

# TPS25984Bx 4.5V–16V, 0.8mΩ, 70A Stackable Integrated Hotswap (eFuse) With Accurate and Fast Current Monitor

## 1 Features

- Input operating voltage range: 4.5V to 16V
  - Absolute maximum: 20V DC, 23.5V transient
  - Withstands negative voltages up to –1V output
- Integrated FET, ultra-low  $R_{DS(ON)}$ : 0.8mΩ (typ)
- Rated RMS current: 55A; peak current: 70A
- Supports parallel connection of multiple eFuses for higher current support
  - Current balancing during start-up
- Robust overcurrent protection
  - Adjustable overcurrent threshold ( $I_{OCP}$ ): 10A to 80A with accuracy of  $\pm 5\%$
  - Circuit-breaker response during steady-state operation with internal transient overcurrent blanking timer to support peak currents
  - Adjustable active current limit in start-up ( $I_{LIM}$ )
- Robust short-circuit protection
  - Fast-trip response (<200ns) to output short-circuit events
  - Adjustable ( $2 \times I_{OCP}$ ) and fixed thresholds
  - Immune to supply line transients — no nuisance tripping
- Precise analog load current monitoring
  - Accuracy:  $\pm 1.4\%$ ; bandwidth: >500kHz
- Fast overvoltage protection (fixed 18.4V threshold)
- Adjustable output slew rate control (dV/dt) for inrush current protection
- Active high enable input with adjustable undervoltage lockout (UVLO)
- Overtemperature protection (OTP)
  - FET SOA: 10W/√s
- Integrated FET health monitoring and reporting
- Analog die temperature monitor output (TEMP)
- Dedicated fault indication pin (GOK/FLT)
- Power-Good indication pin (PG)
- Small footprint: QFN-32, 5mm × 5mm
- 100% Pb free

## 2 Applications

- Input hotswap and hotplug
- Server and high performance computing
- Network interface cards
- Graphics and Hardware accelerator cards
- Data center switches and routers
- Fan trays

## 3 Description

The TPS25984Bx is a high-current, stackable integrated hotswap protection (eFuse) device in a small package. The device provides multiple protection modes using very few external components and is a robust defense against overloads, short circuits, and excessive inrush current.

Applications with particular inrush current requirements can set the output slew rate with a single external capacitor. Output current limit level can be set by user as per system needs. Internal overcurrent blanking timer allows systems to support transient peaks in the load current without tripping the eFuse.

Multiple TPS25984Bx devices can be stacked in parallel to increase the total current capacity for high power systems. All devices share current during start-up to avoid over-stressing some of the devices which can result in premature or partial shutdown of the parallel chain.

An integrated fast and accurate sense analog load current monitor facilitates predictive maintenance and advanced dynamic platform power management techniques such as Intel® PSYS and PROCHOT™ to maximize system throughput and power supply utilization.

The devices are characterized for operation over a junction temperature range of –40°C to +125°C.

Simplified Schematic

## Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
TPS25984B0RZJ	RZJ (QFN, 32)	5mm × 5mm
TPS25984B1RZJ		
TPS25984B2RZJ		
TPS25984B3RZJ		

- (1) For all available packages, see Section 11.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

TPS25984B2RZJ	Configurable based on MODE pin	
TPS25984B3RZJ	Latch off	3.2ms (typ)

## 5 Pin Configuration and Functions

Figure 5-1. TPS25984Bx RZJ Package, 32-pin QFN (Top View)

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
OUT	1, 2, 25, 26, 27, 28, 29, 30, 31, 32	O	Power output. Must be soldered to output power plane uniformly to ensure proper heat dissipation and to maintain optimal current distribution through the device.
D_OC	3	O	Open-drain signal to indicate overcurrent event.
EN/UVLO	4	I	Active high enable input. Connect resistor divider from input supply to set the undervoltage threshold. <i>Do not leave floating.</i>
GOK/FLT	5	I/O	Open-drain active low fault indication. Also acts as an input for synchronizing faults between parallel devices. <i>Do not leave floating.</i>
PG	6	O	Open-drain active high Power Good indication. This pin is recommended to be pulled up externally to a logic level supply.
NC	7	N/A	No connect. Can be left floating or connected to input supply.
MODE	8	I	TPS25984B2: Retry mode selection pin.
DNC			TPS25984B0/1/3: Do not connect anything to this pin.
IN	9, 10, 11, 12, 13, 14, 15, 16, Exposed Pad	P	Power input. Must be soldered to input power plane uniformly to ensure proper heat dissipation and to maintain optimal current distribution through the device.

**Table 5-1. Pin Functions (continued)**

PIN		TYPE	DESCRIPTION
NAME	NO.		
DNC	17	I/O	Internal test mode pin. Do not force a voltage on this pin externally.
TEMP	18	O	Die junction temperature monitor analog voltage output. Can be tied together with TEMP outputs of multiple devices in a parallel configuration to indicate the peak temperature of the chain.
DVDT	19	O	Start-up output slew rate control pin. Leave this pin open to allow fastest start-up. Connect capacitor to ground to slow down the slew rate to manage inrush current.
GND	20	G	Device ground reference pin. Connect to system ground.
VREG	21	O	Internal LDO output. Decouple with a capacitor to GND.
IMON	22	O	An external resistor from this pin to GND sets the voltage gain for the analog output load current monitor signal during steady-state.
ILIM	23	O	An external resistor from this pin to GND sets the current limit threshold during start-up as well as circuit-breaker and fast-trip threshold during steady-state. This pin also acts as analog load current monitor during start-up and steady-state. <i>Do not leave floating.</i>
IREF	24	I/O	Reference voltage for overcurrent and short-circuit protection blocks. Can be generated using internal current source and resistor on this pin, or can be driven from external voltage source. <i>Do not leave floating.</i>

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

Parameter		Pin	MIN	MAX	UNIT
V <sub>INMAX</sub>	Maximum Input Voltage Range	IN	-0.3	20	V
V <sub>INMAX,PLS</sub>	Maximum Input Voltage Range (10μs, T <sub>A</sub> ≥ 0°C)	IN	-0.3	Min(23.5, V <sub>OUT</sub> + 23)	V
V <sub>INMAX,SLEW</sub>	Maximum Slew Rate at Input Pin	IN		30	V/μs
V <sub>OUTMAX</sub>	Maximum Output Voltage Range	OUT	-1	Min(20, V <sub>IN</sub> + 0.3)	
V <sub>IREFMAX</sub>	Maximum IREF Pin Voltage Range	IREF		5.5	V
V <sub>DVDTMAX</sub>	Maximum DVDT Pin Voltage Range	DVDT		5.5	V
V <sub>MODEMAX</sub>	Maximum MODE Pin Voltage Range	MODE	Internally Limited		V
V <sub>DOCMAX</sub>	Maximum D_OC Pin Voltage Range	D_OC		5.5	V
I <sub>DOCMAX</sub>	Maximum D_OC Pin Sink Current	D_OC		10	mA
V <sub>ENMAX</sub>	Maximum Enable Pin Voltage Range	EN/UVLO		20	V
V <sub>FLTBMAX</sub>	Maximum GOK/FLT Pin Voltage Range	GOK/FLT		5.5	V
I <sub>FLTBMAX</sub>	Maximum GOK/FLT Pin Sink Current	GOK/FLT		10	mA
V <sub>PGMAX</sub>	Maximum PG Pin Voltage Range	PG		5.5	V
I <sub>PGMAX</sub>	Maximum PG Pin Sink Current	PG		10	mA
V <sub>TEMPMAX</sub>	Maximum TEMP Pin Voltage Range	TEMP		5.5	V
V <sub>ILIMMAX</sub>	Maximum ILIM pin voltage	ILIM	Internally Limited		V
V <sub>IMONMAX</sub>	Maximum IMON pin voltage	IMON	Internally Limited		V
V <sub>REGMAX</sub>	Maximum VREG pin voltage	VREG	Internally Limited		V
I <sub>MAX</sub>	Maximum Continuous Switch Current	IN to OUT	Internally Limited		A
T <sub>JMAX</sub>	Junction temperature		Internally Limited		°C
T <sub>LEAD</sub>	Maximum Soldering Temperature			300	°C
T <sub>STG</sub>	Storage temperature		-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

Parameter		Pin	MIN	MAX	UNIT
V <sub>IN</sub>	Input Voltage Range	IN	4.5	16	V
V <sub>OUT</sub>	Output Voltage Range	OUT	0	V <sub>IN</sub>	V
V <sub>EN/UVLO</sub>	Enable Pin Voltage Range	EN/UVLO	0	Min(V <sub>DD</sub> + 1 V, V <sub>IN</sub> + 1 V)	V
V <sub>DVDT</sub>	DVDT Pin Cap Voltage Rating	DVDT	4		V
V <sub>PG</sub>	PG Pin Pull-up Voltage Range	PG	0	5	V
V <sub>FLTB</sub>	GOK/FLT Pin Pull-up Voltage Range	GOK/FLT	0	5	V
V <sub>DOC</sub>	D_OC Pin Pull-up Voltage Range	D_OC	2.5	5	V
I <sub>REG</sub>	VREG pin sourcing current	VREG		1	mA
V <sub>IREF</sub>	IREF Pin Voltage Range	IREF	0.3	1.8	V
V <sub>ILIM</sub>	ILIM Pin Voltage Range	ILIM	0	3	V
V <sub>IMON</sub>	IMON Pin Voltage Range	IMON	0	3	V
I <sub>MAX</sub>	RMS Switch Current, T <sub>J</sub> ≤ 125°C	IN to OUT	0	55	A
I <sub>MAX, PLS</sub>	Peak Switch Current, T <sub>J</sub> ≤ 125°C	IN to OUT	0	70	A
C <sub>IN</sub>	Cap at Pin 7	Pin 7 to GND		100	nF
T <sub>J</sub>	Junction temperature		-40	125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1) (2)</sup>		TPS25984BX	UNIT
		RZJ (QFN)	
		32 PINS	
R <sub>θJA(eff)</sub>	Junction-to-ambient thermal resistance (effective)	16.5 <sup>(2)</sup>	°C/W
		25.2 <sup>(3)</sup>	°C/W
Ψ <sub>JT(eff)</sub>	Junction-to-top characterization parameter (effective)	0.3 <sup>(2) (3)</sup>	°C/W
Ψ <sub>JB(eff)</sub>	Junction-to-board characterization parameter (effective)	4.4 <sup>(2)</sup>	°C/W
		4.9 <sup>(3)</sup>	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Based on simulations conducted with the device mounted on a custom 8-layer PCB (4s4p) with 9 thermal vias under the device
- (3) Based on simulations conducted with the device mounted on a JEDEC 4-layer PCB (2s2p) with 9 thermal vias under the device

