

TPS56425x 3-V to 17-V Input, 4-A, Synchronous Buck Converters in SOT-563 Package

1 Features

- Configured for a wide range of applications
 - 3-V to 17-V input voltage range
 - 0.6-V to 10-V output voltage range
 - 0.6-V reference voltage
 - ±1% reference accuracy at 25°C
 - ±1.5% reference accuracy at -40°C to 125°C
 - Integrated 55.0-mΩ and 24.3-mΩ MOSFETs
 - 100-μA low quiescent current
 - 600-kHz switching frequency
 - Maximum 97% large duty cycle operation
 - Precision EN threshold voltage
 - 1.6-ms fixed typical soft-start time
- Ease of use and small solution size
 - TPS564252 Eco-mode, TPS564257 FCCM mode, TPS564255 OOA mode at light loading
 - D-CAP3™ control mode
 - Easy layout with integrated bootstrap capacitor
 - Support start-up with prebiased output
 - Open-drain power-good indicator
 - Non-latch for OV, OT, and UVLO protection
 - Hiccup mode for UV protection
 - Cycle-by-cycle OC and NOC protection
 - 1.6-mm × 1.6-mm SOT-563 package
- Create a custom design using the TPS564252 with the [WEBENCH® Power Designer](#)
- Create a custom design using the TPS564255 with the [WEBENCH® Power Designer](#)
- Create a custom design using the TPS564257 with the [WEBENCH® Power Designer](#)

2 Applications

- [WLAN/Wi-Fi access point, switch, router](#)
- [Pro-audio, surveillance, drone](#)
- [TV, STB and DVR, smart speaker](#)
- [SSD](#)
- [Electricity meter](#)

3 Description

The TPS56425x is a simple, easy-to-use, high efficiency, high power density, synchronous buck converter with input voltage ranging from 3 V to 17 V and supports up to 4-A continuous current at output voltages between 0.6 V and 10 V.

The TPS56425x employs D-CAP3 control mode to provide a fast transient response and to support low-ESR output capacitors with no requirement for external compensation. The device can support up to 97% duty cycle operation. Integrated bootstrap capacitor helps achieve single layer PCB and can save total BOM cost.

The TPS564252 operates in Eco-mode, which maintains high efficiency during light loading. The TPS564257 operates in FCCM mode, which keeps the same frequency and lower output ripple during all load conditions. The TPS564255 operates in OOA mode, which prevents audio noise generation. The device integrates complete protection through OVP, OCP, UVLO, OTP, and UVP with hiccup.

The device is available in 1.6 mm × 1.6 mm SOT-563 package. The junction temperature is specified from -40°C to 125°C.

Device Information

5 Pin Configuration and Functions

Figure 5-1. 6-Pin SOT563 DRL Package (Top View)

Table 5-1. Pin Functions

Pin		Type ⁽¹⁾	Description
Name	NO.		
VIN	1	P	Input voltage supply pin. Connect the input decoupling capacitors between VIN and GND.
SW	2	P	Switch node pin. Connect the output inductor to this pin.
GND	3	G	GND pin for the controller circuit and the internal circuitry.
PG	4	A	Open-drain power-good indicator.
EN	5	A	Enable control input. Driving EN high enables the converter.
FB	6	A	Converter feedback input. Connect to output voltage with a feedback resistor divider.

(1) A = Analog, P = Power, G = Ground

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Pin voltage ⁽²⁾	VIN	-0.3	18	V
	FB, EN, PG	-0.3	6	
	GND	-0.3	0.3	
	SW	-2	18	
	SW (transient < 20 ns)	-5.5	20	
Operating junction temperature, T _J		-40	150	°C
Storage temperature, T _{stg}		-55	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to the network ground pin.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ , all pins	±2000	V
	Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Pin voltage	VIN	3		17	V
	FB, EN, PG	-0.1		5.5	
	GND	-0.1		0.1	
	SW	-1		17	
	SW (transient < 20 ns)	-5		18	
Output current	I _{OUT}	0		4	A
Temperature	Operating junction temperature, T _J	-40		125	°C
	Storage temperature, T _{stg}	-40		150	

