## 1 Introduction

The LMR12020 evaluation module is designed to provide the power supply design engineer with a fully functional regulator design, which can be synchronized to an external clock between 1000 kHz and 2350 kHz. The evaluation module provides two output voltage options viz. 3.3 V and 5 V with a 2-A current capability. Without an external synchronization signal, the design operates at 2000 kHz, reducing the solution size and keeping switching noise out of the AM radio band. The PCB consists of four layers of copper on FR4 material. The first middle layer is a solid ground layer, which helps in minimizing the AC current loop. The LMR12020 is thermally tied to the other layers by thermal vias directly underneath the device. This user's guide contains the evaluation module schematic, a quick setup procedure, and a bill-of-materials (BOM). For complete circuit design information, see the [LMR12015/LMR12020 SIMPLE SWITCHER 20Vin, 1.5A/2A Step-Down Voltage Regulator in WSON-10 Data Sheet](#).

## 2 Features

Parameter	3.3-V Output Voltage Option	5-V Output Voltage Option
Input range	5 V to 20 V	7 V to 20 V
Output voltage	3.3 V	5 V
Output current	0 A to 2 A	0 A to 2 A
Frequency of operation	1000 kHz to 2350 kHz	1000 kHz to 2350 kHz
Default frequency of operation	2000 kHz	2000 kHz
Board size	1.944 × 1.35 inches (49.37 × 34.29 mm)	1.944 × 1.35 inches (49.37 × 34.29 mm)

## 3 Evaluation Module Schematic

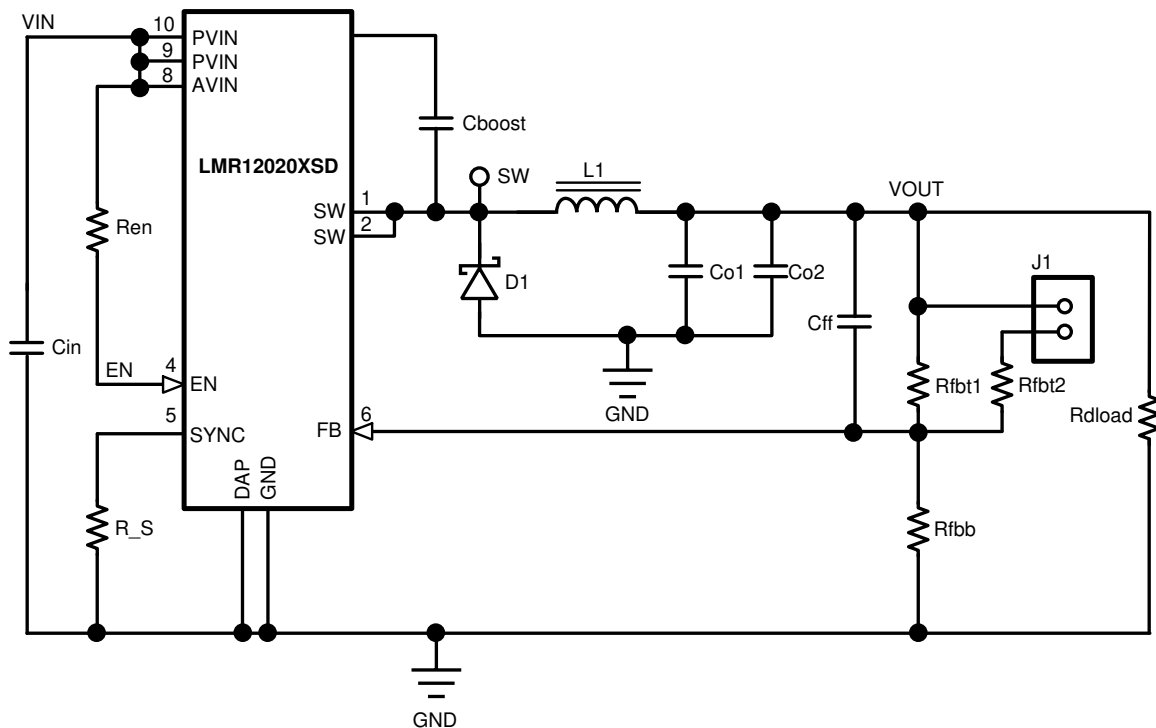

Figure 3-1. LMR12020 Evaluation Module Schematic

## 4 Powering and Loading Considerations

Read this entire section prior to attempting to power the evaluation board.