## 6.5 Electrical Characteristics

(Test conditions unless otherwise noted)  $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ ,  $V_{\text{IN}} = 12\text{V}$ ,  $\text{OUT} = \text{Open}$ ,  $V_{\text{EN/UVLO}} = 2\text{V}$ ,  $D_{\text{OC}} = 10\text{k}\Omega$  pull-up to 5V,  $R_{\text{ILIM}} = 1.1\text{k}\Omega$ ,  $R_{\text{IMON}} = 1.1\text{k}\Omega$ ,  $V_{\text{IREF}} = 1\text{V}$ ,  $\text{DVDT} = \text{Open}$ ,  $\text{GOK/FLT} = 10\text{k}\Omega$  pull-up to 5V,  $\text{PG} = 10\text{k}\Omega$  pull-up to 5V,  $\text{TEMP} = \text{Open}$ ,  $\text{MODE} = \text{Open}$ . All voltages referenced to GND.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>INPUT SUPPLY (IN)</b>						
$V_{\text{IN}}$	VIN input operating voltage range		4.5		16	V
$V_{\text{UVPIN(R)}}$	VIN undervoltage protection threshold	VIN Rising	4	4.25	4.5	V
$V_{\text{UVPIN(F)}}$	VIN undervoltage protection threshold	VIN Falling	3.9	4.15	4.4	V
$I_{\text{QON(IN)}}$	IN ON state quiescent current	$V_{\text{EN}} \geq V_{\text{UVLO(R)}}$		3500	4420	$\mu\text{A}$

<b>OVERTEMPERATURE PROTECTION</b>						
TSD	Thermal shutdown threshold	$T_J$ Rising		150		$^{\circ}\text{C}$
TSD <sub>HYS</sub>	Thermal shutdown hysteresis	$T_J$ Falling		12.5		$^{\circ}\text{C}$

## 6.6 Logic Interface

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>DIGITAL OVERCURRENT INDICATION (D_OC)</b>						
$R_{DOC}$	D_OC pin pull-down resistance	D_OC de-asserted Low		9		$\Omega$
$I_{DOCLKG}$	D_OC pin leakage current	D_OC asserted High	-2		2	$\mu\text{A}$
<b>FAULT INDICATION (GOK/FLT)</b>						
$R_{FLTb}$	GOK/FLT pin pull-down resistance	GOK/FLT asserted Low		9		$\Omega$

## 6.6 Logic Interface (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{FLTBLKG}$	GOK/FLT in leakage current	GOK/FLT de-asserted High	-2		2	$\mu\text{A}$
<b>POWER GOOD INDICATION (PG)</b>						
$R_{PG}$	PG pin pull-down resistance	PG de-asserted Low		9		$\Omega$
$I_{PGKG}$	PG pin leakage current	PG asserted High	-2		2	$\mu\text{A}$

## 6.7 Timing Requirements

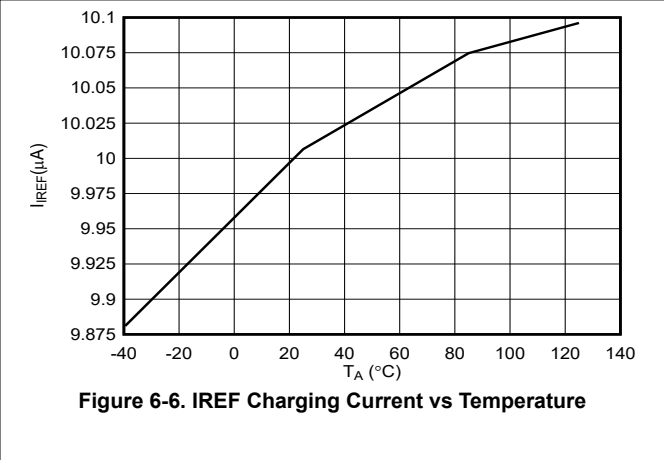

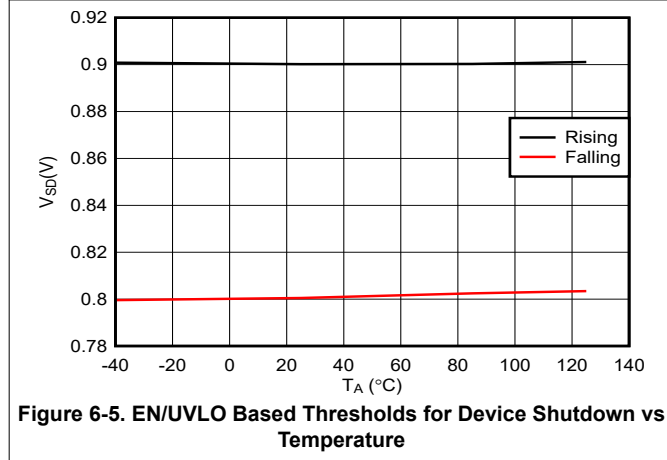

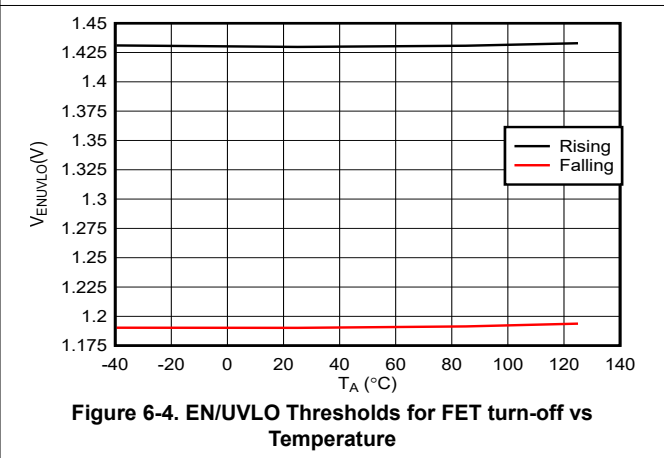

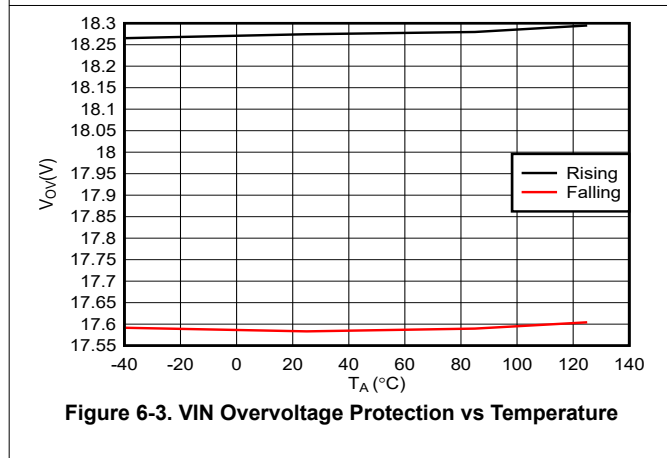

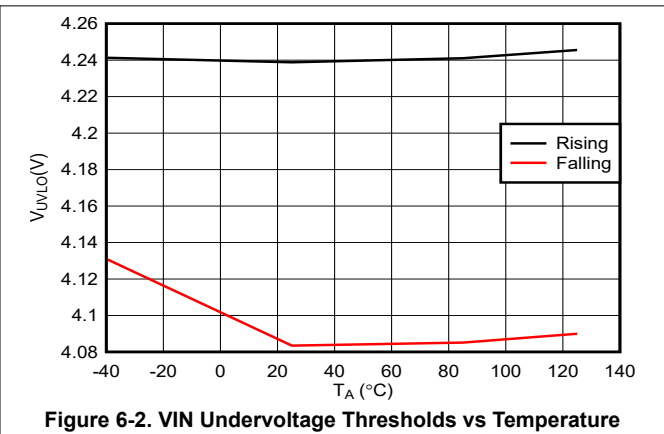

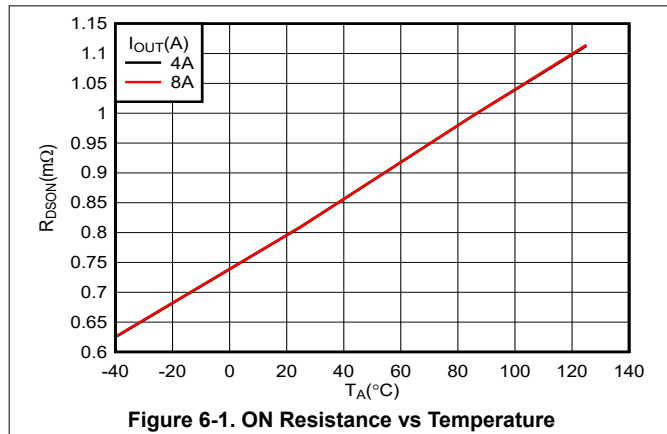

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{OVP}$	Overvoltage protection response time	$V_{IN} > V_{OVP(R)}$ to $V_{OUT}\downarrow$		1.57		$\mu\text{s}$
$t_{INDLY}$	Insertion delay	$V_{IN} > V_{UVP(R)}$ to $DVDT\uparrow$		13.7		ms
$t_{FFT}$	Fixed Fast-Trip response time	$I_{OUT} > 1.5 \times I_{FFT}$ to $I_{OUT}\downarrow$		200		ns
$t_{SFT}$	Scalable Fast-Trip response time	$I_{OUT} > 3 \times I_{OCP}$ to $I_{OUT}\downarrow$		400		ns
$t_{TIMER}$	Overcurrent blanking interval	$I_{OUT} = 1.5 \times I_{OCP}$ to $I_{OUT}\downarrow$ (TPS25984B0/1/2 variants)		400		$\mu\text{s}$
		$I_{OUT} = 1.5 \times I_{OCP}$ to $I_{OUT}\downarrow$ (TPS25984B3 variants)		3.2		ms
$t_{RST}$	Auto-Retry Interval	Auto-retry variant		105		ms
$t_{EN(DG)}$	EN/UVLO de-glitch time			6		$\mu\text{s}$
$t_{SU\_TMR}$	Start-up timeout interval	SWEN $\uparrow$ to FLT $\downarrow$		215		ms
$t_{QOD}$	QOD enable timer	$V_{SD(F)} < V_{EN/UVLO} < V_{UVLO(F)}$		4.66		ms
$t_{Discharge}$	QOD discharge time (90% to 10% of $V_{OUT}$ )	$V_{SD(F)} < V_{EN/UVLO} < V_{UVLO(F)}$ , $V_{IN} = 12\text{V}$ , $C_{OUT} = 1\text{mF}$		588		ms
$t_{PGA}$	PG assertion delay			20		$\mu\text{s}$

## 6.8 Switching Characteristics

The output rising slew rate is internally controlled and constant across the entire operating voltage range to ensure the turn on timing is not affected by the load conditions. The rising slew rate can be adjusted by adding capacitance from the dVdt pin to ground. As  $C_{dVdt}$  is increased it will slow the rising slew rate (SR). See Slew Rate and Inrush Current Control (dVdt) section for more details. The Turn-Off Delay and Fall Time, however, are dependent on the RC time constant of the load capacitance ( $C_{OUT}$ ) and Load Resistance ( $R_L$ ). The Switching Characteristics are only valid for the power-up sequence where the supply is available in steady state condition and the load voltage is completely discharged before the device is enabled. Typical values are taken at  $T_J = 25^\circ\text{C}$  unless specifically noted otherwise.  $V_{IN} = 12\text{V}$ ,  $R_{OUT} = 500\Omega$ ,  $C_{OUT} = 1\text{mF}$

PARAMETER		$C_{dVdt} = 3.3 \text{ nF}$	$C_{dVdt} = 33 \text{ nF}$	UNITS
$SR_{ON}$	Output rising slew rate B0/1/3 variant	13.54	1.65	V/ms
$SR_{ON}$	Output rising slew rate B2 variant	12.35	4.15	V/ms
$t_{D,ON}$	Turn on delay B0/1/3 variant	0.37	1.71	ms
$t_{D,ON}$	Turn on delay B2 variant	0.375	0.713	ms
$t_R$	Rise time B0/1/3 variant	0.71	5.83	ms
$t_R$	Rise time B2 variant	0.72	2.313	ms
$t_{ON}$	Turn on time B0/1/3 variant	1.078	7.541	ms

## 7 Detailed Description

### 7.1 Overview

The TPS25984Bx is an integrated hotswap protection (eFuse) device that is used to manage load voltage and load current. The device starts its operation by monitoring IN bus. When  $V_{IN}$  exceeds the Undervoltage Protection (UVP) threshold, the device waits for the insertion delay timer duration to allow the supply to stabilize before starting up. Next the device samples the EN/UVLO pin. A high level on this pin enables the internal MOSFET to start conducting and allow current to flow from IN to OUT. When EN/UVLO is held low, the internal MOSFET is turned off.

