TLV7011, TLV7021, TLV7012, TLV7022

SLVSDM5F – SEPTEMBER 2017 – REVISED MARCH 2020

TLV701x and TLV702x Small-Size, Low-Power, Low-Voltage Comparators

1 Features

- Ultra-small packages: X2SON (0.8×0.8 mm^2) , WSON (2×2 mm^2)
- Standard packages: SOT23, SC70, VSSOP
- Wide supply voltage range of 1.6 V to 6.5 V
- Quiescent supply current of 5 µA
- Low propagation delay of 260 ns
- Rail-to-rail common-mode input voltage
- Internal hysteresis
- Push-pull and open-drain output options
- No phase reversal for over driven inputs
- –40°C to 125°C Operating ambient temperature

2 Applications

- Mobile phones and tablets
- Portable and battery-powered devices
- IR receivers
- Level translators
- Threshold detectors and discriminators
- Window comparators
- Zero-crossing detectors

3 Description

The TLV7011/7021 (single-channel) and TLV7012/7022 (dual-channel) are micro-power comparators that feature low-voltage operation with rail-to-rail input capability. These comparators are available in an ultra-small, leadless package measuring 0.8 mm × 0.8 mm and standard leaded packages, making them applicable for space-critical designs like smartphones and other portable or battery-powered applications.

The TLV701x and TLV702x offer an excellent speed-to-power combination with a propagation delay of 260 ns and a quiescent supply current of 5 µA. This combination of fast response time at micropower enables power conscious systems to monitor and respond quickly to fault conditions. With an operating voltage range of 1.6 V to 6.5 V, these comparators are compatible with 3-V and 5-V systems.

These comparators also feature no output phase inversion with overdriven inputs and internal hysteresis. These features make this family of comparators well suited for precision voltage monitoring in harsh, noisy environments where slow-moving input signals must be converted into clean digital outputs.

The TLV701x have push-pull output stages capable of sinking and sourcing milliamps of current when controlling an LED or driving a capacitive load. The TLV702x have open-drain output stages that can be pulled beyond V_{CC}, making it appropriate for level translators and bipolar to single-ended converters.
Device Information[1]

PART NUMBERS	PACKAGE (PINS)	BODY SIZE (NOM)
TLV7011, TLV7021	X2SON (5)	0.80 mm × 0.80 mm
	SC70 (5)	2.00 mm × 1.25 mm
	SOT-23 (5)	2.90 mm × 1.60 mm
TLV7012, TLV7022	VSSOP (8)	3 mm × 3 mm
	SOT-23 (8)	2.90 mm × 1.60 mm
	WSON (8)	2 mm x 2 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

TLV70x1 Family of Low Power Comparators

PART NUMBERS	OUTPUT	I_Q	t_{PD}
TLV701x / 2x	Push-pull / Open-drain	5 µA	260 ns
TLV703x / 4x	Push-pull / Open-drain	335 nA	3 µs

X2SON Package vs SC70 and US Dime

US dime (18x18x1.35 mm3)
5-Lead SC70
5-Pin X2SON

Propagation Delay vs. Overdrive

T_A = 25°C, V_{CC} = 5 V, C_L = 15 pF

6 Specifications

6.1 Absolute Maximum Ratings (Single)

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply voltage ($V_S = V_{CC} - V_{EE}$)			6	V
Input pins (IN+, IN–)[2]		$V_{EE} - 0.3$	6	V
Current into Input pins (IN+, IN–)[2]			±10	mA
Output (OUT)	TLV7011/7012[3]	$V_{EE} - 0.3$	$V_{CC} + 0.3$	V
	TLV7021/7022	$V_{EE} - 0.3$	6	
Output short-circuit duration[4]			10	s
Junction temperature, T_J			150	°C
Storage temperature, T_{stg}		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Input terminals are diode-clamped to V_{EE}. Input signals that can swing 0.3V below V_{EE} must be current-limited to 10mA or less.
(3) Output maximum is ($V_{CC} + 0.3$V) or 6V, whichever is less.
(4) Short-circuit to ground, one comparator per package.