### 4.1 Quick Start Procedure

**Step 1:** Set the bench power supply current limit to 2 A. Set the power supply voltage to 12 V. Turn off the power supply output. Connect the power supply to the LMR12020 demo board. Positive connection to  $V_{IN}$  and negative connection to GND

**Step 2:** Connect a load, as high as 2 A, to the  $V_{OUT}$  terminal. Positive connection to  $V_{OUT}$  and negative connection to GND

**Step 3:** Turn on the bench power supply with no load applied to the LMR12020 and the shunt for the jumper J1 in place. The  $V_{OUT}$  would be in regulation at a nominal 3.3-V output. With the shunt out, a minimum load of 10 mA would be required to have the  $V_{OUT}$  in regulation at 5 V.

**Step 4:** Gradually increase the load and  $V_{OUT}$  should remain in regulation as the load is increased up to 2 Amps. The  $V_{OUT}$  should also be regulated when the input is swept from the minimum input to 20 V.

### 4.2 Starting Up

The EN pin is tied to  $V_{IN}$  to simplify start-up. The pullup resistor allows the power supply design engineer to toggle EN independently, if desired, and observe the start-up behavior of the LMR12020. Use the EN post to disable the device by pulling this node to GND. A logic signal can be applied to the post to test start-up and shutdown of the device.

### 4.3 Synchronization

A SYNC pin has been provided on the evaluation board. This pin can be used to synchronize the regulator to an external clock or multiple evaluation boards can be synchronized together by connecting their SYNC pins together. For complete information, see the [LMR12015/LMR12020 SIMPLE SWITCHER 20Vin, 1.5A/2A Step-Down Voltage Regulator in WSON-10 Data Sheet](#).

### 4.4 No Load Start-Up at High Output Voltage

The LMR12020 cannot start-up at no load when the output voltage goes above 3.3 V. Refer to the LMR12020 data sheet for more information regarding minimum load requirements. A position for a dummy load is provided on the board. Populating that with a 500- $\Omega$  resistor facilitates the start-up at no load for the 5-V output voltage options.

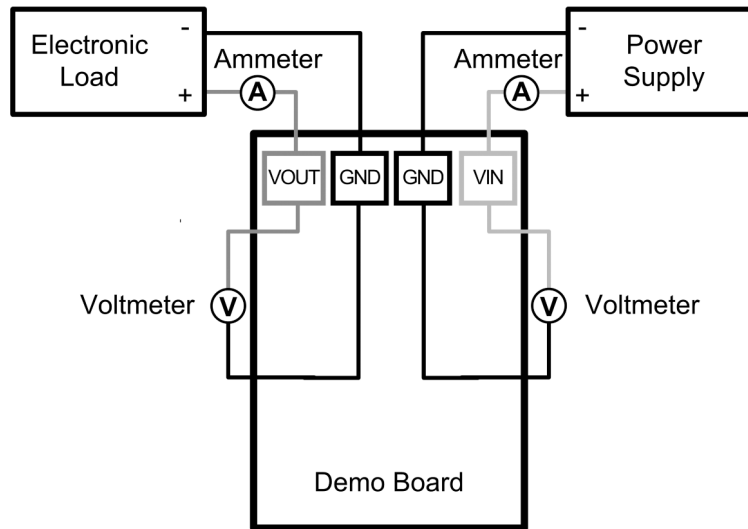

### 4.5 Adjusting the Output Voltage

The output voltage is set using the following equation where  $R_{fbb}$  is connected between the FB pin and GND, and  $R_{fbt}$  is connected between  $V_{OUT}$  and FB.

$$V_{OUT} = V_{FB}(1 + (R_{fbt}/R_{fbb})) \quad (1)$$

Adjusting the output voltage will affect the performance of the LMR12020. In addition, output capacitors might not be rated for the new output voltage. For more information, see the [LMR12015/LMR12020 SIMPLE SWITCHER 20Vin, 1.5A/2A Step-Down Voltage Regulator in WSON-10 Data Sheet](#).