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DRL (SOT-563)	UNIT
		6 PINS	
R _{θJA} ⁽²⁾	Junction-to-ambient thermal resistance	137.4	°C/W
R _{θJA_effective} ⁽³⁾	Junction-to-ambient thermal resistance on EVM board	74	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	58.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	29.8	°C/W
ψ _{JT}	Junction-to-top characterization parameter	1.3	°C/W
ψ _{JB}	Junction-to-board characterization parameter	29.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The value of R_{θJA} given in this table is only valid for comparison with other packages and can not be used for design purposes. These values were simulated on a standard JEDEC board. These values do not represent the performance obtained in an actual application.
- (3) This R_{θJA_effective} is tested on TPS564252EVM board (2 layer, copper thickness is 2-oz) at V_{IN} = 12 V, V_{OUT} = 5 V, I_{OUT} = 4A, T_A = 25°C.

6.5 Electrical Characteristics

T_J = -40°C to 125°C, V_{IN} = 12 V (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT SUPPLY VOLTAGE						
V _{IN}	Input voltage range	V _{IN}	3		17	V
I _{VIN}	VIN supply current	No load, V _{EN} = 5 V, V _{FB} = 0.65 V, non-switching, ECO version		100		μA
		No load, V _{EN} = 5 V, V _{FB} = 0.65 V, non-switching, FCCM version		370		μA
		No load, V _{EN} = 5 V, V _{FB} = 0.65 V, non-switching, OOA version		370		μA
I _{INSDN}	VIN shutdown current	No load, V _{EN} = 0 V		2		μA
UVLO						
V _{IN_UVLO}	Input undervoltage lockout threshold	Rising threshold	2.80	2.92	3.00	V
		Falling threshold	2.60	2.72	2.80	V

7 Detailed Description

7.1 Overview

The TPS56425x is a 4-A integrated FET synchronous buck converter that operates from 3-V to 17-V input voltage and 0.6-V to 10-V output voltage. This device also integrates the bootstrap capacitor in an internal IC, which is helpful for easy layout. The device employs a D-CAP3 control mode that provides fast transient response with no external compensation components and an accurate feedback voltage. The proprietary D-CAP3 control mode enables low external component count, ease of design, and optimization of the power design for cost, size and efficiency. The topology provides a seamless transition between CCM operating mode at higher load condition and DCM operation mode at lighter load condition.

The Eco-mode version allows the TPS564252 to maintain high efficiency at light load. The FCCM version allows the TPS564257 to maintain a fixed switching frequency and lower voltage output ripple. The OOA version allows the TPS564255 to prevent audio noise generation. The TPS56425x is able to adapt to both low equivalent series resistance (ESR) output capacitors such as POSCAP or SP-CAP, and ultra-low ESR ceramic capacitors.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 PWM Operation and D-CAP3™ Control Mode

The main control loop of the buck is an adaptive on-time pulse width modulation (PWM) controller that supports a proprietary D-CAP3 control mode. The D-CAP3 control mode combines adaptive on-time control with an internal compensation circuit for pseudo-fixed frequency and low external component count configuration with both low-ESR and ceramic output capacitors. The device is stable even with virtually no ripple at the output. The TPS56425x also includes an error amplifier that makes the output voltage very accurate.

At the beginning of each cycle, the high-side MOSFET is turned on. This MOSFET is turned off after an internal one-shot timer expires. This one-shot duration is set proportional to the output voltage, V_{OUT} , and is inversely proportional to the converter input voltage, V_{IN} , to maintain a pseudo-fixed frequency over the input voltage

range, hence, it is called adaptive on-time control. The one-shot timer is reset and the high-side MOSFET is turned on again when the feedback voltage falls below the reference voltage. An internal ripple generation circuit is added to reference voltage to emulate the output ripple, enabling the use of very low-ESR output capacitors such as multi-layered ceramic caps (MLCC). No external current sense network or loop compensation is required for D-CAP3 control mode.