6.2 Absolute Maximum Ratings (Dual)

over operating free-air temperature range (unless otherwise noted)[1]

	MIN	MAX	UNIT
Supply voltage $V_S = V_{CC} - V_{EE}$	−0.3	7	V
Input pins (IN+, IN-)[2]	$V_{EE} - 0.3$	7	V
Current into Input pins (IN+, IN-)		±10	mA
Output (OUT) (TLV7012)[3]	$V_{EE} - 0.3$	$V_{CC} + 0.3$	V
Output (OUT) (TLV7022)	$V_{EE} - 0.3$	7	V
Output short-circuit duration[4]		10	s
Junction temperature, T_J		150	°C
Storage temperature, T_{stg}	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Input terminals are diode-clamped to V_{EE}. Input signals that can swing 0.3V below V_{EE} must be current-limited to 10mA or less
(3) Output maximum is ($V_{CC} + 0.3$ V) or 7 V, whichever is less.
(4) Short-circuit to ground, one comparator per package.

6.3 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.4 Recommended Operating Conditions (Single)

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Supply voltage ($V_S = V_{CC} - V_{EE}$)	1.6		5.5	V
Input Voltage Range	$V_{EE} - 0.1$		$V_{CC} + 0.2$	V
Ambient temperature, T_A	−40		125	°C

Product Folder Links: *TLV7011 TLV7021 TLV7012 TLV7022*

6.5 Recommended Operating Conditions (Dual)

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage $V_S = V_{CC} - V_{EE}$	1.6	6.5	V
Input voltage range	$V_{CC} - 0.1$	$V_{EE} + 0.2$	V
Ambient temperature, T_A	−40	125	°C

6.8 Electrical Characteristics (Single)

V_S = 1.8 V to 5 V, V_{CM} = V_S / 2; minimum and maximum values are at T_A = –40°C to +125°C (unless otherwise noted).
Typical values are at T_A = 25°C.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IO}	Input offset voltage	V_S = 1.8 V and 5 V, V_{CM} = V_S / 2		±0.5	±8	mV
V_{HYS}	Hysteresis	V_S = 1.8 V and 5 V, V_{CM} = V_S / 2	1.2	4.2	14	mV
V_{CM}	Common-mode voltage range	V_S = 2.5 V to 5 V	V_{EE}		V_{CC} + 0.1	V
		V_S = 1.8 V to 2.5 V	V_{EE} + 0.1		V_{CC} + 0.1	
I_B	Input bias current			5		pA
I_{OS}	Input offset current			1		pA
V_{OH}	Output voltage high (for TLV7011 only)	V_S = 5 V, I_O = 3 mA	4.7	4.8		V
V_{OL}	Output voltage low	V_S = 5 V, I_O = 3 mA		120	220	mV
I_{LKG}	Open-drain output leakage current (TLV7021 only)	V_S = 5 V, V_{ID} = +0.1 V (output high), V_{PULLUP} = V_{CC}		100		pA
CMRR	Common-mode rejection ratio	V_{EE} < V_{CM} < V_{CC}, V_S = 5 V		78		dB
PSRR	Power supply rejection ratio	V_S = 1.8 V to 5 V, V_{CM} = V_S / 2		78		dB
I_{SC}	Short-circuit current	V_S = 5 V, sourcing		65		mA
		V_S = 5 V, sinking		44		
I_{CC}	Supply current	V_S = 1.8 V, no load, V_{ID} = –0.1 V (Output Low)		5	10	µA

6.9 Switching Characteristics (Single)

Typical values are at T_A = 25°C, V_{CC} = 5 V, V_{CM} = 2.5 V; C_L = 15 pF, input overdrive = 100 mV (unless otherwise noted).

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PHL}	Propagation delay time, high-to-low (R_P = 2.5 kΩ TLV7021 only)	Midpoint of input to midpoint of output, V_{OD} = 100 mV		260		ns
t_{PLH}	Propagation delay time, low-to-high (R_P = 2.5 kΩ TLV7021 only)	Midpoint of input to midpoint of output, V_{OD} = 100 mV		310		ns
t_R	Rise time (for TLV7011 only)	20% to 80%		5		ns
t_F	Fall time	80% to 20%		5		ns
t_{ON}	Power-up time [1]			20		µs

(1) During power on, V_S must exceed 1.6 V for t_{ON} before the output tracks the input.