After a successful start-up sequence, the TPS25984Bx device now actively monitors its load current and input voltage, and controls the internal FET to ensure that the programmed overcurrent threshold is not exceeded and input overvoltage spikes are cut off. This action keeps the system safe from harmful levels of voltage and current. At the same time, a fixed internal overcurrent blanking timer allows the system to pass transient peaks in the load current profile without tripping the eFuse. Similarly, voltage transients on the supply line are intelligently masked to prevent nuisance trips. This feature ensures a robust protection solution against real faults which is also immune to transients, thereby ensuring maximum system uptime.

The device has integrated high accuracy and high bandwidth analog load current monitor, which allows the system to precisely monitor the load current in steady state as well as during transients. This feature facilitates the implementation of advanced dynamic platform power management techniques such as Intel® PSYS to maximize system power usage and throughput without sacrificing safety and reliability.

For systems needing higher load current support, multiple TPS25984Bx eFuses can be connected in parallel. All devices share current during start-up to avoid over-stressing some of the devices more than others which can result in premature or partial shutdown of the parallel chain.

The device has integrated protection circuits to ensure device safety and reliability under recommended operating conditions. The internal FET SOA is protected at all times using the thermal shutdown mechanism, which turns off the FET whenever the junction temperature ( $T_J$ ) becomes too high for the FET to operate safely.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

The TPS25984Bx eFuse is a compact, feature rich power management device that provides detection, protection and indication in the event of system faults.

### 7.3.1 Undervoltage Protection

The TPS25984Bx implements undervoltage lockout on VIN in case the applied voltage becomes too low for the system or device to properly operate. The undervoltage lockout has a default internal threshold of  $V_{UVLO(PIN)}$  on VIN. Alternatively, the UVLO comparator on the EN/UVLO pin allows the undervoltage protection threshold to be externally adjusted to a user defined value. Figure 7-1 and Equation 1 show how a resistor divider can be used to set the UVLO set point for a given voltage supply.

**Figure 7-1. Adjustable Undervoltage Protection**

$$V_{IN(UV)} = V_{UVLO(R)} \frac{R_1 + R_2}{R_2} \quad (1)$$

The EN/UVLO pin implements a bi-level threshold.

1.  $V_{EN} > V_{UVLO(R)}$ : Device is fully ON.
2.  $V_{SD(F)} < V_{EN} < V_{UVLO(F)}$ : The FET along with most of the controller circuitry is turned OFF, except for some critical bias and digital circuitry. Holding the EN/UVLO pin in this state for  $> t_{QOD}$  activates the Output Discharge function.
3.  $V_{EN} < V_{SD(F)}$ : All active circuitry inside the part is turned OFF and it retains no digital state memory. It also resets any latched faults. In this condition, the device quiescent current consumption is minimal.

### 7.3.2 Insertion Delay

The TPS25984Bx implements insertion delay at start-up to ensure the supply has stabilized before the device tries to turn on the power to the load. The device initially waits for the VIN supply to rise above the UVP threshold and all the internal bias voltages to settle. After that, the device remains off for an additional delay of  $t_{INSDLY}$  irrespective of the EN/UVLO pin condition. This action helps to prevent any unexpected behavior in the system if the device tries to turn on before the card has made firm contact with the backplane or if there is any supply ringing or noise during start-up.

Input supply stepped up from 0V to 12V. Device waits for  $t_{INSDLY}$  for input supply to stabilize before it turns on the output.

Figure 7-2. Insertion Delay

### 7.3.3 Overvoltage Protection

The TPS25984Bx implements overvoltage lockout to protect the load from input overvoltage conditions. The OVP comparator on the IN pin uses a fixed internal overvoltage protection threshold. If the input voltage on IN exceeds the OVP rising threshold ( $V_{OVP(R)}$ ), the power FET is turned OFF within  $t_{OVP}$ . After the voltage on IN falls below the OVP falling threshold ( $V_{OVP(F)}$ ), the FET is turned ON in a  $dV/dt$  controlled manner.

Figure 7-3. Input Overvoltage Protection Response

### 7.3.4 Inrush Current, Overcurrent, and Short-Circuit Protection

TPS25984Bx incorporates four levels of protection against overcurrent:

1. Adjustable slew rate (dVdt) for inrush current control
2. Active current limit with an adjustable threshold ( $I_{LIM}$ ) for overcurrent protection during start-up
3. Circuit-breaker with an adjustable threshold ( $I_{OCP}$ ) and fixed internal blanking timer ( $t_{TIMER}$ ) for overcurrent protection during steady-state
4. Fast-trip response to severe overcurrent faults with an adjustable threshold ( $I_{SFT} = 2 \times I_{OCP}$ ) to quickly protect against severe short-circuits under all conditions, as well as a fixed threshold ( $I_{FFT}$ ) during steady state

#### 7.3.4.1 Slew Rate (dVdt) and Inrush Current Control

During hot plug events or while trying to charge a large output capacitance, there can be a large inrush current. If the inrush current is not managed properly, the inrush current can damage the input connectors and cause the system power supply to droop. This action can lead to unexpected restarts elsewhere in the system. The inrush current during turn-on is directly proportional to the load capacitance and rising slew rate. Equation 2 can be used to find the slew rate (SR) required to limit the inrush current ( $I_{INRUSH}$ ) for a given load capacitance ( $C_{LOAD}$ ):

$$SR(V/ms) = \frac{I_{INRUSH}(A)}{C_{LOAD}(mF)} \quad (2)$$

A capacitor can be added to the dVdt pin to control the rising slew rate and lower the inrush current during turn-on. The required  $C_{dVdt}$  capacitance to produce a given slew rate can be calculated using Equation 3.

For B0/1/3 variants:

$$C_{DVDT}(pF) = \frac{51300}{SR(V/ms)} \quad (3)$$

For B2 variant:

$$C_{DVDT}(pF) = \frac{135000}{SR(V/ms)} \quad (4)$$

The fastest output slew rate is achieved by leaving the dVdt pin open.

---

#### Note

1. High input slew rates in combination with high input power path inductance can result in oscillations during start-up. This can be mitigated using one or more of the following steps:
    - a. Reduce the input inductance.
    - b. Increase the capacitance on VIN pin.
    - c. Increase the dVdt pin capacitance to reduce the slew rate or increase the start-up time. TI recommends using a minimum start-up time of 5ms.
- 

#### 7.3.4.1.1 Start-Up Time Out

If the start-up is not completed, that is, the FET is not fully turned on within a certain timeout interval ( $t_{SU\_TMR}$ ) after the device is enabled, the device registers it as a fault. GOK/FLT is asserted low and the device goes into latch-off or auto-retry mode depending on the device configuration.

#### 7.3.4.2 Steady-State Overcurrent Protection (Circuit-Breaker)

The TPS25984Bx responds to output overcurrent conditions during steady-state by performing a circuit-breaker action after an internal transient fault blanking interval. This action allows the device to support a higher peak current for a short interval but also ensures robust protection in case of persistent output faults.

The device constantly senses the output load current and provides an analog current output ( $I_{ILIM}$ ) on the ILIM pin which is proportional to the load current, which in turn produces a proportional voltage ( $V_{ILIM}$ ) across the ILIM pin resistor ( $R_{ILIM}$ ) as per [Equation 5](#).

$$V_{ILIM} = I_{OUT} \times G_{ILIM} \times R_{ILIM} \quad (5)$$

Where  $G_{ILIM}$  is the current monitor gain ( $I_{ILIM} : I_{OUT}$ )

The overcurrent condition is detected by comparing this voltage against the voltage on the IREF pin as a reference. The reference voltage ( $V_{IREF}$ ) can be controlled in two ways, which sets the overcurrent protection threshold ( $I_{OCP}$ ) accordingly.

- The internal current source interacts with the external IREF pin resistor ( $R_{IREF}$ ) to generate the reference voltage as shown in [Equation 6](#).

$$V_{IREF} = I_{IREF} \times R_{IREF} \quad (6)$$

- It is also possible to drive the IREF pin from an external low impedance reference voltage source.

The overcurrent protection threshold during steady-state ( $I_{OCP}$ ) can be calculated using [Equation 7](#).

$$I_{OCP} = \frac{0.75 \times V_{IREF}}{G_{ILIM} \times R_{ILIM}} \quad (7)$$

---

#### Note

Maintain  $V_{IREF}$  within the recommended voltage range to ensure proper operation of the overcurrent detection circuit.

TI recommends to add a 150pF capacitor from IREF pin to GND for improved noise immunity.

---

After an overcurrent condition is detected, that is the load current exceeds the programmed current limit threshold ( $I_{OCP}$ ), but stays lower than the short-circuit threshold ( $2 \times I_{OCP}$  or  $I_{FFT}$  whichever is lower), the device starts an internal blanking timer. If the load current drops below the current limit threshold before the timer expires, the circuit-breaker action is not engaged. This action allows transient load pulses to pass through the device without tripping the circuit. If the overcurrent condition persists for longer than the timer duration ( $t_{TIMER}$ ), the circuit-breaker action turns off the FET immediately.

[Equation 8](#) can be used to calculate the  $R_{ILIM}$  value for the desired overcurrent threshold.

$$R_{ILIM} = \frac{0.75 \times V_{IREF}}{G_{ILIM} \times I_{OCP}} \quad (8)$$

[Figure 7-4](#) illustrates the overcurrent response for TPS25984Bx eFuse. After the part shuts down due to a circuit-breaker fault, it either stays latched off (TPS25984B2 variant with MODE pin floating or TPS25984B0/3 variants) or restarts automatically after a fixed delay (TPS25984B2 variant with MODE pin connected to GND or TPS25984B1 variant).

**Figure 7-4. Steady-State Overcurrent (Circuit-Breaker) Response**

### 7.3.4.3 Active Current Limiting During Start-Up

The TPS25984Bx responds to output overcurrent conditions during start-up by actively limiting the current. The device constantly senses the current flowing through each one ( $I_{DEVICE}$ ) and provides an analog current output ( $I_{ILIM}$ ) on the ILIM pin, which in turn produces a proportional voltage ( $V_{ILIM}$ ) across the ILIM pin resistor ( $R_{ILIM}$ ) as per Equation 9.

$$V_{ILIM} = I_{DEVICE} \times G_{ILIM} \times R_{ILIM} \quad (9)$$

Where  $G_{ILIM}$  is the current monitor gain ( $I_{ILIM} : I_{DEVICE}$ )

The overcurrent condition is detected by comparing this voltage against a threshold which is a scaled voltage ( $CLREF_{SAT}$ ) derived from the reference voltage ( $V_{IREF}$ ) on the IREF pin as presented in Equation 10.

$$CLREF_{SAT} = 0.4 \times V_{IREF} \quad (10)$$

The reference voltage ( $V_{IREF}$ ) can be controlled in two ways, which sets the start-up current limit threshold ( $I_{LIM}$ ) accordingly.