7.3.2 Eco-mode Control

The TPS564252 is designed with advanced Eco-mode to maintain high light-load efficiency. As the output current decreases from heavy load condition, the inductor current is also reduced and eventually comes to point that its ripple valley touches zero level, which is the boundary between continuous conduction and discontinuous conduction mode. The rectifying MOSFET is turned off when the zero inductor current is detected. As the load current further decreases, the converter runs into discontinuous conduction mode. The on time is kept almost the same as it was in continuous conduction mode so that it takes longer time to discharge the output capacitor with smaller load current to the level of the reference voltage. This makes the switching frequency lower, proportional to the load current, and keeps the light load efficiency high. Use the below equation to calculate the transition point to the light load operation $I_{OUT(LL)}$ current.

$$I_{OUT(LL)} = \frac{1}{2 \times L \times f_{SW}} \times \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{V_{IN}} \quad (1)$$

7.3.3 Soft Start and Prebiased Soft Start

The TPS56425x has an internal fixed 1.6-ms soft-start time. The EN default status is low. When the EN pin becomes high, the internal soft-start function begins ramping up the reference voltage to the PWM comparator.

If the output capacitor is prebiased at start-up, the devices initiate switching and start ramping up only after the internal reference voltage becomes higher than the feedback voltage, V_{FB} . This scheme makes sure that the converter ramps up smoothly into the regulation point.

7.3.4 Overvoltage Protection

The TPS56425x has the overvoltage protection feature. When the output voltage becomes higher than the OVP threshold, the OVP is triggered with a 24- μ s deglitch time. Both the high-side MOSFET and the low-side MOSFET drivers are turned off. When the overvoltage condition is removed, the device returns to switching.

7.3.5 Large Duty Operation

The TPS56425x can support large duty operations up to 97% by smoothly dropping down the switching frequency. When $V_{IN} / V_{OUT} < 1.6$ and V_{FB} is lower than internal V_{REF} , the switching frequency is allowed to smoothly drop to make t_{ON} extended to implement the large duty operation and improve the performance of the load transient. Please refer frequency test waveform in [Figure 6-9](#). The minimum switching frequency is limited to approximately 200 kHz.

7.3.6 Current Protection and Undervoltage Protection

The output overcurrent limit (OCL) is implemented using a cycle-by-cycle valley detect control circuit. The switch current is monitored during the off state by measuring the low-side FET drain-to-source voltage. This voltage is proportional to the switch current. To improve accuracy, the voltage sensing is temperature compensated.

During the on time of the high-side FET switch, the switch current increases at a linear rate determined by the following:

- V_{IN}
- V_{OUT}
- On-time
- Output inductor value

During the on time of the low-side FET switch, this current decreases linearly. The average value of the switch current is the load current, I_{OUT} . If the monitored valley current is above the OCL level, the converter maintains a low-side FET on and delays the creation of a new set pulse, even the voltage feedback loop requires one, until

the current level becomes OCL level or lower. In subsequent switching cycles, the on time is set to a fixed value and the current is monitored in the same manner.

There are some important considerations for this type of overcurrent protection. The load current is higher than the overcurrent threshold by one half of the peak-to-peak inductor ripple current. Also, when the current is being limited, the output voltage tends to fall as the demanded load current can be higher than the current available from the converter, which can cause the output voltage to fall. When the FB voltage falls below the UVP threshold voltage, the UVP comparator detects it and the device shuts down after the UVP delay time (typically 220 μ s) and restarts after the hiccup wait time (typically 14 ms). After the device enters the hiccup cycling, the hiccup on time is typically 2.2ms.

When the overcurrent condition is removed, the output voltage returns to the regulated value.

The TPS564257 is a FCCM mode part. In this mode, the device has negative inductor current at light loading. The device has NOC (negative overcurrent) protection to avoid too large negative current. NOC protection detects the valley of inductor current. When the valley value of inductor current exceeds the NOC threshold, the device turns off the low-side FET then turns on the high-side FET. When the NOC condition is removed, the device returns to normal switching.