6.10 Electrical Characteristics (Dual)

V_S = 1.8 V to 5 V, V_{CM} = V_S / 2; minimum and maximum values are at T_A = –40°C to +125°C (unless otherwise noted). Typical values are at T_A = 25°C.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IO}	Input Offset Voltage	V_S = 1.8 V and 5 V, V_{CM} = VS / 2		±0.1	±8	mV
V_{HYS}	Hysteresis	V_S = 1.8 V and 5 V, V_{CM} = VS / 2	2	7.2	15	mV
V_{CM}	Common-mode voltage range		V_{EE}		V_{CC} + 0.1	V
I_B	Input bias current			2		pA
I_{OS}	Input offset current			1		pA
V_{OH}	Output voltage high (for TLV7012 only)	V_S = 5 V, V_{EE} = 0 V, I_O = 3 mA	4.65	4.8		V
V_{OL}	Output voltage low	V_S = 5 V, V_{EE} = 0 V, I_O = 3 mA		250	350	mV
I_{LKG}	Open-drain output leakage current (TLV7022 only)	V_S = 5 V, V_{ID} = +0.1 V (output high), $V_{PULLUP} = V_{CC}$		100		pA
CMRR	Common-mode rejection ratio	$V_{EE} < V_{CM} < V_{CC}$, V_S = 5 V		73		dB
PSRR	Power supply rejection ratio	V_S = 1.8 V to 5 V, V_{CM} = V_S / 2		77		dB
I_{SC}	Short-circuit current	VS = 5 V, sourcing (for TLV7012 only)		29		mA
		VS = 5 V, sinking		33		
I_{CC}	Supply current / Channel	V_S = 1.8 V, no load, V_{ID} = –0.1 V (Output Low)		4.7	9	μA

6.11 Switching Characteristics (Dual)

Typical values are at T_A = 25°C, V_S = 5 V, V_{CM} = V_S / 2; CL = 15 pF, input overdrive = 100 mV (unless otherwise noted).

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PHL}	Propagation delay time, high to-low (RP = 4.99 kΩ TLV7022 only) [1]	Midpoint of input to midpoint of output, V_{OD} = 100 mV		310		ns
t_{PLH}	Propagation delay time, low-to high (RP = 4.99 kΩ TLV7022 only) [1]	Midpoint of input to midpoint of output, V_{OD} = 100 mV		260		ns
t_R	Rise time (TLV7012 only)	Measured from 20% to 80%		5		ns
t_F	Fall time	Measured from 20% to 80%		5		ns
t_{ON}	Power-up time	During power on, V_{CC} must exceed 1.6V for 20 μs before the output is in a correct state.		20		μs

(1) The lower limit for RP is 650 Ω

7 Detailed Description

7.1 Overview

The TLV701x and TLV702x devices are single-channel, micro-power comparators with push-pull and open-drain outputs. Operating down to 1.6 V and consuming only 5 µA, the TLV701x and TLV702x are ideally suited for portable and industrial applications. The comparators are available in leadless and leaded packages to offer significant board space saving in space-challenged designs.

7.2 Functional Block Diagram
Copyright © 2017, Texas Instruments Incorporated

7.3 Feature Description

The TLV701x (push-pull) and TLV702x (open-drain) devices are micro-power comparators that are capable of operating at low voltages. The TLV701x and TLV702x feature a rail-to-rail input stage capable of operating up to 100 mV beyond the VCC power supply rail. The comparators also feature a push-pull and open-drain output stage with internal hysteresis.

7.4 Device Functional Modes

The TLV701x and TLV702x have a Power-on-Reset (POR) circuit. While the power supply (V_S) is ramping up or ramping down, the POR circuitry will be activated.

For the TLV701x, the POR circuit will hold the output low (at V_{EE}) while activated.

For the TLV702x, the POR circuit will keep the output high impedance (logical high) while activated.

When the supply voltage is greater than, or equal to, the minimum supply voltage, the comparator output reflects the state of the differential input (V_{ID}).