1. In the standalone mode of operation, the internal current source interacts with the external IREF pin resistor ( $R_{IREF}$ ) to generate the reference voltage as shown in [Equation 11](#).

$$V_{IREF} = I_{IREF} \times R_{IREF} \quad (11)$$

The active current limit ( $I_{LIM}$ ) threshold during start-up can be calculated using [Equation 12](#).

$$I_{LIM} = \frac{CLREF_{SAT}}{G_{LIM} \times R_{LIM}} \quad (12)$$

When the load current through the device during start-up exceeds  $I_{LIM}$ , the device tries to regulate and hold the load current at  $I_{LIM}$ .

During current regulation, the output voltage drops, resulting in increased device power dissipation across the FET. If the device internal temperature ( $T_J$ ) exceeds the thermal shutdown threshold (TSD), the FET is turned off. After the part shuts down due to a TSD fault, it either stays latched off (TPS25984B2 variant with MODE pin floating or TPS25984B0/3 variants) or restarts automatically after a fixed delay (TPS25984B2 variant with MODE pin connected to GND or TPS25984B1 variant). See [Overtemperature protection](#) section for more details on device response to overtemperature.

---

#### Note

The active current limit block employs a foldback mechanism during start-up based on the output voltage ( $V_{OUT}$ ). When  $V_{OUT}$  is below the foldback threshold ( $V_{FB}$ ), the current limit threshold is further lowered.

---

#### 7.3.4.4 Short-Circuit Protection

During an output short-circuit event, the current through the device increases very rapidly. When an output short-circuit is detected, the internal fast-trip comparator triggers a fast protection sequence to prevent the current from building up further and causing any damage or excessive input supply droop. The fast-trip comparator employs a scalable threshold ( $I_{SFT}$ ) which is equal to  $2 \times I_{OCP}$  during steady-state and  $1.5 \times I_{LIM}$  during inrush. This action enables the user to adjust the fast-trip threshold as per system rating, rather than using a high fixed threshold which can not be suitable for all systems. After the current exceeds the fast-trip threshold, the TPS25984Bx turns off the FET within  $t_{SFT}$ . The device also employs a higher fixed fast-trip threshold ( $I_{FFT}$ ) to provide fast protection against hard short-circuits during steady-state (FET in linear region). After the current exceeds  $I_{FFT}$ , the FET is turned off completely within  $t_{FFT}$ . [Figure 7-5](#) illustrates the short-circuit response for TPS25984Bx eFuse.

In some of the systems, for example blade servers and telecom equipment which house multiple hot-pluggable blades or line cards connected to a common supply backplane, there can be transients on the supply due to switching of large currents through the inductive backplane. This can result in current spikes on adjacent cards which can potentially be large enough to trigger the fast-trip comparator of the eFuse. The TPS25984Bx uses a proprietary algorithm to avoid nuisance tripping in such cases thereby facilitating uninterrupted system operation.

After the part shuts down due to a short-circuit fault, it either stays latched off (TPS25984B2 variant with MODE pin floating or TPS25984B0/3 variants) or restarts automatically after a fixed delay (TPS25984B2 variant with MODE pin connected to GND or TPS25984B1 variant).

**Figure 7-5. Short-Circuit Response**

### 7.3.5 Analog Load Current Monitor (IMON)

The TPS25984Bx allows the system to monitor the output load current accurately by providing an analog current on the IMON pin which is proportional to the current through the FET. The benefit of having a current output is that the signal can be routed across a board without adding significant errors due to voltage drop or noise coupling from adjacent traces. The current output also allows the IMON pins of multiple TPS25984Bx devices to be tied together to get the total current of the system in a parallel eFuse configuration. The IMON signal can be converted to a voltage by dropping it across a resistor at the point of monitoring. The user can sense the voltage ( $V_{IMON}$ ) across the  $R_{IMON}$  to get a measure of the output load current using [Equation 13](#).

$$I_{OUT} = \frac{V_{IMON}}{G_{IMON} \times R_{IMON}} \quad (13)$$

The TPS25984Bx IMON circuit is designed to provide high bandwidth and high accuracy across load and temperature conditions, irrespective of board layout and other system operating conditions. This design allows the IMON signal to be used for advanced dynamic platform power management techniques such as PROCHOT™ or Intel PSYS™ to maximize system power usage and platform throughput without sacrificing safety or reliability.

**Figure 7-6. Analog Load Current Monitor Response**

**Note**

1. TI recommends using the IMON pin for load current monitoring information only during steady-state. During inrush, the IMON pin reports load current with higher error.
2. The IMON pins of multiple TPS25984Bx devices can be tied together to monitor the total system current even if the eFuses are operating independently, or in other words not connected together in a stacked or parallel configuration.
3. The ILIM pin reports the individual device load current at all times and can also be used as an analog load current monitor for each individual device.
4. Care must be taken to minimize parasitic capacitance on the ILIM pin to avoid any impact on the start-up current limit protection and short-circuit protection timing.

**7.3.6 Mode Selection (MODE)**

This pin can be used to configure the fault response behavior for the TPS25984B2 variants.

Leaving the pin open configures it as a latch-off device. Connecting this pin to GND configures it as a auto-retry device.

**7.3.7 Digital Overcurrent Indication (D\_OC)**

This is an active low output which is asserted low to indicate when the device has detected an overcurrent condition. The overcurrent detection is based on whether the load current exceeds 85% of the OCP threshold.

**7.3.8 Stacking Multiple eFuses for Scalability**

For systems needing higher current than supported by a single TPS25984Bx, multiple TPS25984Bx devices can be connected in parallel to deliver the total system current.

This configuration is achieved by connecting all the devices as follows:

1. DVDT is connected through capacitor to GND.
2. IREF is connected through resistor to GND.
3. IMON is connected through resistor to GND.
4. ILIM is connected through resistor to GND.

The following pins of all devices must be connected together:

1. IN
2. OUT
3. EN/UVLO
4. DVDT
5. D\_OC
6. IMON
7. IREF
8. GOK/ $\overline{\text{FLT}}$
9. TEMP

### 7.3.8.1 Current Balancing During Start-Up

The TPS25984Bx implements a proprietary current balancing mechanism during start-up, which allows multiple TPS25984Bx devices connected in parallel to share the inrush current and distribute the thermal stress across all the devices. This feature helps to complete a successful start-up with all the devices and avoid a scenario where some of the eFuses hit thermal shutdown prematurely. This in effect increases the inrush current capability of the parallel chain. The improved inrush performance makes it possible to support very large load capacitors on high current platforms without compromising the inrush time or system reliability.

### 7.3.9 Analog Junction Temperature Monitor (TEMP)

The device allows the system to monitor the junction temperature ( $T_J$ ) accurately by providing an analog voltage on the TEMP pin which is proportional to the temperature of the die. This voltage can be connected to the ADC input of a host controller or eFuse with digital telemetry. In a multi-device parallel configuration, the TEMP outputs of all devices can be tied together. In this configuration, the TEMP signal reports the temperature of the hottest device in the chain.

#### Note

1. The TEMP pin voltage is used only for external monitoring and does not interfere with the overtemperature protection scheme of each individual device which is based purely on the internal temperature monitor.
2. TI recommends to add a capacitance (not exceeding 100nF) on the TEMP pin to filter out glitches during system transients.
3. Adding resistive load to TEMP pin may lead to deviation from the specified VTEMP pin gain value.

### 7.3.10 Overtemperature Protection

The TPS25984Bx employs an internal thermal shutdown mechanism to protect itself when the internal FET becomes too hot to operate safely. When the TPS25984B0/3 or TPS25984B2 (with MODE pin left floating) detects thermal overload, it shuts down and remains latched-off until the device is power cycled or re-enabled. When the TPS25984B1 or TPS25984B2 (with MODE pin connected to GND) detects thermal overload, it remains off until it has cooled down sufficiently. Thereafter, the device remains off for an additional delay of  $t_{RST}$  after which it automatically retries to turn on if it is still enabled.

**Table 7-1. Overtemperature Protection Summary**

Device	Enter TSD	Exit TSD
TPS25984B0/3 (Latch-Off) or TPS25984B2 (with MODE pin left floating)	$T_J \geq TSD$	$T_J < TSD - TSD_{HYS}$ VDD cycled to 0 V and then above $V_{UVP(R)}$ or EN/UVLO toggled below $V_{SD(F)}$
TPS25984B1 (Auto-Retry) or TPS25984B2 (with MODE pin connected to GND)	$T_J \geq TSD$	$T_J < TSD - TSD_{HYS}$ $t_{RST}$ timer expired or VDD cycled to 0 V and then above $V_{UVP(R)}$ or EN/UVLO toggled below $V_{SD(F)}$

### 7.3.11 Fault Response and Indication (GOK/FLT)

GOK/FLT pin acts as an fault indicator output and also as an input to sense and synchronize faults between parallel eFuses.

Table 7-2 summarizes the device response to various fault conditions.

**Table 7-2. Fault Summary**

Event or Condition	Device Response	Fault Latched Internally	GOK/FLT Pin Status	Delay
Steady-state	None	N/A	H	
Inrush	None	N/A	H	
Overtemperature	Shutdown	Y	L	
Undervoltage (EN/UVLO)	Shutdown	N	L	
Undervoltage (VIN UVP) at startup	Shutdown	N	L	Till Insertion Delay
Undervoltage (VIN UVP) in steady state	Shutdown	N	H	
Overvoltage (VIN OVP)	Shutdown	N	L	
Transient overcurrent	None	N	H	
Persistent overcurrent (steady-state)	Circuit-Breaker	Y	L	t <sub>TIMER</sub>
Persistent overcurrent (start-up)	Current Limit	N	L	
Short-circuit	Fast-trip	Y	L	t <sub>FT</sub>
Start-up timeout	Shutdown	Y	L	t <sub>SU_TMR</sub>
FET health fault (G-S)	Shutdown	Y	L	10 μs
FET health fault (G-D)	Shutdown	Y	L	

#### Note

GOK/FLT is an open-drain pin and must be pulled up to an external supply.

For faults that are latched internally, power cycling the part or pulling the EN/UVLO pin voltage below  $V_{SD(F)}$  clears the fault and the pin is de-asserted. This action also clears the t<sub>RST</sub> timer (auto-retry mode only). Pulling the EN/UVLO just below the UVLO threshold has no impact on the device in this condition. This is true for both latch-off and auto-retry modes of operation.

### 7.3.12 Power-Good Indication (PG)

Power-Good indication is an active high output which is asserted high to indicate when the device is in steady-state and capable of delivering maximum power.

**Table 7-3. PG Indication Summary**

Event or Condition	FET Status	PG Pin Status	PG Delay
Undervoltage ( $V_{EN} < V_{UVLO}$ )	OFF	L	t <sub>PGD</sub>
$V_{IN} < V_{UVP}$	OFF	L	
Overvoltage ( $V_{IN} > V_{OVP}$ )	OFF	L	t <sub>PGD</sub>
Steady-state	ON	H	t <sub>PGA</sub>
Inrush	ON	L	t <sub>PGA</sub>

**Table 7-3. PG Indication Summary (continued)**

Event or Condition	FET Status	PG Pin Status	PG Delay
Transient overcurrent	ON	H	N/A
Circuit-breaker (persistent overcurrent followed by blanking timer expiry)	OFF	L	$t_{PGD}$
Fast-trip	OFF	L	$t_{PGD}$
Overtemperature	Shutdown	L	$t_{PGD}$

After power up, PG is pulled low initially. The device initiates an inrush sequence in which the gate driver circuit starts charging the gate capacitance from the internal charge pump. When the FET gate voltage reaches the full overdrive indicating that the inrush sequence is complete and the device is capable of delivering full power, the PG pin is asserted HIGH after a de-glitch time ( $t_{PGA}$ ).

