHY channel A HS continuous clock
 DSI_CLK_DIVIDER = 00101b – Divide by 6
 CHA_DSI_LANES = 00: Four lanes are enabled
 CHA_DSI_CLK_RANGE = 0x62 – 490 MHz ≤ frequency < 495 MHz

9.2.1.3 Application Curve

SINGLE Channel DSI to DUAL Channel LVDS

1440 x 1200

Figure 68. Channel A LVDS Data Output 0 Eye Diagram

9.2.2 Typical WQXGA 24-bpp Application

Figure 69 shows a typical application using the SN65DSI85-Q1 configured for a dual-channel DSI receiver to interface a dual-channel DSI application processor to an LVDS Dual-Link 24 bit-per-pixel panel supporting 2560 x 1600 WQXGA resolutions at 60 frames per second.

Copyright © 2016, Texas Instruments Incorporated

Figure 69. Typical WQXGA 24-bpp Panel Application

9.2.2.1 Design Requirements

Table 57 lists the design parameters for SN65DSI85-Q1.

Table 57. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|----------------------------------|-----------------------------------|
| V _{CC} | 1.8 V (±5%) |
| PANEL INFORMATION | |
| LVDS Output Clock Frequency | 154 MHz |
| Resolution | 2560 x 1600 |
| Color Bit Depth (6 bpc or 8 bpc) | 8-bit |
| Number of LVDS Lanes | 2 x [4 Data lanes + 1 Clock lane] |
| DSI INFORMATION | |
| Number of DSI Lanes | 2 x [4 Data Lanes + 1 Clock Lane] |
| DSI Input Clock Frequency | 500 MHz |

10 Power Supply Recommendations

10.1 V_{CC} Power Supply

Each V_{CC} power supply pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI85-Q1 device. TI recommends to have one bulk capacitor (1 μ F to 10 μ F) on the supply. TI also recommends to have the pins connected to a solid power plane.

10.2 V_{CORE} Power Supply

This pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI85-Q1 device. TI recommends to have one bulk capacitor (1 μ F to 10 μ F) on the supply. TI also recommends to have the pins connected to a solid power plane.

11 Layout

11.1 Layout Guidelines

11.1.1 Package Specific

For the PAP package, to minimize the power supply noise floor, provide good decoupling near the SN65DSI85-Q1 device power pins. The use of four ceramic capacitors (2 \times 0.1 μ F and 2 \times 0.01 μ F) provides good performance. At the least, TI recommends to install one 0.1- μ F and one 0.01- μ F capacitor near the SN65DSI85-Q1 device. To avoid large current loops and trace inductance, the trace length between decoupling capacitor and device power inputs pins must be minimized. Placing the capacitor underneath the SN65DSI85-Q1 device on the bottom of the PCB is often a good choice.

11.1.2 Differential pairs

- Differential pairs must be routed with controlled 100- Ω differential impedance (\pm 20%) or 50- Ω single-ended impedance (\pm 15%).
- Keep away from other high speed signals.
- Keep lengths to within 5 mils of each other.
- Length matching must be near the location of mismatch.
- Each pair must be separated at least by 3 times the signal trace width.
- The use of bends in differential traces must be kept to a minimum. When bends are used, the number of left and right bends must be as equal as possible and the angle of the bend must be \geq 135 degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
- Route all differential pairs on the same of layer.
- The number of vias must be kept to a minimum. TI recommends to keep the via count to 2 or less.
- Keep traces on layers adjacent to ground plane.
- Do NOT route differential pairs over any plane split.
- Adding test points causes impedance discontinuity and therefore negatively impacts signal performance. If test points are used, they must be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.

11.1.3 Ground

TI recommends that only one board ground plane be used in the design which provides the best image plane for signal traces running above the plane. The thermal pad of the SN65DSI85-Q1 must be connected to this plane with vias.

11.2 Layout Example

13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|---------|
| SN65DSI85TPAPRQ1 | ACTIVE | HTQFP | PAP | 64 | 1000 | RoHS & Green | NIPDAU | Level-3-260C-168 HR | -40 to 105 | DSI85TQ1 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