Because the TPS564257 is a FCCM mode part, if the inductance is so small that the device trigger NOC, it causes the output voltage to be higher than target value. The minimum inductance is identified as [Equation 2](#).

$$L = \frac{V_{OUT} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right)}{2 \times \text{Frequency} \times \text{NOC}_{(\min)}} \quad (2)$$

7.3.7 Undervoltage Lockout (UVLO) Protection

UVLO protection monitors the internal regulator voltage. When the voltage is lower than UVLO threshold voltage, the device is shut off. This protection is a non-latch protection.

7.3.8 Thermal Shutdown

The device monitors the temperature of itself. If the temperature exceeds the threshold value, the device is shut off. This protection is a non-latch protection.

7.4 Device Functional Modes

7.4.1 Eco-mode Operation

The TPS564252 operates in Eco-mode, which maintains high efficiency at light loading. As the output current decreases from heavy load conditions, the inductor current is also reduced and eventually comes to a point where the rippled valley touches zero level, which is the boundary between continuous conduction and discontinuous conduction mode. The rectifying MOSFET is turned off when the zero inductor current is detected. As the load current further decreases, the converter runs into discontinuous conduction mode. The on time is kept almost the same as it was in continuous conduction mode so that it takes longer time to discharge the output capacitor with smaller load current to the level of the reference voltage. This action makes the switching frequency lower, proportional to the load current, and keeps the light load efficiency high.

7.4.2 FCCM Mode Operation

The TPS564257 operates in forced CCM (FCCM) mode, which keeps the converter operating in continuous current mode during light load conditions and allows the inductor current to become negative. During FCCM mode, the switching frequency is maintained at an almost constant level over the entire load range, which is suitable for applications requiring tight control of the switching frequency and output voltage ripple at the cost of lower efficiency under light load.

7.4.3 OOA Mode Operation

The TPS564255 is designed with Out-of-Audio™ (OOA) feature that keeps switching frequency above the audible frequency region at light load or no load conditions. Once the converter determines that there is no switching for longer than 30 μ s, it turns on the low-side MOSFET which brings VFB lower than internal VREF and initiates a new Ton cycle. This ensures that the switching frequency doesn't go lower than 25kHz typical.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The device is a typical buck DC/DC converter that is typically used to convert a higher DC voltage to a lower DC voltage with a maximum available output current of 4 A. The following design procedure can be used to select component values for TPS56425x. Alternately, the WEBENCH Power Designer software can be used to generate a complete design. The WEBENCH Power Designer software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. This section presents a simplified discussion of the design process.

8.2 Typical Application

The application schematic in Figure 8-1 was developed to meet the requirements in Table 8-1. This circuit is available as the evaluation module (EVM). The sections provide the design procedure.

Figure 8-1 shows the TPS56425x 5-V to 17-V input, 1.05-V output converter schematic.

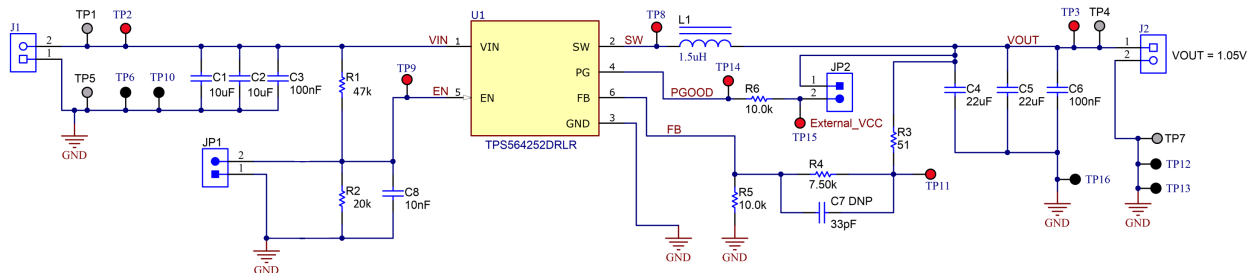

Figure 8-1. Schematic

8.2.1 Design Requirements

Table 8-1 shows the design parameters for this application.