The PG is de-asserted if the FET is turned off at any time during normal operation. The PG de-assertion de-glitch time is  $t_{PGD}$ .

**Figure 7-7. TPS25984Bx PG Timing Diagram**

**Note**

The PG is an open-drain output and is recommended to be pulled up to an external supply.

When there is no supply to the device, the PG pin is expected to stay low. However, there is no active pulldown in this condition to drive this pin all the way down to 0 V. If the PG pin is pulled up to an independent supply which is present even if the device is unpowered, there can be a small voltage seen on this pin depending on the pin sink current, which is a function of the pullup supply voltage and resistor. Minimize the sink current to keep this pin voltage low enough not to be detected as a logic HIGH by associated external circuits in this condition.

### 7.3.13 Output Discharge

The device has an integrated output discharge function which discharges the capacitors on the OUT pin using an internal constant current ( $I_{QOD}$ ) to GND. The output discharge function is activated when the EN/UVLO is held low ( $V_{SD(F)} < V_{EN} < V_{UVLO(F)}$ ) for a minimum interval ( $t_{QOD}$ ). The output discharge function helps to rapidly remove the residual charge left on large output capacitors and prevents the bus from staying at some undefined voltage for extended periods of time. The output discharge is disengaged when  $V_{OUT} < V_{FB}$  or if the device detects a fault.

The output discharge function can result in excessive power dissipation inside the device leading to an increase in junction temperature ( $T_J$ ). The output discharge is disabled if the junction temperature ( $T_J$ ) crosses TSD to avoid long-term degradation of the part.

### 7.3.14 FET Health Monitoring

The TPS25984Bx can detect and report certain conditions which are indicative of a failure of the power path FET. If undetected or unreported, these conditions can compromise system performance by not providing power to the load correctly or by not providing the necessary level of protection. After a FET failure is detected, the TPS25984Bx tries to turn off the internal FET by pulling the gate low and asserts the GOK/ $\overline{FLT}$  pin.

- **G-D short:** The TPS25984Bx detects this kind of FET failure at all times by checking if the gate voltage is close to  $V_{IN}$  even when the internal control logic is trying to hold the FET in OFF condition.
- **G-S short:** The TPS25984Bx detects this kind of FET failure during start-up by checking if the FET G-S voltage fails to reach the necessary overdrive voltage within a certain timeout period ( $t_{SU\_TMR}$ ) after the gate driver is turned ON. While in steady-state, if the G-S voltage becomes low before the controller logic has signaled to the gate driver to turn off the FET, it is latched as a fault.

## 7.4 Device Functional Modes

The features of the device depend on the operating mode. [Table 7-4](#) and [Table 7-5](#) summarize the device functional modes.

**Table 7-4. Device Functional Modes Based on EN/UVLO Pin**

Pin: EN/UVLO	Device State	Output Discharge
$> V_{UVLO(R)}$	Fully ON	Disabled
$> V_{SD(F)} , < V_{UVLO(F)} (< t_{QOD})$	FET OFF	Disabled
$> V_{SD(F)} , < V_{UVLO(F)} (> t_{QOD})$	FET OFF	Enabled
$< V_{SD(F)}$	Shutdown	Disabled

**Table 7-5. Device Functional Modes Based on MODE Pin (Only for TPS25984B2 variant)**

Pin: MODE	Device Configuration
Open	Latch-off
GND	Auto-retry

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS25984Bx is a high-current eFuse that is typically used for power rail input protection applications. The device operates from 4.5V to 16V with input overvoltage and adjustable undervoltage protection. The device provides the ability to control inrush current and offers protection against overcurrent and short-circuit conditions. The device can be used in a variety of systems such as server motherboards, add-on cards, graphics cards, accelerator cards, enterprise switches, routers, and so forth. The design procedure explained in the subsequent sections can be used to select the supporting component values based on the application requirements. Additionally, a spreadsheet design tool [TPS25984Bx Design Calculator](#) is available.

#### 8.1.1 Single Device, Standalone Operation

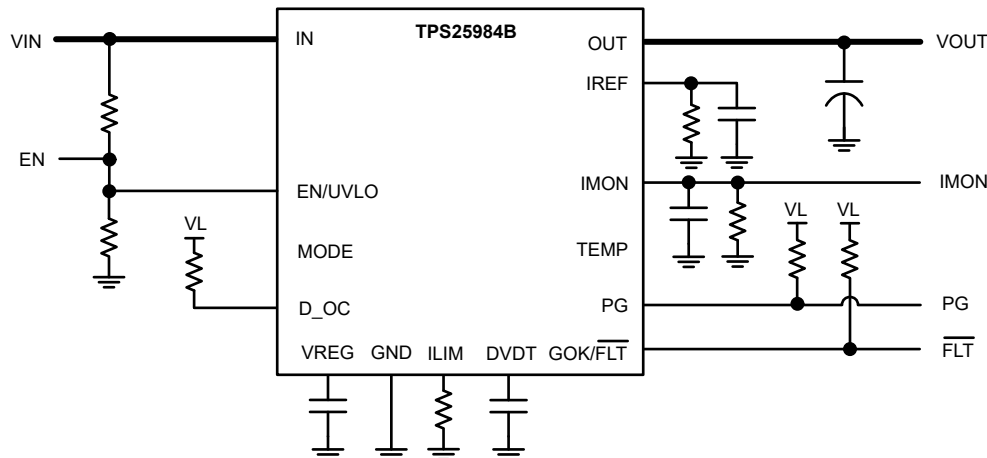

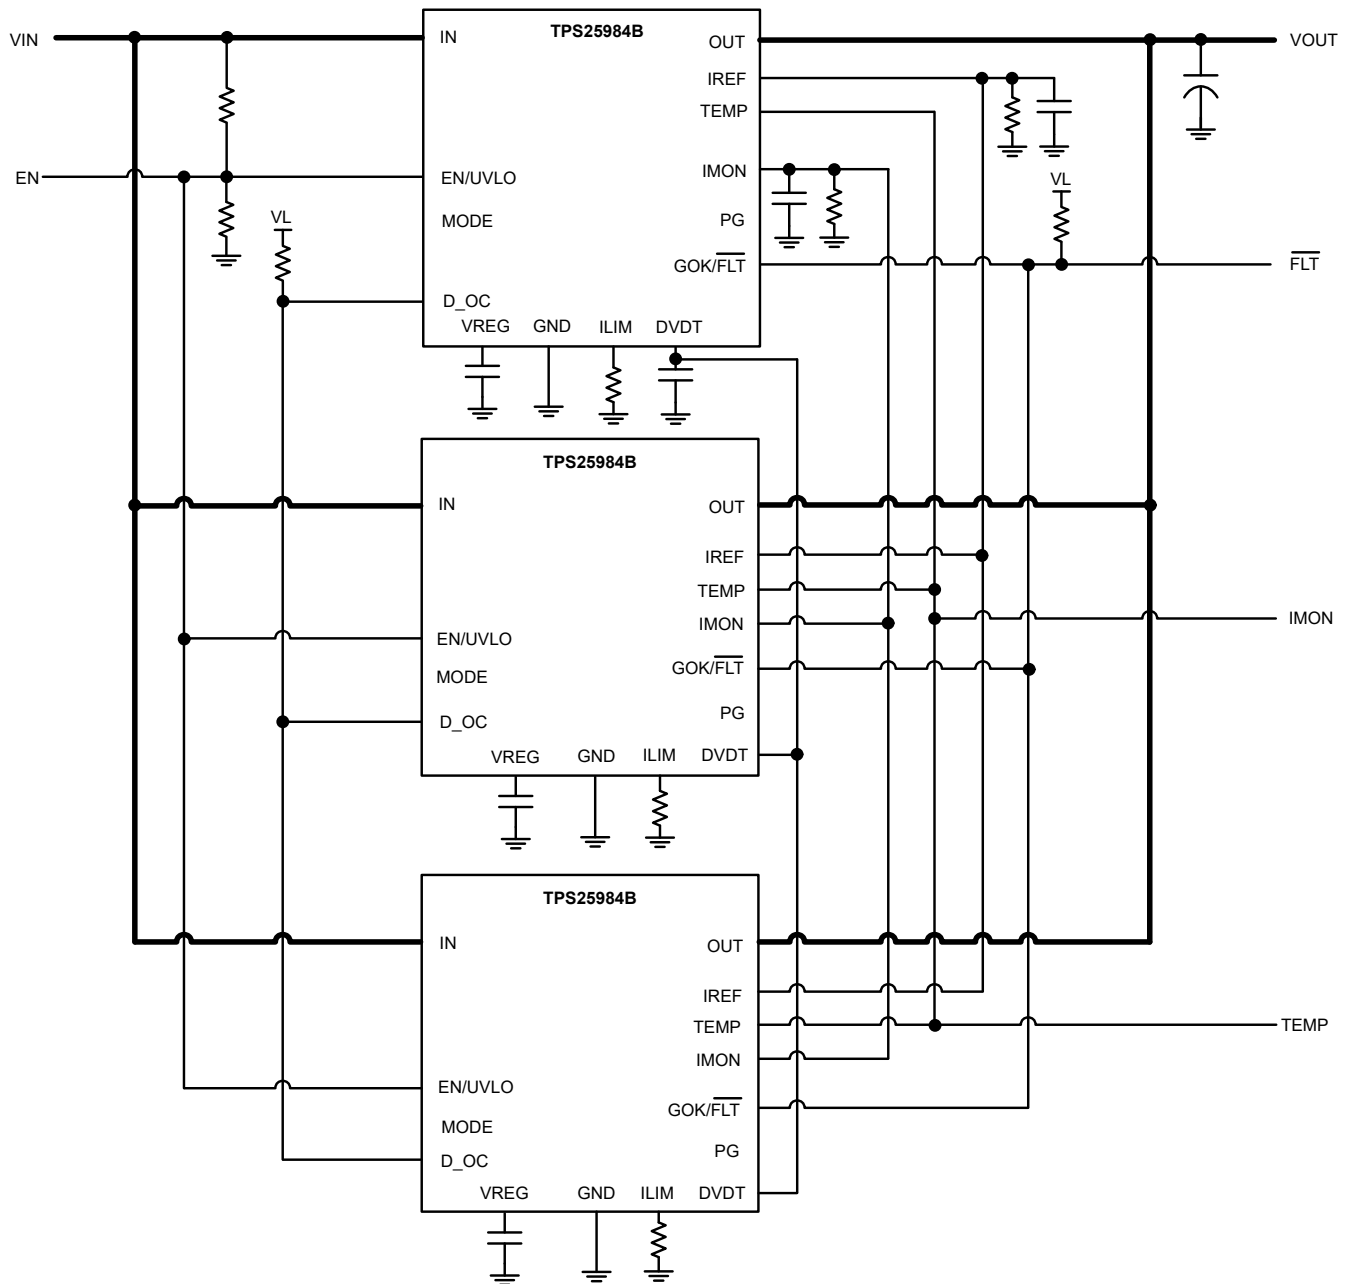

Figure 8-1. Single Device, Standalone Operation

#### Other variations:

1. The IREF pin can be driven from an external reference voltage source.
2. In a host MCU controlled system, EN/UVLO can be connected to a GPIO pin to control the device. IMON pin voltage can be monitored using an ADC. The host MCU can use a DAC to drive IREF to change the current limit threshold dynamically.
3. The device can be used as a simple high current load switch without adjustable overcurrent or fast-trip protection by tying the ILIM pin to GND and leaving the IREF pin open. The inrush current protection, fixed fast-trip and internal fixed overcurrent protection are still active in this condition.

