

EVM User's Guide: TPSM81033EVM-035

TPSM81033EVM-035 Evaluation Module

Description

The TPSM81033EVM-035 is designed to provide a quick setup to evaluate TPSM81033 device with the output voltage setting to 5V.

The TPSM81033 is a synchronous boost module. The device provides a power supply design for portable equipment and smart devices powered by various batteries and other power supply. The TPSM81033 has 2A (typical) valley switch current limit over full temperature range.

Features

- Input voltage range: 1.8V to 5.5V
- Output voltage range: 2.2V to 5.5V
- Pin-selectable auto PFM or forced PWM mode at light load
- True disconnection between input and output during shutdown

Applications

- [Optical module](#)
- [Patient monitor](#)
- [Smart meter](#)

1 Evaluation Module Overview

1.1 Introduction

The TPSM81033 uses adaptive constant on-time valley-current-control topology to regulate the output voltage and operates at 2.4MHz switching frequency.

This user's guide describes the characteristics and operation of the evaluation module TPSM81033EVM-035. This document provides instructions on how to use the evaluation module. Throughout this document, the terms of evaluation board, evaluation module, and EVM are synonymous with the TPSM81033EVM-035. This document also includes a schematic, reference printed circuit board (PCB) layout, and a complete bill of materials (BOM).

1.2 Kit Contents

Table 1-1 lists the contents of the EVM kit. Contact the Texas Instruments Product Information Center nearest you if any components are missing. TI highly recommends that users check the TI website at <https://www.ti.com> to verify that the latest versions of the related software is being used.

Table 1-1. Kit Contents

Item	Quantity
TPSM81033EVM	1
TPSM81033QFN-FCMOD	1

1.3 Specification

Table 1-2 provides a summary of the TPSM81033EVM performance characteristics.

Table 1-2. Performance Specification

Tested at 25°C ambient temperature

TEST CONDITIONS		MIN	TYP	MAX	UNIT
Input voltage			3.6		V
Output voltage	TPSM81033EVM, $V_{IN} = 3.6V$		5.0		V
Output current	$V_{IN} = 3.6V$		1		A

1.4 Device Information

There are two optional modes at light load by configuring the MODE pin: auto PFM mode and forced PWM to balance the efficiency and noise immunity in light load. The TPSM81033 consumes a 20 μ A quiescent current from VIN at light load condition. During shutdown, the TPSM81033 is completely disconnected from the input power and only consumes a 0.1 μ A current to achieve long battery life. The TPSM81033 has 5.75V output overvoltage protection, output short circuit protection, and thermal shutdown protection.

The TPSM81033 offers a very small solution-size with 2.6mm \times 2.5mm QFN-FCMOD (8) package and minimum amount of external components.

2 Hardware

2.1 Setup

This section describes how to properly connect, set up, and use the TPSM81033EVM-035.

2.1.1 Input/Output Connector Descriptions

Reference Designator	Description
J1-VIN	Positive input connection from the input supply for the EVM.
J2-VOUT	Positive connection for the output voltage.
J3-GND	Return connection for the input voltage.
J4-GND	Return connection for the output voltage.
TP1-VIN, TP4-GND	Input voltage sensing for measuring efficiency. PVIN_S+ is for positive input and PVIN_S- is for negative input.
TP2-VOUT, TP5-GND	Output voltage sensing for measuring efficiency. VOUT_S+ is for output positive node and VOUT_S- is for output negative node.
J5-PG	Test point to measure PG pin waveform.
JP1-MODE	MODE pin input jumper.
JP2-EN	EN pin input jumper. Place a jumper across EN and AVIN to turn on the IC. Place a jumper across EN and GND to turn off the IC.
TP3-AUX	Test point to measure AUX pin voltage.

2.1.2 Modification

The EVM is designed to support some modifications by the user. The external component can be changed according to the real application.

2.1.3 Input Capacitor

A 150 μ F tantalum capacitor C2, is added as the input capacitor in the EVM, The ESR of the tantalum capacitor is 0.1 Ω , to damp the ringing of the input voltage when the EVM is powered by a power supply with a long cable. The capacitor is not required for proper operation and can be removed in a real application.

2.1.4 Output Capacitor

4*22 μ F ceramic capacitors are used in the EVM, the effective capacitor value is approximately 20 μ F. If the load current is smaller than 1A, then 2*22 μ F ceramic capacitor (effective capacitor value is approximately 10 μ F) is also proper.

2.1.5 Feedforward Capacitor

A feed-forward capacitor C11 can help to improve the response performance and the phase margin if the value is properly selected. Refer to this application note to select the feed-forward capacitor if required. [Feedforward Capacitor Makes Boost Converter Fast and Stable](#).

3 Hardware Design Files

3.1 Schematic

Figure 3-1 is the EVM schematic.