7.4.1 Inputs

The TLV701x and TLV702x input common-mode extends from V_{EE} to 100 mV above V_{CC}. The differential input voltage (V_{ID}) can be any voltage within these limits. No phase-inversion of the comparator output will occur when the input pins exceed V_{CC} and V_{EE}.

Device Functional Modes (continued)

While TI recommends operating the TLV701x and TLV702x within the specified common-mode range, the inputs are fault tolerant to voltages up to 5.5 V independent of the applied V_{CC} value. Fault tolerant is defined as maintaining the same high input impedance when V_{CC} is unpowered or within the recommended operating range. Because the inputs of the TLV701x and TLV702x are fault tolerant, the inputs to the comparator can be any value between 0 V and 5.5 V while V_{CC} is ramping up. This feature allows any supply and input driven sequence as long as the input value and supply are within the specified ranges. In this case, no current limiting resistor is required. This is possible since the V_{CC} is isolated from the inputs such that it maintains its value even when a higher voltage is applied to the input.

The input bias current is typically 1 pA for input voltages between V_{CC} and V_{EE}. The comparator inputs are protected from undervoltage by internal diodes connected to V_{EE}. As the input voltage goes under V_{EE}, the protection diodes become forward biased and begin to conduct causing the input bias current to increase exponentially. Input bias current typically doubles for 10°C temperature increases.

7.4.2 Internal Hysteresis

The device hysteresis transfer curve is shown in Figure 32. This curve is a function of three components: V_{TH}, V_{OS}, and V_{HYST}:

- V_{TH} is the actual set voltage or threshold trip voltage.
- V_{OS} is the internal offset voltage between V_{IN+} and V_{IN-}. This voltage is added to V_{TH} to form the actual trip point at which the comparator must respond to change output states.
- V_{HYST} is the internal hysteresis (or trip window) that is designed to reduce comparator sensitivity to noise (4.2 mV for the TLV7011).

$$V_{TH} + V_{OS} - (V_{HYST} / 2) \qquad V_{TH} + V_{OS} \qquad V_{TH} + V_{OS} + (V_{HYST} / 2)$$
Figure 32. Hysteresis Transfer Curve

7.4.3 Output

The TLV701x feature a push-pull output stage eliminating the need for an external pull-up resistor. On the other hand, the TLV702x feature an open-drain output stage enabling the output logic levels to be pulled up to an external source independent of the supply voltage.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TLV701x and TLV702x are micro-power comparators with reasonable response time. The comparators have a rail-to-rail input stage that can monitor signals beyond the positive supply rail with integrated hysteresis. When higher levels of hysteresis are required, positive feedback can be externally added. The push-pull output stage of the TLV701x is optimal for reduced power budget applications and features no shoot-through current. When level shifting or wire-ORing of the comparator outputs is needed, the TLV702x with its open-drain output stage is well suited to meet the system needs. In either case, the wide operating voltage range, low quiescent current, and micro-package of the TLV701x and TLV702x make these comparators excellent candidates for battery-operated and portable, handheld designs.

8.1.1 Inverting Comparator With Hysteresis for TLV701x

The inverting comparator with hysteresis requires a three-resistor network that is referenced to the comparator supply voltage (V_{CC}), as shown in Figure 33. When V_{IN} at the inverting input is less than V_A, the output voltage is high (for simplicity, assume V_O switches as high as V_{CC}). The three network resistors can be represented as R1 || R3 in series with R2. Equation 1 defines the high-to-low trip voltage (V_{A1}).

$$V_{A1} = V_{CC} \times \frac{R2}{(R1 \parallel R3) + R2}$$
(1)

When V_{IN} is greater than V_A, the output voltage is low, very close to ground. In this case, the three network resistors can be presented as R2 || R3 in series with R1. Use Equation 2 to define the low to high trip voltage (V_{A2}).

$$V_{A2} = V_{CC} \times \frac{R2 \parallel R3}{R1 + (R2 \parallel R3)}$$
(2)

Equation 3 defines the total hysteresis provided by the network.

$$\Delta V_A = V_{A1} - V_{A2}$$

Application Information (continued)