### 8.1.2 Multiple Devices, Parallel Connection

Applications which need higher current capability can use two or more TPS25984Bx devices connected in parallel as shown in Figure 8-2.

**Figure 8-2. Devices Connected in Parallel for Higher Current Capability**

This configuration is achieved by connecting all the devices as follows:

1. DVDT is connected through capacitor to GND.
2. IREF is connected through resistor to GND.
3. IMON is connected through resistor to GND.
4. ILIM is connected through resistor to GND.

The following pins of all devices must be connected together:

1. IN
2. OUT
3. EN/UVLO
4. DVDT
5. D\_OC
6. IMON
7. IREF
8. GOK/ $\overline{\text{FLT}}$

In this configuration, all the devices are powered up and enabled simultaneously.

**Inrush:** During inrush, because the DVDT pins are tied together to a single DVDT capacitor all the devices turn on the output with the same slew rate (SR). Choose the common DVDT capacitor ( $C_{DVDT}$ ) as per the following [Equation 14](#) and [Equation 15](#).

$$SR(V/ms) = \frac{I_{INRUSH}(A)}{C_{LOAD}(mF)} \quad (14)$$

$$C_{DVDT}(pF) = \frac{N \times k}{SR(V/ms)} \quad (15)$$

Where N = number of parallel devices and k = 51300 for B0/1/3 variants, and k = 135000 for B2 variant.

In this condition, the internal balancing circuit ensures that the load current is shared among all devices during start-up. This action prevents a situation where some devices turn on faster than others and experience more thermal stress as compared to other devices. This can potentially result in premature or partial shutdown of the parallel chain, or even SOA damage to the devices. The current balancing scheme ensures the inrush capability of the chain scales according to the number of devices connected in parallel, thereby ensuring successful start-up with larger output capacitances or higher loading during start-up.

**Steady-state:** During steady-state, all devices share current based on the respective device  $R_{DS(ON)}$  and path resistance to distribute current across all the devices in the parallel chain.

**Overcurrent during steady-state:** The  $R_{ILIM}$  value for each individual eFuse must be selected based on the following [Equation 16](#).

$$R_{ILIM} = \frac{N \times 0.75 \times V_{IREF}}{G_{ILIM} \times I_{OCP(TOT)}} \quad (16)$$

Where N = number of devices in parallel, and  $I_{OCP(TOT)}$  = Total system circuit-breaker threshold

The reference voltage can be generated by connecting appropriate resistor  $R_{IREF}$  on the IREF pin.

$$V_{IREF} = N \times I_{IREF} \times R_{IREF} \quad (17)$$

#### **Other variations:**

The IREF pin can be driven from an external voltage reference ( $V_{IREF}$ ).

**Severe overcurrent (short-circuit):** If there is a severe fault at the output (for example, output shorted to ground with a low impedance path) during steady-state operation, the current builds up rapidly to a high value and triggers the fast-trip response in each device. The devices use two thresholds for fast-trip protection – a user-adjustable threshold ( $I_{SFT} = 2 \times I_{OCP}$  in steady-state or  $I_{SFT} = 1.5 \times I_{LIM}$  during inrush) as well as a fixed threshold ( $I_{FFT}$  only during steady-state). After the fast-trip, the devices enter into a latch-off fault condition till the device is power cycled or re-enabled (for TPS25984B0/3 variants) or the auto-retry timer expires (only for TPS25984B1 variant or for TPS25984B2 variant with MODE pin connected to GND).

### **8.1.3 Digital Telemetry Using External Microcontroller**

Systems which need digital telemetry, control, and configurability along with high current eFuse functionality can use TPS25984Bx devices in conjunction with a microcontroller as shown in [Figure 8-3](#).

---

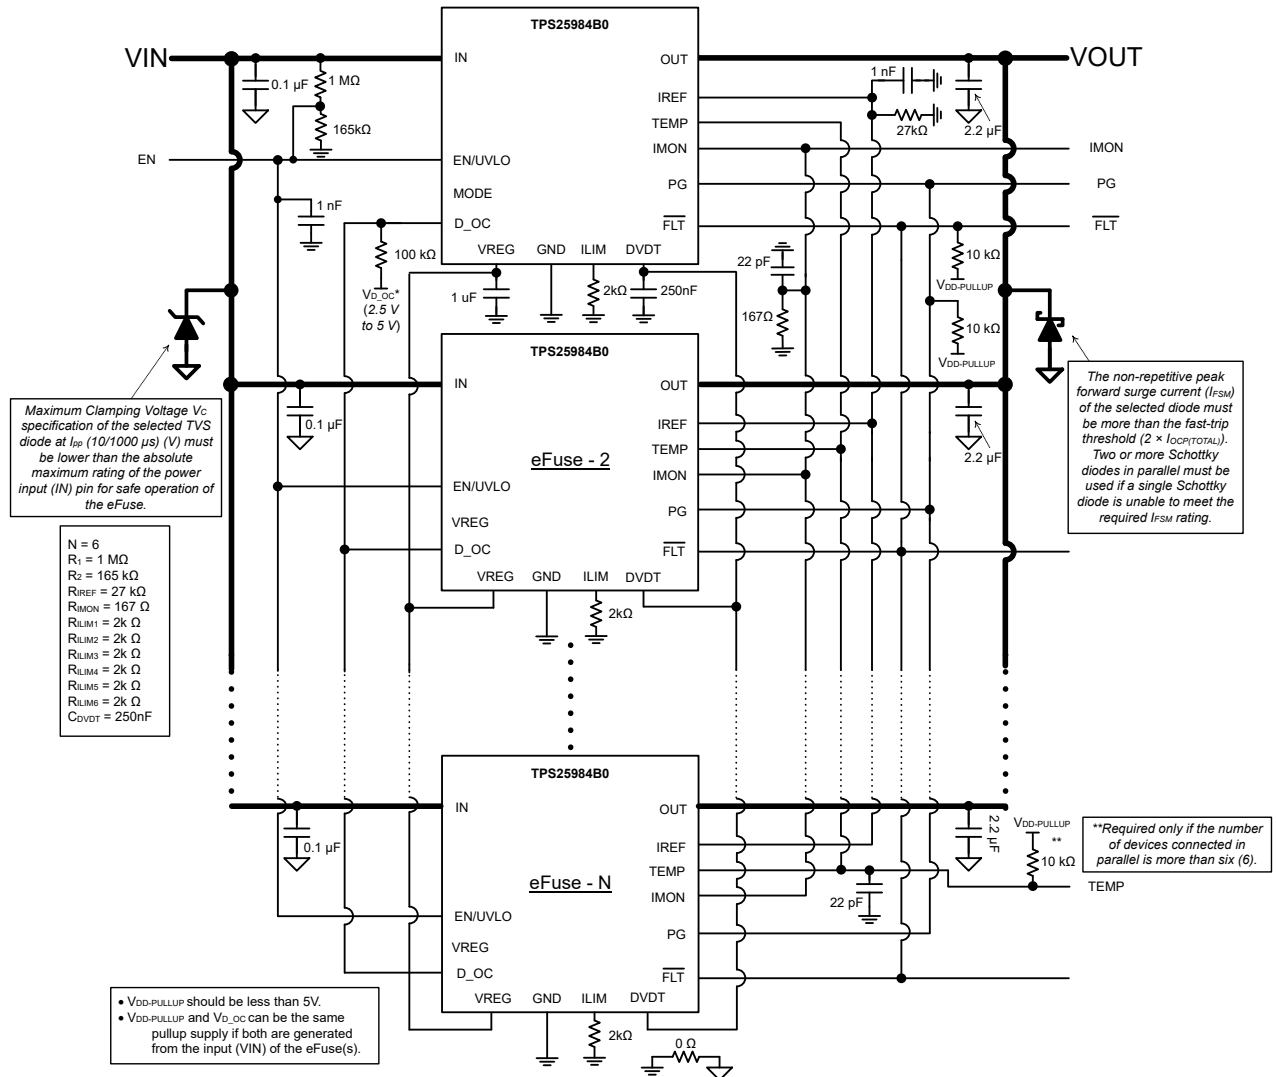

**Note**

1. The GOK/ $\overline{\text{FLT}}$  pin must be pulled up to an appropriate supply voltage as per the *Recommended Operating Conditions* table.
-

## 8.2 Typical Application: 12V, 3.3kW Power Path Protection in Data Center Servers

### 8.2.1 Application

This design example considers a 12V system operating voltage with a tolerance of  $\pm 10\%$ . The maximum steady-state load current is 275A. If the load current exceeds 480A for persistent overloads lasting longer than the fixed blanking timer of 0.4ms, the eFuse circuit must break the circuit and then latch-off. The eFuse circuit must charge a bulk capacitance of 40mF and support approximately 10% of the steady-state load during start-up. [Figure 8-4](#) shows the application schematic for this design example.

**Figure 8-4. Application Schematic for a 12V, 3.3kW Power Path Protection Circuit**

## 8.2.2 Design Requirements

Table 8-1 shows the design parameters for this application example.

**Table 8-1. Design Parameters**

PARAMETER	VALUE
Input voltage range ( $V_{IN}$ )	10.8V – 13.2V
Maximum DC load current ( $I_{OUT(max)}$ )	275A
Maximum output capacitance ( $C_{LOAD}$ )	40mF
Are all the loads off until the PG is asserted?	No
Load at start-up ( $R_{LOAD(Startup)}$ )	0.48 $\Omega$ (equivalent to approximately 10% of the maximum steady-state load)
Maximum ambient temperature	55°C
Transient overload blanking timer	0.25ms (min)
Output turn on (soft-start) time	10ms
Output voltage slew rate	1.2V/ms
Need to survive a “Hot-Short” on output condition ?	Yes
Need to survive a “power up into short” condition?	Yes
Can a board be hotplugged in or power cycled?	Yes
Load current monitoring needed?	Yes
Fault response	Latch-off

## 8.2.3 Detailed Design Procedure

- **Determining the number of eFuse devices to be used in parallel**

By factoring in a small variation in the junction to ambient thermal resistance ( $R_{\theta JA}$ ), a single TPS25984Bx eFuse is rated at a maximum steady state DC current of 55A at an ambient temperature of 70°C. Therefore, Equation 18 can be used to calculate the number of devices (N) to be in parallel to support the maximum steady state DC load current ( $I_{LOAD(max)}$ ), for which the solution must be designed.

$$N \geq \frac{I_{OUT(max)} (A)}{55A} \quad (18)$$

According to Table 8-1,  $I_{OUT(max)}$  is 275A. Therefore, six (6) TPS25984Bx eFuses are connected in parallel.

- **Selecting the  $C_{DVRT}$  capacitor to control the output slew rate and start-up time**

For a robust design, the junction temperature of the device must be kept below the absolute maximum rating during both dynamic (start-up) and steady-state conditions. Typically, dynamic power stresses are orders of magnitude greater than static stresses, so it is crucial to establish the right start-up time and inrush current limit for the capacitance in the system and the associated loads to avoid thermal shutdown during start-up.