Table 8-1. Design Parameters

Parameter	Conditions	MIN	TYP	MAX	Unit
V _{OUT}	Output voltage		1.05		V
I _{OUT}	Output current		4		A
ΔV _{OUT}	Transient response	0.4-A – 3.6-A load step, 0.8-A/μs slew rate		±3% × V _{OUT}	V
V _{IN}	Input voltage	5	12	17	V
V _{OUT(ripple)}	Output voltage ripple	CCM condition		10	mV
F _{SW}	Switching frequency		0.6		MHz
T _A	Ambient temperature		25		°C

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the TPS564252 device with the WEBENCH® Power Designer.

[Click here](#) to create a custom design using the TPS564257 device with the WEBENCH® Power Designer.

[Click here](#) to create a custom design using the TPS564255 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Output Voltage Resistors Selection

The output voltage is set with a resistor divider from the output node to the FB pin. TI recommends using 1% tolerance or better divider resistors. Start by using [Equation 3](#) to calculate V_{OUT} .

To improve efficiency at very light loads, consider using larger value resistors. If the values are too high, the regulator is more susceptible to noise and voltage errors from the FB input current are noticeable. Use a 10-k Ω resistor for R_5 to start the design.

$$V_{OUT} = 0.6 \times \left(1 + \frac{R_4}{R_5}\right) \quad (3)$$

8.2.2.3 Output Filter Selection

The LC filter used as the output filter has a double pole at [Equation 4](#). In this equation, C_{OUT} uses its effective value after derating, not its nominal value.

$$f_P = \frac{1}{2\pi\sqrt{L_{OUT} \times C_{OUT}}} \quad (4)$$

For any control topology that is compensated internally, there is a range of the output filter it can support. At low frequency, the overall loop gain is set by the output set-point resistor divider network and the internal gain of the device. The low frequency phase is 180°. At the output filter pole frequency, the gain rolls off at a –40 dB per decade rate and the phase drops has a 180 degree drop. The internal ripple generation network introduces a high-frequency zero that reduces the gain roll off from –40 dB to –20 dB per decade and leads the 90 degree phase boost. The internal ripple injection high-frequency zero is about 66kHz. The inductor and capacitor selected for the output filter is recommended such that the double pole is located approximately 20kHz, so that the phase boost provided by this high-frequency zero provides adequate phase margin for the stability requirement. The crossover frequency of the overall system is usually targeted to be less than one-third of the switching frequency (f_{SW}). For high output voltage condition, TI recommends to use 10-100pF feedforward capacitor(C_7 in [Figure 8-1](#)) for enough phase margin.

Table 8-2. Recommended Component Values

Output Voltage (V)	R4 (k Ω)	R5 (k Ω)	Typical L1 (μ H)	Typical C_{OUT} (μ F) Nominal Value Range	Recommended C_{OUT} (μ F)	Typical C_{OUT} Category	Typical C7 (pF)
0.6	0	10.0	1.2	66-154	66	MLCC, 0805, 10V	—
1.05	7.5	10.0	1.5	44-66	44	MLCC, 0805, 10V	—
2.2	26.0	10.0	2.2	22-88	44	MLCC, 0805, 10V	90
3.3	45.0	10.0	3.3	22-88	44	MLCC, 0805, 10V	30
5	220.0	30.0	4.7	22-88	44	MLCC, 0805, 10V	30

Table 8-2. Recommended Component Values (continued)

Output Voltage (V)	R4 (kΩ)	R5 (kΩ)	Typical L1 (μH)	Typical C _{OUT} (μF) Nominal Value Range	Recommended C _{OUT} (μF)	Typical C _{OUT} Category	Typical C7 (pF)
10	470	30.0	6.8	44-88	44	MLCC, 0805, 16V	36