8.1.2 Noninverting Comparator With Hysteresis for TLV701x

A noninverting comparator with hysteresis requires a two-resistor network, as shown in Figure 34, and a voltage reference (V_{REF}) at the inverting input. When V_{IN} is low, the output is also low. For the output to switch from low to high, V_{IN} must rise to V_{IN1}. Use Equation 4 to calculate V_{IN1}.

$$V_{IN1} = R1 \times \frac{V_{REF}}{R2} + V_{REF}$$

(4)

When V_{IN} is high, the output is also high. For the comparator to switch back to a low state, V_{IN} must drop to V_{IN2} such that V_A is equal to V_{REF}. Use Equation 5 to calculate V_{IN2}.

$$V_{IN2} = \frac{V_{REF} (R1 + R2) - V_{CC} \times R1}{R2}$$

(5)

The hysteresis of this circuit is the difference between V_{IN1} and V_{IN2}, as shown in Equation 6.

$$\Delta V_{IN} = V_{CC} \times \frac{R1}{R2}$$

8.2 Typical Applications

8.2.1 Window Comparator

Window comparators are commonly used to detect undervoltage and overvoltage conditions. Figure 35 shows a simple window comparator circuit.
Figure 35. Window Comparator

8.2.1.1 Design Requirements

For this design, follow these design requirements:
* Alert (logic low output) when an input signal is less than 1.1 V
* Alert (logic low output) when an input signal is greater than 2.2 V
* Alert signal is active low
* Operate from a 3.3-V power supply

8.2.1.2 Detailed Design Procedure

Configure the circuit as shown in Figure 35. Connect V_{CC} to a 3.3-V power supply and V_{EE} to ground. Make R1, R2 and R3 each 10-MΩ resistors. These three resistors are used to create the positive and negative thresholds for the window comparator (V_{TH+} and V_{TH-}). With each resistor being equal, V_{TH+} is 2.2 V and V_{TH-} is 1.1 V. Large resistor values such as 10-MΩ are used to minimize power consumption. The sensor output voltage is applied to the inverting and noninverting inputs of the two TLV702x's. The TLV7021 is used for its open-drain output configuration. Using the TLV702x allows the two comparator outputs to be Wire-Ored together. The respective comparator outputs will be low when the sensor is less than 1.1 V or greater than 2.2 V. V_{OUT} will be high when the sensor is in the range of 1.1 V to 2.2 V.

Typical Applications (continued)

Figure 36. Window Comparator Results

8.2.2 IR Receiver Analog Front End

A single TLV7011 device can be used to build a complete IR receiver analog front end (AFE). The nanoamp quiescent current and low input bias current make it possible to be powered with a coin cell battery, which could last for years.
Copyright © 2017, Texas Instruments Incorporated

Figure 37. IR Receiver Analog Front End Using TLV7011

Typical Applications (continued)

8.2.2.1 Design Requirements

For this design, follow these design requirements:
- Use a proper resistor (R_1) value to generate an adequate signal amplitude applied to the inverting input of the comparator.
- The low input bias current I_B (2 pA typical) ensures that a greater value of R1 to be used.
- The RC constant value (R_2 and C_1) must support the targeted data rate (that is, 9,600 bauds) to maintain a valid tripping threshold.
- The hysteresis introduced with R_3 and R_4 helps to avoid spurious output toggles.

8.2.2.2 Detailed Design Procedure

The IR receiver AFE design is highly streamlined and optimized. R_1 converts the IR light energy induced current into voltage and applies to the inverting input of the comparator. Because a reverse biased IR LED is used as the IR receiver, a higher I/V transimpedance gain is required to boost the amplitude of reduced current. A 10M resistor is used as R_1 to support a 1-V, 100-nA transimpedance gain. This is made possible with the picoamps Input bias current I_B (5pA typical). The RC network of R_2 and C_1 establishes a reference voltage V_{ref} which tracks the mean amplitude of the IR signal. The RC constant of R_2 and C_1 (about 4.7 ms) is chosen for V_{ref} to track the received IR current fluctuation but not the actual data bit stream. The noninverting input is connected to V_{ref} and the output over the R_3 and R_4 resistor network which provides additional hysteresis for improved guard against spurious toggles.

To reduce the current drain from the coin cell battery, data transmission must be short and infrequent.