Table 8-2 summarizes the formulas for calculating the average inrush power loss on the eFuses in the presence of different loads during start-up if the power good (PG) signal is not used to turn on all the downstream loads.

**Table 8-2. Calculation of Average Power Loss During Inrush**

Type of Loads During Start-Up	Expressions to Calculate the Average Inrush Power Loss
Only output capacitor of $C_{LOAD}$ ( $\mu\text{F}$ )	$\frac{V_{IN}^2 C_{LOAD}}{2T_{SS}} \quad (19)$
Output capacitor of $C_{LOAD}$ ( $\mu\text{F}$ ) and constant resistance of $R_{LOAD(Startup)}$ ( $\Omega$ ) with turn-ON threshold of $V_{RTH}$ (V)	$\frac{V_{IN}^2 C_{LOAD}}{2T_{SS}} + \frac{V_{IN}^2}{R_{LOAD(Startup)}} \left[ \frac{1}{6} - \left\{ \frac{1}{2} \left( \frac{V_{RTH}}{V_{IN}} \right)^2 \right\} + \left\{ \frac{1}{3} \left( \frac{V_{RTH}}{V_{IN}} \right)^3 \right\} \right] \quad (20)$
Output capacitor of $C_{LOAD}$ ( $\mu\text{F}$ ) and constant current of $I_{LOAD(Startup)}$ (A) with turn-ON threshold of $V_{CTH}$ (V)	$\frac{V_{IN}^2 C_{LOAD}}{2T_{SS}} + V_{IN} I_{LOAD(Startup)} \left[ \frac{1}{2} - \left( \frac{V_{CTH}}{V_{IN}} \right) + \left\{ \frac{1}{2} \left( \frac{V_{CTH}}{V_{IN}} \right)^2 \right\} \right] \quad (21)$
Output capacitor of $C_{LOAD}$ ( $\mu\text{F}$ ) and constant power of $P_{LOAD(Startup)}$ (W) with turn-ON threshold of $V_{PTH}$ (V)	$\frac{V_{IN}^2 C_{LOAD}}{2T_{SS}} + P_{LOAD(Startup)} \left[ \ln \left( \frac{V_{PTH}}{V_{IN}} \right) + \left( \frac{V_{PTH}}{V_{IN}} \right) - 1 \right] \quad (22)$

Where  $V_{IN}$  is the input voltage and  $T_{SS}$  is the start-up time.

With the different combinations of loads during start-up, the total average inrush power loss ( $P_{INRUSH}$ ) can be calculated using the formulas described in [Table 8-2](#). For a successful start-up, the system must satisfy the condition stated in [Equation 23](#).

$$P_{INRUSH}(W) \sqrt{T_{SS}(s)} < 10 \times N \quad (23)$$

Where  $N$  denotes the number of eFuses in parallel and  $10W\sqrt{s}$  is the SOA limit of a single TPS25984Bx eFuse. This equation can be used to obtain the maximum allowed  $T_{SS}$ .

#### Note

TI recommends to use a  $T_{SS}$  in the range of 5ms to 120ms to prevent start-up issues.

A capacitor ( $C_{DVDT}$ ) must be added at the DVDT pin to GND to set the required value of  $T_{SS}$  as calculated above. The following equations are used to compute the value of  $C_{DVDT}$ . The DVDT pins of all the eFuses in a parallel chain must be connected together.

For B0/1/3 variants:

$$C_{DVDT}(pF) = \frac{51300 \times N}{SR(V/ms)} \quad (24)$$

For B2 variant:

$$C_{DVDT}(pF) = \frac{135000 \times N}{SR(V/ms)} \quad (25)$$

In this design example,  $C_{LOAD} = 40\text{mF}$ ,  $R_{LOAD(Startup)} = 0.48\Omega$ ,  $V_{RTH} = 0\text{V}$ ,  $V_{IN} = 12\text{V}$ , and  $T_{SS} = 10\text{ms}$ .  $P_{INRUSH}$  is calculated to be  $340\text{W}$  using the equations provided in the [Table 8-2](#). It can be verified that the system satisfies condition stated in [Equation 23](#) and therefore capable of a successful start-up. If [Equation 23](#) does not hold true, start-up loads or  $T_{SS}$  must be tuned to prevent chances of thermal shutdown during start-up. Using  $V_{IN} = 12\text{V}$ ,  $T_{SS} = 10\text{ms}$ , the required  $C_{DVDT}$  value can be calculated to be  $258\text{nF}$ . The closest standard value of  $C_{DVDT}$  is  $250\text{nF}$  with 10% tolerance and DC voltage rating of  $25\text{V}$ .

### Note

In some systems, there can be active load circuits (for example, DC-DC converters) with low turn-on threshold voltages which can start drawing power before the eFuse has completed the inrush sequence. This action can cause additional power dissipation inside the eFuse during start-up and can lead to thermal shutdown. TI recommends using the Power Good (PG) pin of the eFuse to enable and disable the load circuit. This action ensures that the load is turned on only when the eFuse has completed its start-up and is ready to deliver full power without the risk of hitting thermal shutdown.

- **Selecting the  $R_{IREF}$  resistor to set the reference voltage for overcurrent protection**

In this parallel configuration, the IREF internal current source ( $I_{IREF}$ ) of all the eFuse interacts with the external IREF pin resistor ( $R_{IREF}$ ) to generate the reference voltage ( $V_{IREF}$ ) for the overcurrent protection blocks. When the voltage at the IMON pin ( $V_{IMON}$ ) is used as an input to an ADC to monitor the system current or to implement the Platform Power Control (Intel® PSYS) functionality inside the VR controller,  $V_{IREF}$  must be set to half of the maximum voltage range of the ISYS\_IN input of the controller. This action provides the necessary headroom and dynamic range for the system to accurately monitor the load current up to the fast-trip threshold ( $2 \times I_{OCP}$ ). Equation 26 is used to calculate the value of  $R_{IREF}$ .

$$V_{IREF} = I_{IREF} \times R_{IREF} \times N \quad (26)$$

In this design example,  $V_{IREF}$  is set at 1.62V. With  $I_{IREF} = 10\mu\text{A}$  (typical), we can calculate the target  $R_{IREF}$  to be 27k $\Omega$ . The closest standard value of  $R_{IREF}$  is 27k $\Omega$  with 0.1% tolerance and power rating of 100mW. For improved noise immunity, place a 1000pF ceramic capacitor from the IREF pin to GND. The IREF pins of all the eFuses in a parallel chain must be connected together.

### Note

Maintain  $V_{IREF}$  within the recommended voltage to ensure proper operation of overcurrent detection circuit.

- **Selecting the  $R_{IMON}$  resistor to monitor current through each eFuse**

TPS25984Bx eFuse continuously monitors the current flowing through it ( $I_{DEVICE}$ ) and outputs a proportional analog output current on its own ILIM pin. This in turn produces a proportional voltage ( $V_{ILIM}$ ) across the respective ILIM pin resistor ( $R_{IMON}$ ), which is expressed as:

$$V_{IMON} = I_{OUT} \times G_{IMON} \times N \times R_{IMON} \quad (27)$$

$G_{IMON}$  is the current monitor gain ( $I_{IMON} : I_{OUT}$ ), whose typical value is 10 $\mu\text{A}/\text{A}$

- **Selecting the  $R_{ILIM}$  resistor to set the overcurrent (circuit-breaker) and fast-trip thresholds during steady state and inrush current during startup**

TPS25984Bx eFuse responds to the output overcurrent conditions during steady-state by turning off the output after a fixed transient fault blanking interval. This eFuse continuously senses the total system current ( $I_{OUT}$ ) and produces a proportional analog current output ( $I_{ILIM}$ ) on the ILIM pin. This generates a voltage ( $V_{ILIM}$ ) across the ILIM pin resistor ( $R_{ILIM}$ ) in response to the load current, which is defined as Equation 27.

$$V_{ILIM} = I_{OUT} \times G_{ILIM} \times R_{ILIM} \quad (28)$$

$G_{ILIM}$  is the current monitor gain ( $I_{ILIM} : I_{OUT}$ ), whose typical value is 7.5 $\mu\text{A}/\text{A}$ . The overcurrent condition is detected by comparing the  $V_{ILIM}$  against the  $V_{IREF}$  as a threshold. The circuit-breaker threshold during steady-state ( $I_{OCP}$ ) can be calculated using Equation 29.

$$I_{OCP} = \frac{0.75 \times V_{IREF}}{G_{ILIM} \times R_{ILIM}} \quad (29)$$

In this design example,  $I_{OCP}$  is set at 480A, and  $R_{ILIM}$  can be calculated to be 2k $\Omega$  with  $G_{ILIM}$  as 7.5  $\mu$ A/A and  $V_{IREF}$  as 1.62V. The nearest value of  $R_{ILIM}$  is 2k $\Omega$  with 0.1% tolerance and power rating of 100 mW.

- **Overcurrent limit during start-up:** During inrush, the overcurrent condition for each device is detected by comparing its own load current information ( $V_{ILIM}$ ) with a scaled reference voltage as depicted in [Equation 30](#).

$$CLREF_{SAT} = 0.4 \times V_{IREF} \quad (30)$$

The current limit threshold during start-up can be calculated using [Equation 31](#).

$$I_{ILIM}(Startup) = \frac{CLREF_{SAT}}{G_{ILIM} \times R_{ILIM}} \quad (31)$$

By using a  $R_{ILIM}$  value of 2k $\Omega$  for each device, the start-up current is limited to around 43A for each device.

- **Selecting the resistors to set the undervoltage lockout threshold**

The undervoltage lockout (UVLO) threshold is adjusted by employing the external voltage divider network of  $R_1$  and  $R_2$  connected between IN, EN/UVLO, and GND pins of the device as described in [Section 7.3.1](#). The resistor values required for setting up the UVLO threshold are calculated using [Equation 32](#).

$$V_{IN(UV)} = V_{UVLO(R)} \frac{R_1 + R_2}{R_2} \quad (32)$$

To minimize the input current drawn from the power supply, TI recommends using higher resistance values for  $R_1$  and  $R_2$ . The current drawn by  $R_1$  and  $R_2$  from the power supply is  $I_{R12} = V_{IN} / (R_1 + R_2)$ . However, the leakage currents due to external active components connected to the resistor string can add errors to these calculations. So, the resistor string current,  $I_{R12}$  must be 20 times greater than the leakage current at the EN/UVLO pin ( $I_{ENLKG}$ ). From the device electrical specifications,  $I_{ENLKG}$  is 0.1 $\mu$ A (maximum) and UVLO rising threshold  $V_{UVLO(R)} = 1.52$ V (max). From the design requirements,  $V_{INUVLO} = 10.8$  V. First choose the value of  $R_1 = 1$ M $\Omega$  and use Equation 13 to calculate  $R_2 > 163.79$  k $\Omega$ . Use the closest standard 1 % resistor values:  $R_1 = 1$ M $\Omega$  and  $R_2 = 165$ k $\Omega$ . For noise reduction, place a 1000pF ceramic capacitor across the EN/UVLO pin and GND.

- **Selecting the pullup resistors and power supplies for PG and GOK/FLT pins**

GOK/FLT and PG are open-drain outputs. If these logic signals are used, the corresponding pins must be pulled up to the appropriate voltages (< 5V) through 10k $\Omega$  pullup resistances.