The inductor peak-to-peak ripple current, peak current, and RMS current are calculated using [Equation 5](#), [Equation 6](#), and [Equation 7](#). Generally, TI recommends the peak-to-peak ripple current to be 20% – 50% of output average current for a comprehensive benefit of efficiency and inductor volume. The inductor saturation current rating must be greater than the calculated peak current and the RMS or heating current rating must be greater than the calculated RMS current.

$$I_{P-P} = \frac{V_{OUT}}{V_{IN(MAX)}} \times \frac{V_{IN(MAX)} - V_{OUT}}{L_O \times f_{SW}} \quad (5)$$

$$I_{PEAK} = I_O + \frac{I_{P-P}}{2} \quad (6)$$

$$I_{LO(RMS)} = \sqrt{I_O^2 + \frac{1}{12} I_{P-P}^2} \quad (7)$$

For this design example, the calculated peak current is 4.545 A and the calculated RMS current is 4.146 A. The inductor used is 74437349015 with 8-A rated current and 14.5-A saturation current.

The capacitor value and ESR determines the amount of output voltage ripple. The TPS56425x are intended for use with ceramic or other low-ESR capacitors. Use [Equation 8](#) to determine the required RMS current rating for the output capacitor.

$$I_{CO(RMS)} = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{\sqrt{12} \times V_{IN} \times L_O \times f_{SW}} \quad (8)$$

For this design, two MuRata GRM21BR61A226ME44L 22-μF output capacitors are used. The typical ESR is 2 mΩ each. The calculated RMS current is 0.32 A and each output capacitor is rated for 4 A.

8.2.2.4 Input Capacitor Selection

The TPS56425x requires an input decoupling capacitor and a bulk capacitor is needed depending on the application. TI recommends a ceramic capacitor over 10 μF for the decoupling capacitor. TI recommends an additional 0.1-μF capacitor from the VIN pin to ground to provide high frequency filtering. The capacitor voltage rating must be greater than the maximum input voltage.

8.2.3 Application Curves

The following data is tested with $V_{IN} = 12\text{ V}$, $V_{OUT} = 1.05\text{ V}$, $T_A = 25^\circ\text{C}$, unless otherwise specified.

8.3 Power Supply Recommendations

The TPS56425x are designed to operate from input supply voltages in the range of 3 V to 17 V. Buck converters require the input voltage to be higher than the output voltage for proper operation.

8.4 Layout

8.4.1 Layout Guidelines

- Keep V_{IN} and GND traces as wide as possible to reduce trace impedance. The wide areas are also an advantage from the view point of heat dissipation.
- Place the input capacitor and output capacitor as close to the device as possible to minimize trace impedance.
- Provide sufficient vias for the input capacitor and output capacitor.
- Keep the SW trace as physically short and wide as practical to minimize radiated emissions.
- Do not allow switching current to flow under the device.
- Connect a separate VOUT path to the upper feedback resistor.

- Make a Kelvin connection to the GND pin for the feedback path.
- Place a voltage feedback loop away from the high-voltage switching trace, and preferably has ground shield.
- Make the trace of the FB node as small as possible to avoid noise coupling.
- Make the GND trace between the output capacitor and the GND pin as wide as possible to minimize its trace impedance.

9 Device and Documentation Support

9.1 Device Support

9.1.1 Development Support

9.1.1.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the TPS564252 device with the WEBENCH® Power Designer.

[Click here](#) to create a custom design using the TPS564257 device with the WEBENCH® Power Designer.

[Click here](#) to create a custom design using the TPS564255 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.4 Trademarks

D-CAP3™ and TI E2E™ are trademarks of Texas Instruments.

WEBENCH® is a registered trademark of Texas Instruments.

All trademarks are the property of their respective owners.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS564252DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	Call TI SN	Level-1-260C-UNLIM	-40 to 125	4252	Samples
TPS564255DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	Call TI SN	Level-1-260C-UNLIM	-40 to 125	4255	Samples
TPS564257DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	Call TI SN	Level-1-260C-UNLIM	-40 to 125	4257	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