8.2.2.3 Application Curve
Figure 38. IR Receiver AFE Waveforms

Typical Applications (continued)

8.2.3 Square-Wave Oscillator

Square-wave oscillator can be used as low cost timing reference or system supervisory clock source.
Figure 39. Square-Wave Oscillator

8.2.3.1 *Design Requirements*

The square-wave period is determined by the RC time constant of the capacitor and resistor. The maximum frequency is limited by propagation delay of the device and the capacitance load at the output. The low input bias current allows a lower capacitor value and larger resistor value combination for a given oscillator frequency, which may help to reduce BOM cost and board space.

8.2.3.2 *Detailed Design Procedure*

The oscillation frequency is determined by the resistor and capacitor values. The following calculation provides details of the steps.
Figure 40. Square-Wave Oscillator Timing Thresholds

First consider the output of Figure Figure 39 is high which indicates the inverted input V_C is lower than the noninverting input (V_A). This causes the C_1 to be charged through R_4, and the voltage V_C increases until it is equal to the noninverting input. The value of V_A at the point is calculated by Equation 7.

$$V_{A1} = \frac{V_{CC} \times R_2}{R_2 + R_1 \| R_3}$$

(7)

if $R_1 = R_2 = R_3$, then $V_{A1} = 2\ V_{CC} / 3$

Typical Applications (continued)

At this time the comparator output trips pulling down the output to the negative rail. The value of V_A at this point is calculated by Equation 8.

$$V_{A2} = \frac{V_{CC}(R_2 \| R_3)}{R_1 + R_2 \| R_3}$$

(8)

if $R_1 = R_2 = R_3$, then $V_{A2} = V_{CC}/3$

The C_1 now discharges though the R_4, and the voltage V_{CC} decreases until it reaches V_{A2}. At this point, the output switches back to the starting state. The oscillation period equals to the time duration from for C_1 from $2V_{CC}/3$ to V_{CC} / 3 then back to $2V_{CC}/3$, which is given by $R_4 C_1 \times \ln 2$ fro each trip. Therefore, the total time duration is calculated as $2 R_4 C_1 \times \ln 2$. The oscillation frequency can be obtained by Equation 9:

$$f = 1/(2 \ R4 \times C1 \times \ln 2)$$

(9)

8.2.3.3 Application Curve

Figure 41 shows the simulated results of tan oscillator using the following component values:

- $R_1 = R_2 = R_3 = R_4 = 100 \ k\Omega$
- $C_1 = 100 \ pF$, $C_L = 20 \ pF$
- V+ = 5 V, V− = GND
- C_{stray} (not shown) from V_A TO GND = 10 pF
Figure 41. Square-Wave Oscillator Output Waveform

Product Folder Links: *TLV7011 TLV7021 TLV7012 TLV7022*

9 Power Supply Recommendations

The TLV701x and TLV702x have a recommended operating voltage range (V_S) of 1.6 V to 5.5 / 6.5 V. V_S is defined as $V_{CC} - V_{EE}$. Therefore, the supply voltages used to create V_S can be single-ended or bipolar. For example, single-ended supply voltages of 5 V and 0 V and bipolar supply voltages of +2.5 V and −2.5 V create comparable operating voltages for V_S. However, when bipolar supply voltages are used, it is important to realize that the logic low level of the comparator output is referenced to V_{EE}.

Output capacitive loading and output toggle rate will cause the average supply current to rise over the quiescent current.

10 Layout

10.1 Layout Guidelines

To reduce PCB fabrication cost and improve reliability, TI recommends using a 4-mil via at the center pad connected to the ground trace or plane on the bottom layer.

A power-supply bypass capacitor of 100 nF is recommended when supply output impedance is high, supply traces are long, or when excessive noise is expected on the supply lines. Bypass capacitors are also recommended when the comparator output drives a long trace or is required to drive a capacitive load. Due to the fast rising and falling edge rates and high-output sink and source capability of the TLV7011 and TLV7021 output stages, higher than normal quiescent current can be drawn from the power supply. Under this circumstance, the system would benefit from a bypass capacitor across the supply pins.

11.3   Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4   Community Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.5   Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.6   Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature
   number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown
   on this view. It is recommended that vias under paste be filled, plugged or tented.