---

#### Note

GOK/FLT pin must be pulled up to a voltage in the range of 2.5V to 5V through a 100k $\Omega$  resistance.

---

- **Selection of TVS diode at input and Schottky diode at output**

In the case of a short circuit and overload current limit when the device interrupts a large amount of current instantaneously, the input inductance generates a positive voltage spike on the input, whereas the output inductance creates a negative voltage spike on the output. The peak amplitudes of these voltage spikes (transients) are dependent on the value of inductance in series with the input or output of the device. Such transients can exceed the absolute maximum ratings of the device and eventually lead to failures due to electrical overstress (EOS) if appropriate steps are not taken to address this issue. Typical methods for addressing this issue include:

1. Minimize lead length and inductance into and out of the device.
2. Use a large PCB GND plane.
3. Addition of the transient voltage suppressor (TVS) diodes to clamp the positive transient spike at the input.
4. Using Schottky diodes across the output to absorb negative spikes.

Refer to [TVS Clamping in Hot-Swap Circuits](#) and [Selecting TVS Diodes in Hot-Swap and ORing Applications](#) for details on selecting an appropriate TVS diode and the number of TVS diodes to be in parallel to effectively clamp the positive transients at the input below the absolute maximum ratings of the IN pin (20V). These TVS diodes also help to limit the transient voltage at the IN pin during the hot-plug event. Four (4) SMDJ12A are used in parallel in this design example.

---

**Note**

Maximum clamping voltage  $V_C$  specification of the selected TVS diode at  $I_{pp}$  (10/1000  $\mu$ s) (V) must be lower than the absolute maximum rating of the power input (IN) pin for safe operation of the eFuse.

---

Selection of the Schottky diodes must be based on the following criteria:

- The non-repetitive peak forward surge current ( $I_{FSM}$ ) of the selected diode must be more than the fast-trip threshold ( $2 \times I_{OCP(TOTAL)}$ ). Two or more Schottky diodes in parallel must be used if a single Schottky diode is unable to meet the required  $I_{FSM}$  rating. [Equation 33](#) calculates the number of Schottky diodes ( $N_{Schottky}$ ) that must be in parallel.

$$N_{Schottky} > \frac{2 \times I_{OCP(TOTAL)}}{I_{FSM}} \quad (33)$$

- Forward Voltage Drop ( $V_F$ ) at near to  $I_{FSM}$  must be as small as possible. Ideally, the negative transient voltage at the OUT pin must be clamped within the absolute maximum rating of the OUT pin ( $-1V$ ).
- DC Blocking Voltage ( $V_{RM}$ ) must be more than the maximum input operating voltage.
- Leakage current ( $I_R$ ) must be as small as possible.

Three (3) SBR10U45SP5 are used in parallel in this design example.

- **Selecting  $C_{IN}$  and  $C_{OUT}$**

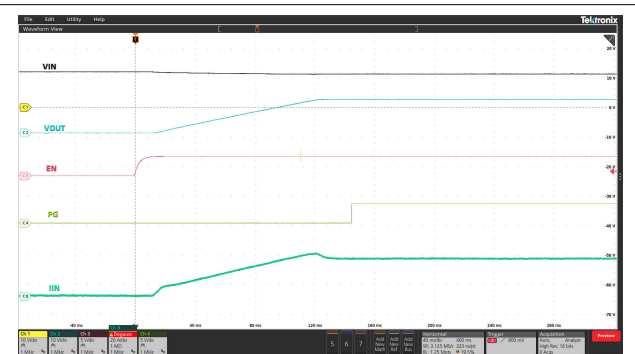

TI recommends to add ceramic bypass capacitors to help stabilize the voltages on the input and output. The value of  $C_{IN}$  must be kept small to minimize the current spike during hot-plug events. For each device, 0.1 $\mu$ F of  $C_{IN}$  is a reasonable target. Because  $C_{OUT}$  does not get charged during hot-plug, a larger value such as 2.2 $\mu$ F can be used at the OUT pin of each device.

### 8.2.4 Application Curves

All the waveforms below are captured on an evaluation setup with six (6) TPS25984Bx eFuses in parallel. All the pullup supplies are derived from a separate standby rail.

**Figure 8-5. Input Hot Plug:  $V_{IN}$  Stepped Up from 0V to 12V,  $C_{LOAD} = 40\text{mF}$ ,  $C_{DVDT} = 43\text{nF}$ , and  $R_{ILIM}$  on Each Device =  $2\text{k}\Omega$**

**Figure 8-6. Start-up with EN/UVLO:  $V_{IN} = 12\text{V}$ , EN/UVLO Stepped Up From 0V to 3V,  $C_{LOAD} = 40\text{mF}$ ,  $R_{LOAD(Start-up)} = 0.48\Omega$ ,  $C_{DVDT} = 43\text{nF}$ , and  $R_{ILIM}$  on Each Device =  $2\text{k}\Omega$**

**Figure 8-7. Power Up into Short:  $V_{IN} = 12\text{V}$ , EN/UVLO Stepped Up From 0V to 3V,  $R_{IREF} = 27\text{k}\Omega$ ,  $R_{ILIM}$  on Each Device =  $2\text{k}\Omega$ , and OUT Shorted to GND**

**Figure 8-8. Circuit-Breaker Response:  $V_{IN} = 12\text{V}$ ,  $C_{LOAD} = 40\text{mF}$ ,  $R_{IMON} = 167\Omega$ ,  $R_{IREF} = 27\text{k}\Omega$ , and Load Current Stepped up From 250A to 510A**

**Figure 8-9. Output Hot-Short Response:  $V_{IN} = 12V$ ,  $R_{IMON} = 167\Omega$ ,  $R_{IREF} = 27k\Omega$ , and OUT Shorted to GND**

**Figure 8-10. Six Devices in Parallel Temperature Rise with 300A total DC Current at Room Temperature (No Air-Flow)**

### 8.3 Power Supply Recommendations

The TPS25984Bx devices are designed for a supply voltage in the range of 4.5V to 16V on the IN pin. TI recommends using a minimum capacitance of 0.1 $\mu$ F on the IN pin of each device in parallel chain to avoid coupling of high slew rates during hot plug events.

#### 8.3.1 Transient Protection

In the case of a short-circuit or circuit-breaker event when the device interrupts current flow, the input inductance generates a positive voltage spike on the input, and the output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) is dependent on the value of inductance in series to the input or output of the device. Such transients can exceed the absolute maximum ratings of the device if steps are not taken to address the issue. Typical methods for addressing transients include:

- Minimize lead length and inductance into and out of the device.
- Use a large PCB GND plane.
- Connect a Schottky diode from the OUT pin ground to absorb negative spikes.
- Connect a low ESR capacitor of 2.2 $\mu$ F or higher at the OUT pin very close to the device.
- Connect a ceramic capacitor  $C_{IN} = 0.1\mu$ F or higher at the IN pin very close to the device to dampen the rise time of input transients. The capacitor voltage rating must be at least twice the input supply voltage to be able to withstand the positive voltage excursion during inductive ringing.

The approximate value of input capacitance can be estimated with [Equation 34](#).

$$V_{SPIKE(Absolute)} = V_{IN} + I_{LOAD} \times \sqrt{\frac{L_{IN}}{C_{IN}}} \quad (34)$$

where

$V_{IN}$  is the nominal supply voltage.

$I_{LOAD}$  is the load current.

$L_{IN}$  equals the effective inductance seen looking into the source.

$C_{IN}$  is the capacitance present at the input.

- Some applications can require the addition of a Transient Voltage Suppressor (TVS) to prevent transients from exceeding the absolute maximum ratings of the device. In some cases, even if the maximum amplitude of the transients is below the absolute maximum rating of the device, a TVS can help to absorb the excessive energy dump and prevent it from creating very fast transient voltages on the input supply pin of the IC, which can couple to the internal control circuits and cause unexpected behavior.

The circuit implementation with optional protection components is shown in [Figure 8-11](#).

**Figure 8-11. Circuit Implementation with Optional Protection Components**

### 8.3.2 Output Short-Circuit Measurements

It is difficult to obtain repeatable and similar short-circuit testing results. The following contribute to variation in results:

- Source bypassing
- Input leads
- Circuit layout
- Component selection
- Output shorting method
- Relative location of the short
- Instrumentation

The actual short exhibits a certain degree of randomness because it microscopically bounces and arcs. Ensure that configuration and methods are used to obtain realistic results. Do not expect to see waveforms exactly like those in this data sheet because every setup is different.

## 8.4 Layout

### 8.4.1 Layout Guidelines

- For all applications, TI recommends a ceramic decoupling capacitor of 0.1  $\mu\text{F}$  or greater between the IN terminal and GND terminal.
- For all applications, TI recommends a ceramic decoupling capacitor of 2.2  $\mu\text{F}$  or greater between the OUT terminal and GND terminal.
- The optimal placement of the decoupling capacitor is closest to the IN and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN terminal, and the GND terminal of the IC. See Figure below for a PCB layout example.
- High current-carrying power-path connections must be as short as possible and must be sized to carry at least twice the full-load current.
- The GND terminal must be tied to the PCB ground plane at the terminal of the IC. The PCB ground must be a copper plane or island on the board.
- The IN and OUT pins are used for Heat Dissipation. Connect to as much copper area as possible with thermal vias.
- Locate the following support components close to their connection pins:
  - $R_{ILIM}$
  - $R_{IMON}$
  - $R_{IREF}$
  - $C_{dVdT}$

- $C_{VREG}$
- $C_{IN}$
- $C_{OUT}$
- Resistors for the EN/UVLO pin
- Connect the other end of the component to the GND pin of the device with shortest trace length. The trace routing for the  $C_{IN}$ ,  $C_{OUT}$ ,  $R_{IREF}$ ,  $R_{ILIM}$ ,  $R_{IMON}$ ,  $C_{VREG}$  and  $C_{dVdt}$  components to the device must be as short as possible to reduce parasitic effects on the current limit and soft-start timing. These traces must not have any coupling to switching signals on the board.
- Because the ILIM and IREF pins directly control the overcurrent protection behavior of the device, the PCB routing of these nodes must be kept away from any noisy (switching) signals.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect. These protection devices must be routed with short traces to reduce inductance. For example, TI recommends a protection Schottky diode to address negative transients due to switching of inductive loads, and it must be physically close to the OUT pins.

Figure 8-12. TPS25984Bx Two Parallel Devices Layout Example

## 9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 9.1 Documentation Support

#### 9.1.1 Related Documentation

For related documentation see the following:

- [TPS25984BEVM eFuse Evaluation Board User Guide](#)
- [TPS25984Bx Design Calculator](#)

### 9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.4 Trademarks

PROCHOT™ and Intel PSYS™ are trademarks of Intel.

TI E2E™ is a trademark of Texas Instruments.

Intel® is a registered trademark of Intel.

is a registered trademark of intel.

All trademarks are the property of their respective owners.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
December 2024	*	Initial Release

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS25984B0RZJR	ACTIVE	WQFN-FCRLF	RZJ	32	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	TPS 25984B0	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# PACKAGE OUTLINE

WQFN-FCRLF - 0.7 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

RZJ0032A

WQFN-FCRLF - 0.7 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 15X

SOLDER MASK DETAILS

4228213/B 05/2022

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

RZJ0032A

WQFN-FCRLF - 0.7 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE  
 BASED ON 0.125 MM THICK STENCIL  
 SCALE: 15X

EXPOSED PAD 33  
 75% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE

4228213/B 05/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
